37113 **Kinetics and mechanism of the insertion of olefins into niobium- and tantalum-hydride bonds: a study of the competition between steric and electronic effects.** Burger, B.J.; Santarsiero, B.D.; Trimmer, M.S.; Bercaw, J.E. (California Institute of Technology, Pasadena (USA)). *Journal of the American Chemical Society;* **110**: No. 10, 3134-3146(11 May 1988). Contract FG03-85ER13431.

The mechanism of insertion of olefins into transition metal-hydride bonds has been examined for a series of olefin hydride complexes of niobocene, permethylniobocene, tantalocene, and permethyltantalocene. The insertion rates were measured for several meta-substituted styrene complexes of permethylniobocene and found to be comparable to those found for the para-substituted analogues, indicating that the electronic effects are largely inductive in origin. An X-ray crystal structure determination for the parent styrene complex (P/sub bca/; a = 14.626 (3) A, b = 18.134 (4) A, c = 18.147 (4) A; $\alpha, \beta, \gamma = 90°$) offers an explanation for this observation: the phenyl ring is bent out of resonance with the olefin π system by 32°. A comparison of the rates for the entire series of ethylene compounds (where steric effects are minimal) indicates that there are significant electronic effects acting within this family (k/sub Nb/ > k/sub Cp/; Cp = (eta^5-C_5H_5), Cp* = (eta^5-C_5Me_5)). In contrast to the pentamethylcyclopentadienyl systems for which steric interactions appear to dominate, the normal cyclopentadienyl compounds are virtually insensitive to sterics, allowing for the existence of two isomeric forms of the α-olefin hydride complexes (endo, olefin substituent central, and exo, olefin substituent lateral in the equatorial plane) in roughly 1:1 proportion.

37114 **Synthesis of boron carbide via poly(vinylpentaborane) precursors.** Mirabelli, M.G.L.; Sneddon, L.G. (Univ. of Pennsylvania, Philadelphia (USA)). *Journal of the American Chemical Society;* **110**: No. 10, 3305-3307(11 May 1988).

Limitations in traditional ceramic processing have encouraged interest in the development and utilization of polymer pyrolyses as low-temperature synthetic routes to nonoxide ceramic materials. Boron carbide is an example of a material where preparation from a polymer precursor might offer advantages over conventional synthetic techniques. Mixed B_4C-SiC ceramics have, in fact, been previously obtained from pyrolysis of poly(carboranesiloxane) polymers; however, a synthesis of pure B_4C from polymeric precursors has heretofore not been developed. They report here that 2-(H_2C=CH)-B_5H_8 will undergo thermal polymerization to vinylpentaborane oligomers and that these species can be converted to pure boron carbide (B_4C) in high ceramic yields under mild conditions.

37115 **New class of homoleptic 12-electron molybdenum and tungsten alkoxide clusters of formula $[M_4(OR)_{12}]$.** Chisholm, M.H.; Folting, K.; Hammond, C.E.; Hampden-Smith, M.J. (Indiana Univ., Bloomington (USA)). *Journal of the American Chemical Society;* **110**: No. 10, 3314-3315(11 May 1988).

The authors are interested in developing efficient synthetic routes to alkoxide-supported molybdenum and tungsten clusters that may prove to be excellent models for fragments of reduced oxides of the same metals. These clusters should include both coordinative unsaturation and redox flexibility at the metal centers to initiate organometallic chemistry upon substrate reduction. Complementary metal oxide model systems such as polyoxoanions may prove effective for oxidation catalysis. They have recently demonstrated that $W_2(O\text{-}i\text{-}Pr)_8$ (I) exists in reversible equilibrium with its 12-electron cluster $W_4(O\text{-}i\text{-}Pr)_{12}$ (II) in solution at room temperature, eq 1, whereas $Mo_2(O\text{-}i\text{-}Pr)_8$ is indefinitely stable with respect to cluster formation. Even by reducing the steric demands at the molybdenum center they were unable to induce the formation of new metal-metal bonds in $[Mo_2(O\text{-}i\text{-}Pr)_8(OMe)]_2$ (III), which instead retains isolated, unbridged Mo-Mo triple bonds. The authors report here the isolation and characterization of members of a new class of 12-electron tetranuclear alkoxide clusters, IV-XI, which are spectroscopically isostructural for both molybdenum and tungsten together with the single-crystal X-ray diffraction structure of one derivative, $[Mo_4(O\text{-}CH_2\text{-}c\text{-}Bu)_{12}(HO\text{-}CH_2\text{-}c\text{-}Bu)]$ (XI) (where c-Bu = cyclobutyl). This represents the first group of structurally related homoleptic alkoxide clusters for molybdenum and tungsten in oxidation state (3+).

37116 **Kinetic study of the formation of dihydrogen from the reaction of [1.1]ferrocenophanes with strong acids. 2. Tensiometry, spectrometry, and deuterium exchange studies.** Michaile, S.; Hillman, M.; Eisch, J.J. (Brookhaven National Lab., Upton, NY (USA)). *Organometallics;* **7**: No. 5, 1059-1065(May 1988). Contract AC02-76CH00016.

The kinetics of the reactions [1.1]ferrocenophane (I), 3,3'-trimethylene[1.1]ferrocenophane (II), and 2,2'-trimethylene[1.1]ferrocenophane (III) were studied by using tensiometric and spectrometric techniques at acid strengths that were lower than those used in the electrochemical investigation. The results of these measurements are consistent with the three-step mechanism proposed for the formation of dihydrogen: a very fast initial protonation, a slower second protonation, and the elimination of dihydrogen as the rate-determining step. However, at the lower acid strengths, competing reactions occur. One of these very likely involves the comproportionation of the ferrocenophane and the dication followed by the decomposition of the resulting monocation. The nature of other competing reactions remains as an open question. Kinetic studies using deuteriated acids established a primary kinetic isotope effect, k/sub H/k/sub D/, between 3 and 5, for compound I. The ring protons of the ferrocenophane undergo complete exchange in these media at a rate much faster than the rate for dihydrogen formation. No exchange of the methylene protons was observed.

37117 **Normal vibrational modes of buckminsterfullerene.** Stanton, R.E.; Newton, M.D. (Canisius College, Buffalo, NY (USA)). *Journal of Physical Chemistry;* **92**: No. 8, 2141-2145(21 Apr 1988). Contract AC02-76CH00016.

The MNDO approximation is employed to compute normal modes of vibration for the proposed C_{60} isomer known as buckminsterullerene. Group theoretical invariance theorems are derived to aid in the interpretation of the normal modes. One particularly interesting mode (the sole A/sub u/ vibration) consists of a rotary oscillation of the pentagonal rings of C_{60}, with all rings rotating in the same direction.

37118 **Kinetics of hydrogen and hydroxyl radical attack on phenol at high temperatures.** He, Y.Z.; Mallard, W.G.; Tsang, W. (National Bureau of Standards, Gaithersburg, MD (USA)). *Journal of Physical Chemistry;* **92**: No. 8, 2196-2201(21 Apr 1988).

The kinetics of hydrogen and hydroxyl radical attack on phenol have been studied in single-pulse shock tube experiments. The hydrogen atoms are formed through the unimolecular decomposition of hexamethylethane (C_8H_{18}) to two tert-butyl radicals which rapidly decompose to hydrogen atoms and isobutene. The hydrogen atoms react with phenol via abstraction of the phenolic hydrogen and displacement of OH. From the yields of isobutene and benzene the authors derive the ratio of the rate for these two processes over the temperature range 1000-1150 K and pressures between 2.5 and 5 atm. In the presence of added methane, benzene

yield is depressed due to the reaction of hydrogen with methane. Since the rate of H atom reaction with methane is known, the rate constant ratio can be used to derive absolute rate constants. Using a rate expression for $k(H + CH_4 \rightarrow CH_3 + H_2) = 2.4 \times 10^{11} \exp(-7000/T)$ L/(mol x s), they find $k(H + C_6H_5OH \rightarrow H_2 + C_6H_5O) = 1.15 \times 10^{11} \exp(-6240/T)$ L/(mol x s) and $k(H + C_6H_5OH \rightarrow C_6H_6 + OH) = 2.21 \times 10^{10} \exp(-3990/T)$ L/(mol x s). The substitution of large quantities of carbon monoxide in place of methane leads to increased yields of benzene. On the basis of $k(OH + CO \rightarrow CO_2 + H) = 7 \times 10^7 \exp(0.00092T)$ L/(mol x s), they find $k(OH + C_6H_5OH \rightarrow C_6H_5O + H_2O) = 6 \times 10^9$L/(mol x s) at 1032 K. From the equilibrium constant the rate expression for the displacement of a hydrogen atom by hydroxyl radical is $k(OH + C_6H_5OH) = 13.4 \times 10^9 \exp(-5330/T)$L/(mol x s).

37119 **Structural environments and oxidation states of metal cations in bismuth cerium molybdate solid solutions by x-ray spectroscopy.** Antonio, M.R.; Brazdil, J.F.; Glaeser, L.C.; Mehicic, M.; Teller, R.G. (BP America Research and Development, Cleveland, OH (USA)). *Journal of Physical Chemistry;* **92**: No. 8, 2338-2345(21 Apr 1988).

Bismuth and cerium L_3-edge and molybdenum K-edge X-ray absorption investigations of silica-supported bismuth cerium molybdates were undertaken to probe the local structural environments and oxidation states of the metal cations. A total of 10 single-phase compositions in the bimodal Bi/sub 2-x/Ce/sub x/$[MoO_4]_3$ solid solution (for $0 \leqq x \leqq 0.25$ and $1 \leqq x \leqq 1.5$) were examined; namely, x = 0, 0.025, 0.075, 0.125, 0.2, 0.25, 1, 1.125, 1.25, and 1.5. For low cerium concentrations ($x \leqq 0.25$), the Bi/sub 2-x/Ce/sub x/$[MeO_4]_3$ materials possess severely distorted defect-scheelite structure with cerium cations dissolved in the $Bi_2[MoO_4]_3$ (x = 0) lattice, whereas for high cerium concentrations ($x \geqq 1$), they possess undistorted defect-scheelite structures with bismuth cations dissolved in the $Ce_2[MoO_4]_3$ (x = 2) lattice. The EXAFS results provide the first quantitative structural information about the individual Bi^{3+} and Ce^{3+} sites in the Bi/sub 2-x/Ce/sub x/$[MoO_4]_3$ compositions for $0.025 \leqq x \leqq 1.5$; only site-averaged metrical parameters for an admixture of bismuth and cerium cation positions are available from X-ray and neutron diffraction measurements.

37120 **Intrinsic barriers to proton exchange between transition-metal centers: application of a weak-interaction model.** Creutz, C.; Sutin, N. (Brookhaven National Lab., Upton, NY (USA)). *Journal of the American Chemical Society;* **110**: No. 8, 2418-2427(13 Apr 1988). Contract AC02-76CH00016.

A weak-interaction model for proton self-exchange between transition-metal centers is considered. The rate constant obtained from the Fermi golden-rule expression of radiationless transition theory is a product of terms for assembling acid and base reactants at the correct orientation and distance, a classical reaction frequency, an electron-proton reaction probability, and classical nuclear factors deriving from the requirement for reorganization of ancillary ligands and solvent modes. It is found that such a model yields calculated rate constants and activation parameters in reasonable agreement with the experimental data, provided that the fluxionality of certain metal centers is taken into account.

37121 **Pressure effects on the intervalence-transfer band of salts of mixed-valence 1',1'''-disubstituted biferrocenium cations.** Sinha, U.; Lowery, M.D.; Ley, W.W.; Drickamer, H.G.; Hendrickson, D.N. (Univ. of Illinois, Urbana (USA)). *Journal of the American Chemical Society;* **110**: No. 8, 2471-2477(13 Apr 1988). Contract AC02-76ER01198.

The pressure dependence of the intervalence-transfer (IT) electronic absorption band has been determined for the mixed-valence biferrocenium and 1',1'''-diethylbiferrocenium cations intercalated into a clay and for the following eight microcrystalline compounds: biferrocenium triiodide (1); biferrocenium hexafluorophosphate (2); 1',1'''-diiodobiferrocenium triiodide (3); 1',1'''-diiodobiferrocenium dibromoiodate (4); 1',1'''-dibromobiferrocenium triiodide (5); 1',1'''-dichlorobiferrocenium triiodide hemiiodine (6); 1',1'''-diethylbiferrocenium triiodide (7); 1',1'''-di-n-butylbiferrocenium triiodide (8). Basically three different types of pressure dependencies of the energy of the IT band are seen. Compounds 3-5, which have a solid-state packing arrangement consisting of alternating stacks of cations and anions, exhibit one type of behavior. For these three compounds the IT band shifts blue initially with pressure, and above ~ 80 kbar there is the onset of a rather abrupt reversal where the IT band shifts red with increasing pressure.

37122 **Kinetics and mechanisms of α- and β-eliminations of alkoxysilanes from saturated and unsaturated carbon frameworks.** Bain, S.; Ijadi-Maghsoodi, S.; Barton, T.J. (Iowa State Univ., Ames (USA)). *Journal of the American Chemical Society;* **110**: No. 8, 2611-2614(13 Apr 1988).

Although $Me_3SiCH_2SiMe_2OMe$ undergoes thermally induced β-elimination of Me_3SiOMe to afford dimethylsilene, the thermodynamically favorable elimination of Me_3SiOMe from $Me_3SiSiMe_2CH_2OMe$ does not occur. From kinetic studies and trapping experiments, this is found to be due to a more favorable A-factor for three-centered elimination of $:CH_2$. Three-centered elimination of Me_3SiOMe from an sp^2-hybridized carbon to afford a vinylidene is found to be more facile than the analogous elimination from an sp^3-hybridized carbon due both to more favorable energy of activation and A-factor. Thus, silaallene formation from H_2-C(OMe)$SiMe_2SiMe_3$ does not occur due to the greater facility of α-elimination to $H_2C{=}C{:}$.

37123 **Determination of long distance intramolecular triplet energy transfer rates. A quantitative comparison with electron transfer.** Closs, G.L.; Piotrowiak, P.; MacInnis, J.M.; Fleming, G.R. (Univ. of Chicago, IL (USA)). *Journal of the American Chemical Society;* **110**: No. 8, 2652-2653(13 Apr 1988).

Recent efforts in these laboratories have been directed toward understanding the factors governing long distance intramolecular electron transfer (ET). In the models chosen for study the electronic coupling between donor and acceptor is sufficiently weak to assure nonadiabatic reactions. It occurred to them that long distance triplet energy transfer by the Dexter mechanism (TT) of which there are several examples in the literature should exhibit features similar to nonadiabatic electron transfer because both reactions are governed by the same theory of radiationless transitions. They therefore have started a program aimed at finding quantitative similarities and differences in these two processes when studied on directly comparable systems. Also, with one exception, the absolute rates of intramolecular triplet energy transfer have never been measured directly in liquid solution. In this communication they report their first results and conclusions.

37124 **Preparation of rhenium(VII) monoimido alkylidyne complexes and metathesis of acetylenes via rhenacyclobutadiene intermediates.** Schrock, R.R.; Weinstock, I.A.; Horton, A.D.; Liu, A.H.; Schofield, M.H. (Massachusetts Institute of Technology, Cambridge, (USA)). *Journal of the American Chemical Society;* **110**: No. 8, 2686-2687(13 Apr 1988). Contract FG05-86ER75292.

Metathesis of acetylenes by d^0 molybdenum and tungsten alkylidyne complexes of the type $M(CR)(OR')_3$ (R is alkyl, R' is alkyl, fluoroalkyl, or aryl) has been established in the last few years. An interesting question is whether a related rhenium(VII) acetylene metathesis catalyst can be designed, since although acetylene metathesis by rhenium is unknown, rhenium-based catalysts for metathesizing olefins are well-known. They report here several four-coordinate monoimido bisalkoxide neopentylidyne complexes, the metathesis of several internal acetylenes by one of them, and the X-ray structure of a rhenacyclobutadiene complex.

37125 **Tailored organometallics as precursors for the chemical vapor deposition of high-purity palladium and platinum thin films.** Gozum, J.E.; Pollina, D.M.; Jensen, J.A.; Girolami, G.S. (Univ. of Illinois, Urbana (USA)). *Journal of the American Chemical Society;* **110**: No. 8, 2688-2689(13 Apr 1988). Contract AC02-76ER01198.

The fabrication of electronic devices by chemical vapor deposition is a rapidly expanding area of great current interest. Metal-organic chemical vapor deposition (MOCVD) routes to the preparation of semiconductor thin films, such as GaAs from $GaMe_3$ and AsH_3, are becoming increasingly attractive, due largely to the high growth rates, high purity, high crystal quality, and ease of process control that are characteristic of the MOCVD method. However,

despite the intensive study of the synthesis of main-group materials by MOCVD, relatively few studies of the deposition of thin films that contain transition metals have been reported, largely because suitably volatile and reactive molecular CVD precursors are scarce. For example, palladium films are of interest as a potential replacement for gold as an electrical contact material in integrated circuits. This interest arises from its high electrical conductivity, its resistance to oxidation, and its economic advantages over gold. While palladium films have been made by electroplating, vacuum sputtering, and laser direct-write metallization, no CVD methods have been reported to date, despite the advantages offered by this technique. Here they report the synthesis of high-quality Pd and Pt films by MOCVD from tailored organometallic precursors under mild conditions.

37126 **Charge-transfer stabilization of molecular bicimers: ion pair formation in diarylmethanes.** Locke, R.J.; Modiano, S.H.; Lim, E.C. (Wayne State Univ., Detroit, MI (USA)). *Journal of Physical Chemistry;* **92**: No. 7, 1703-1705(7 Apr 1988).

The authors demonstrate here that the bicimer of aromatic hydrocarbons is stabilized largely by charge-transfer interactions. The bicimer is a dimeric species formed by the association of two identical, electronically excited molecules.

37127 **Pressure effects on the intervalence-transfer electronic absorption band of the mixed-valence Creutz-Taube ion in various media.** Hammack, W.S.; Lowery, M.D.; Hendrickson, D.N.; Drickamer, H.G. (Univ. of Illinois, Urbana (USA)). *Journal of Physical Chemistry;* **92**: No. 7, 1771-1774(7 Apr 1988). Contract AC02-76ER01198.

In this paper the authors present the results of a pressure tuning spectroscopy (PTS) study of the intervalence-transfer (IT) band of the (Cl_5 x $5H_2O$) salt of the Creutz-Taube ion. They studied this compound in three media: (1) as a crystalline solid, (2) doped in the polyelectrolyte poly(styrenesulfonic acid) (PSS), and (3) in water (D_2O). In all cases the principal effect of pressure on the IT band was found to be a shift of the band to higher energy. For the microcrystalline sample this shift was $\sim$ 400 cm^{-1} over a pressure range from 0.001 to 200 kbar (1 kbar = 986.9 atm). In this same pressure range the blue shift of the IT band for the PSS-doped sample was $\sim$ 600 cm^{-1}. In water (D_2O) the shift was $\sim$ 35 cm^{-1} in a pressure range from 0.001 to 7 kbar. In addition to the Gaussian fits described above they have fit the spectra using a vibronic coupling model developed by Piepho, Krausz, and Schatz (PKS). When analyzed in terms of this simple small-polaron model, this peak shift corresponds primarily to an increase in the electronic coupling between the metal centers of the ion. The degree of vibronic coupling changes either only slightly or not at all with pressure.

37128 **Photoelectron spectroscopy of sulfur ions.** Moran, S.; Ellison, G.B. (Univ. of Colorado, Boulder (USA)). *Journal of Physical Chemistry;* **92**: No. 7, 1794-1803(7 Apr 1988). Contract AC02-80ER10722.

Photoelectron spectra of a number of sulfur-containing negative ions have been measured, and the following electron affinities are reported: EA(S_2) = 1.670 +/- 0.015 eV, EA(HS_2) = 1.907 +/- 0.023 eV, EA(DS_2) = 1.912 +/- 0.015 eV, EA(CH_3S_2) = 1.757 +/- 0.022 eV, EA(CD_3S_2) = 1.748 +/- 0.022 eV, EA(CH_3CH_2S) = 1.947 +/- 0.013 eV, EA(CH_3SCH_2) = 0.868 +/- 0.051 eV, EA(CH_3S) = 1.871 +/- 0.012 eV, and EA(CH_2S) = 0.465 +/- 0.023 eV. For the first five anions, the photoelectron spectra consist of excitation of the S-S stretching mode of the radical. Wherever possible, the spectroscopic information obtained is used to elucidate geometries and thermochemistry of these reactive intermediates. Results from these sulfur-containing ions and radicals are compared with what is known about their oxygen analogues.

37129 **Visible and near-infrared Ge-H vibrational overtones in GeH_4.** Bernheim, R.A.; Allbee, D.C.; Lampe, F.W.; O'Keefe, J.F.; Qualey, J.R. III. (Pennsylvania State Univ., University Park (USA)). *Journal of Physical Chemistry;* **92**: No. 7, 1850-1852(7 Apr 1988).

Absorption spectra in the 11,000-18,000-cm^{-1} range have been recorded for gaseous GeH_4 by intracavity photoacoustic detection with CW dye lasers. The observed transitions correspond to Δv = 6-9 overtones of the Ge-H local mode stretch and show band contours arising from rotational structure at sample pressures of 1 atm. The local mode Ge-H stretch can be characterized by omega/sub e/ = 2178.3 +- 0.3 cm^{-1} and omega/sub e/chi/sub e/ = 33.7 +- 0.1 cm^{-1}. In addition, the Δv = 5-8 + ν_4 combinations were observed. Evidence for chemical reaction induced by the Δv = 9 excitation is also found.

37130 **Role of metastable atoms in glow discharge ionization processes.** Hess, K.R.; Harrison, W.W. (Univ. of Virginia, Charlottesville (USA)). *Analytical Chemistry;* **60**: No. 7, 691-696(1 Apr 1988).

Ionization processes have been studied in a glow discharge using neon and argon as discharge gases. A tunable laser served to depopulate metastable atom populations, and the effects were followed by optical galvanic spectroscopy and mass spectrometry. In the neon discharge, depopulation of the metastables caused a general reduction in all measured ion signals, while similar studies with argon showed that many species with ionization potentials greater than the metastable energies of argon were not affected by laser depopulation. These results provide evidence for the role of Penning ionization in the glow discharge.

37131 **Synthesis and asymmetric reactivity of enantiomerically pure cyclopentadienylmetal complexes derived from the chiral pool.** Halterman, R.L.; Vollhardt, K.P.C. (Univ. of California, Berkeley (USA)). *Organometallics;* **7**: No. 4, 883-892(Apr 1988).

Starting from pulegone, camphor, and tartrate, three chiral cyclopentadienes were prepared efficiently. Metalation with $Co_2(CO)_8$ and $TiCl_3$ resulted in new chiral and enantiomerically pure substituted cyclopentadienyldicarbonylcobalt and -titanocene complexes. The latter were used in the quantitative catalytic asymmetric hydrogenation of 2-phenyl-1-butene in up to 34% optical yield. The former allowed the first asymmetric [2 + 2 + 2] cycloadditions promoted by chiral cyclopentadienylcobalt complexes to be observed.

37132 **Clusters containing carbene ligands. 3. The transformations of a (dimethylamino)methyl ligand in a triosmium cluster. The synthesis and structural characterizations of $Os_3(CO)_{10}(\mu\text{-eta}^2\text{-}H_2CNMe_2)(\mu\text{-H})$, $Os_3(CO)_9[\mu_3\text{-eta}^2\text{-}C(H)NMe_2](\mu\text{-H})_2$, and $Os_3(CO)_{10}(\mu\text{-}CNMe_2)(\mu\text{-H})$.** Adams, R.D.; Babin, J.E. (Univ. of South Carolina, Columbia (USA)). *Organometallics;* **7**: No. 4, 963-969(Apr 1988).

The authors have recently discovered that bis(dialkylamino)-methane compounds are effective reagents for the introduction of secondary (dialkylamino)carbene ligands into osmium carbonyl clusters. They have now examined the reaction of $Os_3(CO)_{10}(\mu\text{-H})_2$ with $CH_2(NMe)_2$. This reaction yields initially the new compound $Os_3(CO)_{10}(\mu\text{-eta}^2\text{-}H_2CNMe_2)(\mu\text{-H})$ which can be transformed into the compounds $Os_3(CO)_9[\mu_3\text{-eta}^2\text{-}C(H)NMe_2](\mu\text{-H})_2$ and $Os_3(CO)_{10}(\mu\text{-}CNMe_2)(\mu\text{-H})$ through a sequence of C-H activation processes in the (dimethylamino)methyl group. The results of these studies are reported herein.

37133 **Synthesis and characterization of sodium-titanium phosphates, $Na_4(TiO)(PO_4)_2$, $Na(TiO)PO_4$, and $NaTi_2(PO_4)_3$*.** Bamberger, C.E.; Begun, G.E.; Cavin, O.B. (Oak Ridge National Lab., TN (USA)). *Journal of Solid State Chemistry;* **73**: No. 2, 317-324(Apr 1988). Contract AC05-84OR21400.

Experimental examination of part of the system Na_2O-TiO_2-P_2O_5 revealed the existence of two new sodium-titanium phosphates, $Na(TiO)(PO)_4$ and $Na(TiO)P)_4$. Their synthesis was accomplished by several different reactions and their identity was established by means of Raman spectroscopy and X-ray diffraction. Additionally, novel reactions for the synthesis of $NaTi_2(PO_4)_3$ have been demonstrated.

37134 **Synthetic and structural study of the zirconium-antimony system.** Garcia, E.; Corbett, J.D. (Iowa State Univ., Ames (USA)). *Journal of Solid State Chemistry;* **73**: No. 2, 440-451(Apr 1988). Contract W-7405-ENG-82.

Ten phases have been examined in the Zr-Sb system using arc-melting, annealing, powder sintering, vapor-phase transport, vaporization, and metal flux methods. In addition to the previous reported compositions (and structure types) Zr_3Sb (Ni_3P), Zr_5Sb_3 (Mn_5Si_3), and $ZrSb_2$), there also exist $Zr_2Sb(La_2Sb)$, high temperature Zr_5Sb_3 (Y_5Bi_3), ZrSb/sub 1-x/ (FeSi), ZrSb (ZrSb-Cmcm), and low temperature ZrSb/sub 2-x/ ($PbCl_2$). There are also phases of unknown structure near the Zr_2Sb composition at high temperatures and for Zr_2Sb_3 that are provisionally primitive orthorhombic and tetragonal, respectively. The Mn_5Si_3-type phase Zr_5Sb/sub 3+x/ is a true binary and nonstoichiometric over the ranges $0.0 \leqq x$ 0.4. Guinier lattice constant data are reported for all the phases.

37135 **Study of the crystal structures of ZrSb and β-$ZrSb_2$ and of the bonding in the two $ZrSb_2$ structures.** Garcia, E.; Corbett, J.D. (Iowa State Univ., Ames (USA)). *Journal of Solid State Chemistry;* **73**: No. 2, 452-467(Apr 1988). Contract W-7405-ENG-82.

The structures of ZrSb and β-$ZrSb_2$ have proven to be orthorhombic with, respectively, a = 3.827(1), 7.393(1) A, b = 10.426(3), 3.9780(7) A, c = 14.007(5), 9.581(1) A; space group Cmcm, Pmma; Z = 12, 4; R = 0.037, 0.032; R/sub w/ = 0.045, 0.039, for 327 and 345 independent reflections with $2\theta \leqq 55°$. The new ZrSb structure can be described in terms of sheets of interlinked cofacial trigonal prismatic chains of zirconium centered by antimony that are separated by layers of weakly bonded antimony resembling those in the element. The substoichiometric β-form of $ZrSb_2$ (ZrSb/sub 1.96) has a $PbCl_2$-type structure and contains zigzag chains of antimony atoms [d(Sb-Sb) = 2.89 A] more weakly bonded to other antimony atoms to form ribbons. Some of the same features occur in the previously known α-$ZrSb_2$ modification. The electronic interactions of the two $ZrSb_2$ structures are compared with the aid of extended-Hueckel density-of-states calculations. The heteroatomic bonding is dominant, with stronger Sb-Sb bonding in results in β-$ZrSb_2$. Significant Zr-Sb covalence, interantimony bonding, and the broad Zr-Sb valence band that results in β-$ZrSb_2$. Significant Zr-Sb covalence, interantimony bonding, and the broad Zr-Sb valence band that results in β-$ZrSb_2$ remove it from the class of simple Zintl phases. Both compounds are predicted to be metallic, and α-$ZrSb_2$ is confirmed to exhibit metallic behavior ($rho/_{298} \approx 1.2 \times 10^{-4}$ ohm cm).

37136 **Low energy consumption method for separating gaseous mixtures and in particular for medium purity oxygen production.** Jujasz, A.J.; Burkhart, J.A.; Greenberg, R. (to Dept. of Energy, Washington, DC). US Patent 4,732,597. 22 Mar 1988. Filed date 22 Apr 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A method for the separation of gaseous mixtures, the major components of which are oxygen and nitrogen, for producing medium purity oxygen is described comprising: compressing the gaseous mixture in a first compressor to super atmospheric pressure, and dividing the pressurized gaseous mixture into first and second mixture streams; cooling the first mixture stream to its boiling point and introducing the first mixture stream into the high pressure chamber of a double rectification column; compressing and cooling the second mixture stream, condensing the cooled second mixture stream, and delivering the condensed second mixture stream to the high pressure chamber of the double rectification column; separating the gaseous mixtures in the double rectification column into a liquid oxygen product stream and a gaseous nitrogen stream, removing the liquid oxygen product stream from the low pressure chamber of the double rectification column, pumping the liquid oxygen product stream to a predetermined pressure, evaporating the oxygen product stream in an evaporator-condenser, heating the oxygen product stream, and blending the oxygen product stream with a compressed blend-air stream to the desired oxygen concentration.

37137 **Intrazeolite chemistry of nickel(0) complexes and Ni(0,II) clusters studied by EXAFS, solid state NMR, and FR-IR spectroscopy.** Bein, T.; McLain, S.J.; Corbin, D.R.; Farlee, R.D.; Moller, K.; Stucky, G.D.; Woolery, G.; Sayers, D. (E.I. du Pont de Nemours and Company, Wilmington, DE (USA)). *Journal of the American Chemical Society;* **110**: No. 6, 1801-1810(16 Mar 1988). Contract AS05-80ER10742.

Adsorption, thermal decomposition, and reactivity of $NI(CO)_4$ in the cage system of dehydrated zeolite Y has been studied with EXAFS and near-edge spectroscopies, in particular monitoring changes in oxidation states and Ni ligation. $Ni(CO)_4$ is adsorbed as an intact molecule in cation-free zeolite Y, LiY, and NaY. Symmetry changes of the molecule in LiY and NaY are assigned to the formation of cation--OC-Ni bridges. Thermal treatment of the $Ni(CO)_4$NaY adduct leads to loss of CO concomitant with the formation of a bimodal Ni phase. A major part of the Ni forms small clusters (approximately 0.5 to 1.5 nm), in addition to larger crystallites (5-30 nm), sticking at the outer surface of the zeolite crystals. Oxidation of $Ni(CO)_4$NaY to NiONaY with molecular oxygen occurs almost to completion below 295 K. The small NiO particles are stable to sintering up to 670 K. Nickel-phosphineNaY adducts have been prepared by direct adsorption from solution [$Ni(CO)_3PMe_3$, $Ni(CO)_2(PMe_3)_2$], and by synthesis inside the NaY supercage [$Ni(CO)_3PMe_3$, $Ni(CO)_3(PPh_2CHMe_2)$, $Ni(CO)_3P(tau\text{-}Bu)_3$, $Ni(PMe_3)$/sub x/]. The $NaYNi(CO)_3(PPh_2CHMe_2)$ adduct is a ship-in-a bottle complex, i.e., the Ni complex is too large to exit the zeolite supercage. The substitution of carbonyl ligands by phosphines was monitored in the near-edge and EXAFS modulations as well as with ^{31}P MAS NMR. EXAFS is an excellent method to monitor ligand coordination and provides information that is complimentary to IR spectroscopy.

37138 **Synthesis and structure of the polymetallic yttrium alkoxide complex $Y_3(\mu_3\text{-}OCMe_3)(\mu_3\text{-}Cl)(\mu\text{-}OCMe_3)_3(OCMe_3)_4(THF)_2$ and related complexes: $Ln_3(\mu_3\text{-}OR)(\mu_3\text{-}X)(\mu_3\text{-}OR)_3$ building blocks in yttrium and lanthanide alkoxide chemistry.** Evans, W.J.; Sollberger, M.S.; Hanusa, T.P. (Univ. of California, Irvine (USA)). *Journal of the American Chemical Society;* **110**: No. 6, 1841-1850(16 Mar 1988).

Since factors are so important in the chemistry of yttrium and the lanthanide elements, the authors felt it was essential to obtain more structural data on the alkoxide complexes they would use as starting materials for C_5R_5 free organoyttrium and organolanthanide systems. In this report they describe the synthesis as structural features of yttrium and lanthanum alkoxide complexes which represent prototypical starting materials for synthesis of organoyttrium and organolanthanide alkoxide alkyl and hydride complexes. They have chosen Y and La because these metals are representative of late and early lanthanide chemistry, respectively, and provide diamagnetic compounds characterizable by NMR spectroscopy. To keep the spectroscopy as simple as possible they have worked exclusively with the tert-butoxide ligand which gives soluble complexes with a single ^1H NMR resonance per ligand.

37139 **Radical cation cyclization of 1,5-hexadiene to cyclohexene via the cyclohexane-2,5-diyl radical cation intermediate.** Guo, Q.X.; Qin, X.Z.; Wang, J.T.; Williams, F. (Univ. of Tennessee, Knoxville (USA)). *Journal of the American Chemical Society;* **110**: No. 6, 1974-1976(16 Mar 1988).

The classical example of a neutral carbon-centered radical cyclization reaction is the regioselective 1,5-ring closure (exocyclization) of the 5-hexenyl radical to the cyclopentylcarbinyl radical. Here the authors report the title reaction, a comparable addition process whereby an α, omega-diene radical cation reacts by endocyclization and hydrogen shift(s) to produce a cycloolefin radical cation.

37140 **Solid-surface luminescence interactions of nitrogen heterocycles adsorbed on silica gel chromatoplates submerged in chloroform/n-hexane solvents.** Burrell, G.J.; Hurtubise, R.J. (Univ. of Wyoming, Laramie (USA)). *Analytical Chemistry;* **60**: No. 6, 564-568(15 Mar 1988). Contract FG02-86ER13547.

The room-temperature fluorescence (RTF) and room-temperature phosphorescence (RTP) of benzo[f]quinoline and benzo[h]quinoline, obtained from the samples adsorbed on silica gel chromatoplates submerged in chloroform/n-hexane solvents, revealed several of the interactions of the nitrogen heterocycles with the solid matrix. The RTP results showed the emitting phosphor was protected from collisional deactivation by the matrix and that the adsorbed chloroform minimally disrupted the phosphor adsorp-

tion interactions. In addition, at least two populations of phosphors were indicated. The RTF data and RTP data showed that different interactions were occurring in the singlet state compared to the triplet state. A comparison of RTF intensity and TRP intensity as a function of chromatographic solvent strength indicated that the protonated forms of the nitrogen heterocycles in their triplet states were interacting with the matrix more strongly than the protonated forms of the nitrogen heterocycles in their singlet states.

37141 **Energy-transfer reactions of $N_2(A^3\Sigma/sub\ u/^+)$ to SO and other diatomic and polyatomic molecules.** Cao, D.Z.; Setser, D.W. (Kansas State Univ., Manhattan (USA)). *Journal of Physical Chemistry;* **92**: No. 5, 1169-1178(10 Mar 1988). Contract W-7405-ENG-48.

The total quenching rate constant of $N_2(A^3\Sigma/sub\ u/^+)$ by SO and the formation rate constant of $SO(A^3II)$ have been measured in a flow reactor by using microwave discharges of dilute $SOCl_2$Ar mixtures as sources of SO(X). The initial vibrational distribution of SO(A) was estimated by extrapolating the steady-state distributions to low pressure. Other excitation-transfer reactions of N_2(A) are summarized and compared with the SO and S_2 reactions. Total quenching rate constants of $N_2(A^3\Sigma/sub\ u/^+)$ also were measured for several diatomic halogens and for PF_3, PCl_3, $POCl_3$, NF_3, SOF_2, SO_2F_2, CCl_2F_2, CF_4, and HN_3. In several instances, effective N_2(A) decay constants also were measured for dilute mixtures of these reagents that had been passed through a microwave discharge. Unsuccessful attempts to excite $PF(A^3II)$, $PCl(A^3II)$, $PO(B^2\Sigma^+)$, and CF_2(anti $A,^1A_1$) from reaction of N_2(A) with the products from the microwave discharges in PF_3, PCl_3, $POCl_3$, and CF_2Cl_2 (and CF_4) are summarized. The rate constants for formation of $I_2(D')$ from I_2 and NH(A) from HN_3 are small. Qualitative experiments demonstrated that the N_2(A) + XeF_2 reaction does not have a significant branching fraction for XeF(B) formation.

37142 **Intramolecular coupling of eta²-iminoacyl groups at group 4 metal centers: a kinetic study of the carbon-carbon double-bond-forming reaction.** Durfee, L.D.; McMullen, A.K.; Rothwell, I.P. (Purdue Univ., West Lafayette, IN (USA)). *Journal of the American Chemical Society;* **110**: No. 5, 1463-1467(2 Mar 1988). Contract FG22-85PC80909.

The series of bis(eta²-iminoacyl) compounds of general formula $M(OAr)_2(eta^2\text{-}R'NCR)_2$ (M = Ti, Zr, Hf; OAr = 2,6-diisopropyl- and 2,6-di-tert-butylphenoxide; R = CH_3, CH_2Ph; R' = various substituted phenyls) undergo intramolecular coupling on thermolysis to produce the corresponding enediamide derivatives $M(OAr)_2[R'NC(R) = C(R)NR']$. A kinetic study of the reaction in hydrocarbon solvents has shown it to be first order. The reaction is metal dependent with the rate decreasing in the order Ti > Zr > Hf. The rate of the reaction is also dependent on the steric and electronic nature of the nitrogen substituent (R'). The use of the bulky aryl group 2,6-dimethylphenyl retards the reaction, while the use of various 3- and 4-substituted phenyls (3-F, 3-OMe, 4-OMe, 4-Cl, 4-NMe_2) shows the reaction to be accelerated by electron-withdrawing substituents. A σ plot based on kinetic data obtained at 67°C and 77°C yielded rho values of 0.83 (R = 0.97) and 0.84 (R = 0.95), respectively. Both the steric and electronic dependence of the reactivity on the nitrogen substituents is discussed mechanistically and used to rationalize the much more facile intramolecular coupling observed for the related eta²-acyl (eta²-OCR) functionalities.

37143 **Encapsulation of the transition metals chromium through cobalt in zirconium cluster iodides.** Hughbanks, T.; Rosenthal, G.; Corbett, J.D. (Iowa State Univ., Ames (USA)). *Journal of the American Chemical Society;* **110**: No. 5, 1511-1516(2 Mar 1988).

The phases $Zr_6I_{12}Cr$, $Zr_6I_{12}Mn$, $Zr_6I_{14}Fe$, $Zr_6I_{14}Co$, $CsZr_6I_{14}Mn$, Cs/sub 0.63/$Zr_6I_{14}Fe$, and Cs/sub x/$Zr_6I_{14}Co$ have been synthesized by reaction of Zr, ZrI_4, the appropriate transition-metal diiodide, and cesium iodide where appropriate at 750-850°C in sealed tantalum containers. They have the structural frameworks of $Zr_6I_{12}C$ (space group R anti 3) or $CsZr_6I_{14}C$ (Cmcs) but with the transition metal interstitial instead of carbon centered in the expanded zirconium octahedra. The structures of $CsZr_6I_{14}Mn$ and Cs/sub 0.63/$Zr_6I_{14}Fe$ were established by single-crystal X-ray diffraction methods. The zirconium-interstitial distances in the relatively large clusters are short compared with other examples, averaging 2.490 and 2.484 A, respectively. Extended Hueckel calculations for $Zr_6I_{14}Fe$ highlight the differences between transition-metal and main-group interstitial elements, the former exhibiting a preferred stability at 18 rather than 14 cluster-binding electrons through the addition of the nonbonding e/sub g/⁴ level on the interstitial. The iron-zirconium bonding in the cluster is notably greater than that in Zr_6Fe. The phase $CsZr_6I_{14}Mn$ is properly diamagnetic, while the magnetic susceptibility data for the 19-electron $Zr_6I_{12}Mn$ are well described by a high-temperature μ/sub eff/ of 1.84 μ/sub B/ and an intracluster spin-orbit coupling (zeta = 312 cm^{-1}) that partially quenches the moment at lower temperatures.

37144 **Difference in the methyl group conformational preferences of T_1 and S_1 acetophenone. A probe of the orbital character of excited electronic states.** Tomer, J.L.; Spangler, L.H.; Pratt, D.W. (Univ. of Pittsburgh, PA (USA)). *Journal of the American Chemical Society;* **110**: No. 5, 1615-1617(2 Mar 1988).

Ethane exists, in its electronic ground state, primarily in the staggered form because of the mutual repulsion between the filled π/sub CH_3/ orbitals of the two methyl groups in the higher energy eclipsed form. The same considerations dictate the more stable conformation of a methyl rotor attached to an R(-C) = X group, as in propene (R = H, X = CH_2), acetaldehyde (R = H, X = O), and acetophenone (R = phi, X = 0), all of which have a C-H bond eclipsed rather than staggered with the double bond in the ground state (S_0). But, because of the sensitivity of these nonbonding interactions to the orbital occupancies of neighboring groups, the situation might be expected to be different in electronically excited states. A realization of this expectation is reported. A difference exists in the conformational preferences of the methyl group in the lowest excited triplet (T_1) and singlet (S_1) states of acetophenone, probably because of a difference in their orbital characters. The dynamic implications of this result are discussed.

37145 **Resonance Raman spectroscopic investigation of axial coordination in M. thermoautotrophicum methyl reductase and its nickel tetrapyrrole cofactor F_{430}.** Shiemke, A.K.; Scott, R.A.; Shelnutt, J.A. (Univ. of Georgia, Athens (USA)). *Journal of the American Chemical Society;* **110**: No. 5, 1645-1646(2 Mar 1988). Contract AC04-76DP00789.

The S-methyl coenzyme M [CH_3-S-CoM, 2-(methylthio)ethanesulfonic acid] methylreductase enzyme of Methanobacterium thermoautotrophicum contains F_{430}, the nickel-tetrapyrrole cofactor which is thought to be the site of reduction of CH_3-S-CoM to methane and HS-CoM. Here the use of resonance Raman spectroscopy is reported for the investigation of the well-characterized forms of isolated F_{430} in aqueous solution and the intact methylreductase. The Raman spectra were obtained on pairs of 100-200 μM samples by using a split cell designed for a Raman difference spectrometer described previously. The spectra were excited at 441.6 nm with a 40 mW defocused, unpolarized beam of a helium-cadmium laser (Omnichrome) operating at 4-cm^{-1} resolution.

37146 **Intermediacy of paramagnetic metal-hydrocarbyl species in organometallic reactions. Detection and characterization of a novel paramagnetic iron(II)-benzyl compound in the coupling of benzyl halides.** Hill, D.H.; Sen, A. (Pennsylvania State Univ., University Park (USA)). *Journal of the American Chemical Society;* **110**: No. 5, 1650-1652(2 Mar 1988). Contract FG02-84ER13295.

Paramagnetic metal-hydrocarbyl species have been postulated as intermediates in several organometallic reaction sequences. In the preponderance of these reactions the paramagnetic intermediate has been detected by ESR spectroscopy. In other cases these species have been implicated by the observation of CIDNP as a result of the formation of an accompanying organic radical. Unfortunately, the more direct characterization of these intermediates by NMR spectroscopy based upon chemical shifts and resonance intensities has, thus far, been hindered by sever line broadening. Herein, the authors report the detection and characterization by NMR spectroscopy of a novel paramagnetic Fe(II)-benzyl compound $(TMEDA)Fe(CH_2Ph)_2$, which is the key intermediate in the cou-

pling of benzyl halides by [CpFe(COD)][Li-(TMEDA)], (Cp = $C_5H_5^-$, COD = 1,5-cyclooctadiene, TMEDA = $Me_2N(CH_2)_2NMe_2$).

37147 **Tantalum(I) alkyne complexes: $Ta(CO)_2(eta^2-RC{=}CR)(I)L_3$.** McGeary, M.J.; Gamble, A.S.; Templeton, J.L. (Univ. of North Carolina, Chapel Hill (USA)). *Organometallics;* 7: No. 2, 271-279(Feb 1988).

Excess alkyne reacts with $Ta(CO)_3(I)L_2$ to form $Ta(CO)_2(eta^2-RC{=}CR)(I)L_2$ complexes (L = PMe_3 and RCCR = PhCCPh (3), PhCCH (4), HCCH (5), $Ph_2PCCPPh_2$ (6); L = $P(OMe)_3$ and RCCR = PhCCPh (7)). These octahedral d^4 tantalum alkyne adducts have been characterized by ^1H, ^{13}C, and ^{31}P NMR, as well as by infrared and visible spectroscopy. Low-field acetylenic proton and carbon resonances are compatible with a four-electron donor alkyne description for these complexes. Variable-temperature ^{13}C NMR studies of ^{13}CO enriched $Ta(CO)_2(PhCCH)(I)(PMe_3)_2$ revealed a ΔGdouble dager of 16 kcal/mol for alkyne rotation about the C-C midpoint of the tantalum-alkyne axis. The X-ray crystal structure of $Ta(CO)_2(PhCCPh)(I)(PMe_3)_2$ has been determined. [Crystal data: monoclinic, $P2_1/c$; a = 12.304 (4) A, b = 30.971 (8) A, c = 13.967 (5) A; β = 96.91 (3)°; Z = 8.] The molecule adopts a distorted octahedral geometry with trans carbonyl ligands and trans PMe_3 ligands. The alkyne is trans to iodide to complete the coordination sphere, and the C-C axis is parallel to the OC-Ta-CO axis. Average metal-ligand bond distances for the two independent molecules in the unit cell are Ta-I, 2.88 (1) A; Ta-C (alkyne), 2.06 (6) A; and Ta-CO, 1.98 (9) A. There is a definite pyramidal distortion of the four equatorial ligands away from the alkyne ligand toward the trans iodide.

37148 **Comparison of the electronic structure of disubstituted ferrocenes.** Dowben, P.A.; Driscoll, D.C.; Tate, R.S.; Boag, N.M. (Syracuse Univ., NY (USA)). *Organometallics;* 7: No. 2, 305-308(Feb 1988). Contract FG02-87ER45319;W-7405-ENG-82.

The authors have measured the optical absorption of gaseous ferrocene, 1,1'-dimethylferrocene, 1,1'-dibromoferrocene, and 1,1'-dichloroferrocene using synchrotron radiation. From these data they have estimated the ligand field parameters and noted increasing e/sub 2g/(d) to Cp(π) overlap with increasing charge transfer from the Cp ring to the substitution.

37149 **Reaction of organoboranes with olefinic α,β-unsaturated nitro compounds.** Kabalka, G.W.; Gai, Y.Z.; Goudgaon, N.M.; Varma, R.S.; Gooch, E.E. (Univ. of Tennessee, Knoxville (USA)). *Organometallics;* 7: No. 2, 493-495(Feb 1988). Contract FG05-86ER60434.

The reaction of lithium triethylborohydride with nitroalkenes in the presence of borane results in the unexpected formation of N-ethylamine derivatives. Evidence supports a reaction sequence involving the 1,2-addition of triethylborane to a nitroso intermediate.

37150 **Dimethylsilanone ($Me_2Si{=}O$) generation by retroene decomposition of allyloxysilanes.** Barton, T.J.; Bain, S. (Iowa State Univ., Ames (USA)). *Organometallics;* 7: No. 2, 528-531(Feb 1988).

Gas-phase thermolysis of (allyloxy)dimethylsilane cleanly affords dimethylsilanone by retroene decomposition (log A = 12.6, E/sub a/ = 54.6 kcalmol). However, substituting the ether-linked carbon with two methyl groups (3-(dimethylsiloxy)-3-methyl-1-butene) introduces a competition between C-O bond homolysis and retroene decomposition.

37151 **Band electronic structure study of the semimetallic properties and the anisotropic resistivity hump in $ZrTe_3$.** Canadell, E.; Mathey, Y.; Whangbo, M.H. (Universite de Paris-Sud, Orsay (France)). *Journal of the American Chemical Society;* 110: No. 1, 104-108(6 Jan 1988). Contract FG05-86ER45259.

Tight-banding calculations were carried out on $ZrTe_3$ to examine its semimetallic properties and anisotropic resistivity hump at ~ 63K. The authors calculations show that adoption of the type B structure is crucial for the semimetallic nature of $ZrTe_3$. The overlapping of the Te 5p-block bands with the Zr 4d-block bands gives rise to a pair of nested electron pockets and a pair of nested hole pockets, all of which have the shape of a flat cylinder whose axis is perpendicular to the chain direction. Thus, a charge density wave formation associated with the Fermi surface nesting does not affect the electrical conductivity of $ZrTe_3$ along the chain direction, so that the resistivity hump is observed only along the directions perpendicular to the chain axis.

37152 **Calculation of the thermodynamic and transport properties of aqueous species at high pressures and temperatures: dissociation constants for supercritical alkali metal halides at temperatures from 400 to 800°C and pressures from 500 to 4000 bar.** Oelkers, E.H.; Helgeson, H.C. (Univ. of California, Berkeley (USA)). *Journal of Physical Chemistry;* 92: No. 6, 1631-1639(1988). Contract AS03-83ER13100;FG03-85ER13419.

Dissociation constants from 400 to 800°C at 500-4000 bar have been calculated for 14 aqueous alkali metal halides from experimental conductance measurements reported by Quist and Marshall using the Shedlovsky equation and the law of mass action, together with independently calculated limiting equivalent conductances for the electrolytes generated from equations given by Oelkers and Helgeson. The requisite activity coefficients were calculated for neutral and charged species from the Setchenow and extended Debye-Hueckel equations, respectively. Where direct comparison can be made, dissociation constants reported by Quist and Marshall and Dunn and Marshall fall within estimated uncertainties of corresponding values generated in the present study. The logarithms of the calculated dissociation constants range from ~ -0.7 at low temperatures and high pressures to ~ -4.5 at high temperatures and low pressures.

37153 **Double-quantum filter for rotating solids.** Meier, B.H.; Earl, W.L. (Los Alamos National Lab., NM (USA)). *Journal of the American Chemical Society;* 109: No. 26, 7937-7942(23 Dec 1987).

A pulse sequence is demonstrated which effectively excites double-quantum coherences in solid samples rotating at the magic angle. A double-quantum filter using this sequence is presented and applied to ^{13}C-labeled zinc acetate to demonstrate its effectiveness. The ^{13}C-^{13}C scalar coupling between the methyl and carboxyl resonances was observed as well as a shift of 31 Hz in the center of both resonances arising from the homonuclear dipole Hamiltonian. It was also noted that when the spinning sideband patterns of the two coupled resonances overlap, carbon flip-flop transitions are facilitated, resulting in significant broadening of the spectral lines.

37154 **Effects of ion aggregation on the intervalence transfer band of the mixed-valence biferrocenium cation in solution.** Lowery, M.D.; Hammack, W.S.; Drickamer, H.G.; Hendrickson, D.N. (Univ. of Illinois, Urbana (USA)). *Journal of the American Chemical Society;* 109: No. 26, 8019-8024(23 Dec 1987). Contract AC02-76ER01198.

The concentration dependence of the energy (E/sup op/) of the intervalence transfer (IT) electronic absorption band of mixed-valence biferrocenium triiodide dissolved in either nitrobenzene or dichloromethane is examined. In nitrobenzene, E/sup op/ increases rapidly from ~ 5.57 to ~ 6.05 x 10^3 cm^{-1} in the 0.24-0.4 mM range, whereupon further increases in the concentration of biferrocenium triiodide lead to E/sup op/ increasing more gradually to a value ~ 6.3 x 10^3 cm^{-1} at 24 mM. On the other hand, the full width at half maximum (Δ anti $v_1 2$) and the transition moment of the IT band decrease with increasing concentration for biferrocenium triiodide in nitrobenzene. E/sup op/ increases, Δ anti $v_1 2$ remains constant, and the transition moment of the IT band increases with increasing concentration for biferrocenium triiodide in dichloromethane in the more limited range of 0.30-0.95 mM. These concentration dependencies of the IT band for biferrocenium triiodide are attributable to variable degrees of ion aggregation in solution. The concentration dependencies of the electrical conductivity of solutions of biferrocenium triiodide in either nitrobenzene or dichloromethane substantiate this proposal. IT band contours obtained at different concentrations are fit to the PKS vibronic model to

yield parameters that characterize the electronic and vibronic coupling within the mixed-valence biferrocenium cation.

37155 **Selective catalytic dehydrogenation of alkanes to alkenes.** Burk, M.J.; Crabtree, R.H. (Yale Univ., New Haven, CT (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 8025-8032(23 Dec 1987).

Linear and cyclic alkanes can be selectively dehydrogenated to the corresponding alkenes both thermally and photochemically (254 nm) with iridium complexes as catalysts. In the photochemical case, a sacrificial hydrogen acceptor is not required and H_2 is evolved directly. Preferential initial formation of the least stable alkene (e.g., methylenecyclohexane from methylcyclohexane) is explained by attack at unhindered C-H bonds by an oxidative addition to the metal. A subsequent β-elimination gives the alkene. A key feature of the catalyst, $[IrH_2(eta^3\text{-}O_2CCF_3)(PR_3)_2]$ (4), is that the chelating acetate group can open up to allow β-elimination to take place in the alkyl hydride intermediate $[IrH(R)(eta^2\text{-}O_2CCF_3)(PR_3)_2]$. Prolonged reaction times lead to progressive isomerization of the alkene to give the thermodynamic product (e.g., 1-methylcyclohexene from methylcyclohexane). Up to 32 turnovers of dehydrogenation are seen. Deactivation of the catalyst takes place by P-C hydrogenolysis of the PAr_3 ligand in the thermal case; the rise in the amount of ArH formed parallels the fall-off in activity of the catalyst. P-C cleavage does not take place in the photochemical system (R = cyclohexyl).

37156 **Proton transfer from metal hydrides to metal alkynyl complexes. Remarkable carbon basicity of $(C_5H_5)(PMe_3)_2Ru\text{--}C{\equiv}C\text{-}CMe_3$.** Bullock, R.M. (Brookhaven National Lab., Upton, NY (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 8087-8089(23 Dec 1987). Contract AC02-76CH00016.

The reactions of transition-metal hydrides with metal alkynyl compounds are virtually unexplored. The only previous systematic study is Lukehart's synthesis of bridging vinylidene complexes from formal addition of a Pt-H bond across the carbon-carbon triple bond of several metal alkynyl compounds. Davison and Selegue have shown that unsaturated carbon ligands bonded to late transition metals generally undergo β-attack by electrophiles and α-attack by nucleophiles. This suggested that metal vinylidene complexes might be formed by proton transfer from metal hydrides to metal alkynyl complexes. This communication reports the first kinetic and thermodynamic measurements on this type of reaction and provides evidence that certain ruthenium alkynyl complexes are remarkably strong carbon-centered bases.

37157 **Divalent titanium chemistry. Synthesis, reactivity, and x-ray and neutron diffraction studies of $Ti(BH_4)_2(dmpe)_2$ and $Ti(CH_3)_2(dmpe)_2$.** Jensen, J.A.; Wilson, S.R.; Schultz, A.J.; Girolami, G.S. (Univ. of Illinois, Urbana (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 8094-8096(23 Dec 1987). Contract W-31-109-ENG-38.

Low valent organotitanium complexes have been implicated as Ziegler-Natta olefin polymerization catalysts and as stoichiometric reagents in organic synthesis. However, very few low-valent alkyls of titanium have been reported, and, in particular, the divalent oxidation state of titanium is virtually unexplored. The authors now report the synthesis and characterization of the unusual divalent tetrahydroborate complex $Ti(BH_4)_2(dmpe)_2$, 1, and its conversion to the methyl compound $Ti(CH_3)_2(dmpe)_2$, 2. Complex 2 is unique among octahedral complexes of the 3d metals in being low-spin within the t/sub 2g/ manifold and exhibits very unusual NMR features for the titanium methyl group.

37158 **Insertion of carbon monoxide into transition-metal-acyl bonds to form α-ketoacyl complexes.** Sheridan, J.B.; Han, S.; Geoffroy, G.L. (Pennsylvania State Univ., University Park (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 8097-8098(23 Dec 1987).

Migratory insertion of CO into transition-metal-alkyl bonds to form acyl ligands is one of the most studied of all transition-metal organometallic reactions. In contrast, the insertion of a second CO into a metal-acyl bond to form an α-ketoacyl ligand has never been observed, even though a number of important double carbonylation reactions could involve such a transformation. However, the only mechanistically studied double carbonylation catalyst has been shown to form α-ketoamide products not by CO insertion into a metal-acyl bond but by reductive-coupling of two acyl ligands. Indeed, all previous studies have led to the general conclusion that insertion of CO into a metal-acyl bond is not a likely reaction. They have now discovered methodology that allows this chemistry to be accomplished by a novel oxidation/NO addition reaction sequence. Reported herein are the first examples of the formal insertion of CO into metal-acyl bonds to form α-ketoacyl ligands.

37159 **H_3O^+ cation in aromatic solvent. Synthesis, structure, and solution behavior of $[H_3O^+ \times 18\text{-crown-}6][Cl\text{-}H\text{-}Cl]$.** Atwood, J.L.; Bott, S.G.; Coleman, A.W.; Robinson, K.D.; Whetstone, S.B.; Means, C.M. (Univ. of Alabama, Tuscaloosa (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 8100-8101(23 Dec 1987).

The interaction of the oxonium ion, H_3O^+, with polar solvents has been extensively reviewed in the broader context of hydrogen bonding. The first report of a complex of H_3O^+ and a macrocycle was an infrared spectroscopic study in 1972. More recently several reports have appeared. This has proved to be a method of isolation of H_3O^+ from higher hydrated species, H_3O^+ coordinated to macrocycles have been reported, one which lends strong support for pyramidal H_3O^+, and one which may be interpreted in terms of planar H_3O^+. In the extensive literature of the oxonium ion, evidence for the species in aromatic solution has not bee presented. Here the authors report that the oxonium ion coordinated to 18-crown-6 does indeed have a stable existence in aromatic media.

37160 **Carbon-hydrogen bond activation by electrophilic transition-metal compounds. Palladium(II)-mediated oxidation of arenes and alkanes including methane.** Gretz, E.; Oliver, T.F.; Sen, A. (Pennsylvania State Univ., University Park (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 8109-8111(23 Dec 1987). Contract FG02-84ER13295.

The activation of carbon-hydrogen bonds by transition metals that leads to the selective functionalization of hydrocarbons, especially alkanes, is one of the most challenging problems in organometallic chemistry. Herein, the authors report on the palladium(II)-mediated oxidation of arenes and alkanes through a nonradical, electrophilic C-H activation pathway.

37161 **Molecular hydrogen complexes. 5. Electronic control of $eta^2\text{-}H_2$ versus dihydride coordination. Dihydride structure of $MoH_2(CO)(R_2PC_2H_4PR_2)_2$ for R = Et, i-Bu versus $eta^2\text{-}H_2$ for R = Ph.** Kubas, G.J.; Ryan, R.R.; Unkefer, C.J. (Los Alamos National Lab., NM (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 8113-8115(23 Dec 1987).

Since their discovery, new examples of transition-metal molecular-hydrogen (M-$eta^2\text{-}H_2$) complexes have been established at an increasingly rapid pace, including several complexes previously formulated as classical hydrides (e.g., $FeH_4(PEtPh_2)_3$). Equilibrium between dihydrogen and dihydride ligands has been observed in solution, /sup 2a,2d/ emphasizing that $eta^2\text{-}H_2$ complexes can be considered tautomers of hydrides and not merely arrested intermediates in hydride formation. Much remains to be learned about these complexes which represent the first examples of coordination of a σ bond to a metal. In particular, the electronic (e.g., ligand basicity) and steric (ligand bulk) factors which stabilize H_2 binding are not yet completely understood. The authors report here the preparation of a series of complexes in which the fate of hydrogen addition ($eta^2\text{-}H_2$ versus dihydride binding) rests primarily upon the basicity of the metal center as dictated by the electron-donating ability of ancillary phosphine ligands.

37162 Crystal structures of $[Au(DDDT)_2]^0$ and $[(n\text{-}Bu)_4N][Ni(DDDT)_2]$ and the ligandlike character of the isoelectronic radicals $[Au(DDDT)_2]^0$ and $[Ni(DDDT)_2]^-$. Schultz, A.J.; Wang, H.H.; Soderholm, L.C.; Sifter, T.L.; Williams, J.M.; Bechgaard, K.; Whangbo, M.H. (Argonne National Lab., IL (USA)). *Inorganic Chemistry;* **26**: No. 22, 3757-3761(4 Nov 1987). Contract W-31-109-ENG-38;FG05-86ER45259.

Use of the dithiolene ligand 5,6-dihydro-1,4-dithiin-2,3-dithiolate (DDDT) led to the new gold complex $[Au(DDDT)_2]^0$. A single-crystal x-ray diffraction study shows that the crystal of $[Au(DDDT)_2]^0$ molecules packs in a dimerlike motif as found for the crystal of neutral bis(ethylenedithio)-tetrathiafulvalene (ET) molecules. In terms of valence electrons, $[Au(DDDT)_2]^0$ and $[Ni(DDDT)_2]^-$ molecules are isoelectronic. The present molecular orbital calculations suggest that the metal ions of both molecules are best described as d^8 ions as expected for square-planar metal complexes, and so an unpaired electron in each molecule resides largely on the DDDT ligands with a small delocalization into the metal ion. The crystal of $[Au(DDDT)_2]^0$ molecules shows no ESR absorption, which is likely due to the dimerlike packing motif and can be regarded as a consequence of a strong spin-Peierls distortion. The synthesis, single-crystal x-ray structure, and magnetic susceptibility of $[(n\text{-}Bu)_4N][Ni(DDDT)_2]$ are also reported. In this salt, $[Ni(DDDT)_2]^-$ molecules are found to form stacks, in contrast to those in $[Et_4N][Ni(DDDT)_2]$, which form layers. Unit cell parameters for $[Au(DDDT)_2]^0$ are space group $P2_1/n$, a = 6.496 (1) A, b = 13.267 (4) A, c = 16.775 (3) A, β = 94.87 (2)°, V = 1440.5 (5) A^3, and Z = 4. For $[(n\text{-}Bu)_4N][Ni(DDDT)_2]$, the space group is P anti 1, a = 9.126 (6) A, b = 13.519 (9) A, c = 13,723 (5) A, α = 86.31 (4)°, β = 89.59 (4)°, γ = 77.58 (5)°, V = 1650 (2) A (2) A^3, and Z = 2. 11 references, 6 figures, 6 tables.

37163 Iron-57 Moessbauer spectra of $MnFeF_5$ x $2H_2O$. Karraker, D.G. (E. I. du Pont de Nemours and Company, Aiken, SC (USA)). *Inorganic Chemistry;* **26**: No. 22, 3814-3816(4 Nov 1987). Contract AC09-76SR00001.

Results of a recently reported low-temperature magnetic susceptibility study of $MnFeF_5$ x $2H_2O$ showed a transition to ferromagnetic ordering at 38 +- 0.25K. These magnetic studies have now been extended by Moessbauer spectroscopy to the temperature range 4.2 - 53K. The Moessbauer parameters for $MnFeF_5$ x $2H_2O$ did not show the transition below the critical temperature, T/sub c/, reported by other workers for Fe_2F_5 x $2H_2O$; however, the quadrupole-splitting constant in the paramagnetic region of the spectrum was essentially the same as that previously reported for Fe^{2+} in Fe_2F_5 x $2H_2O$. The magnetic properties of Fe^{2+} in $MnFeF_5$ x $2H_2O$ are very similar to those of Fe^{2+} in Fe_2F_5 x $2H_2O$. 11 references, 4 figures, 1 table.

37164 Halide-promoted formation and carbonylation of μ_3-nitrene ligands on Ru_3 clusters. Han, S.H.; Geoffroy, G.L.; Rheingold, A.L. (Pennsylvania State Univ., University Park (USA)). *Inorganic Chemistry;* **26**: No. 21, 3426-3428(21 Oct 1987).

Results of work reported herein show that halides dramatically promote nitrene carbonylation to form isocyanates. Halides have also been found to accelerate the formation of nitrene ligands from nitrobenzene. Reasons for the halide promotion are unknown; however, it is suggested that the halides facilitate the reaction by labilizing the Ru-N bond to form a dibridging nitrene that then undergoes nucleophilic attack on a coordinated carbonyl. 16 references, 1 figure.

37165 Structure of $MnPO_4$ x H_2O by synchrotron x-ray powder diffraction. Lightfoot, P.; Cheetham, A.K.; Sleight, A.W. (Univ. of Oxford (England)). *Inorganic Chemistry;* **26**: No. 21, 3544-3547(21 Oct 1987).

The crystal structure of $MnPO_4$ x H_2O has been determined from high-resolution synchrotron X-ray powder diffraction data. The powder pattern was indexed on the basis of 20 accurately measured reflections by an automatic indexing program. Integrated intensities were obtained for 61 unambiguously indexed reflections and used to generate a Patterson map from which the position of the manganese atom was determined. The remaining non-hydrogen atoms were located by Fourier methods, and the hydrogen atom was placed geometrically and refined without constraints. Refinement of the entire diffraction profile, by the Rietveld method, converged to final agreement factors R/sub wp/ = 0.161, R/sub p/ = 0.122, and R/sub I/ = 0.047. The compound crystallizes in the monoclinic space group, C2c, with lattice parameters a = 6.912 (1) A, b = 7.470 (1) A, c = 7.357 (1) A, β = 112.3 (1)°, and Z = 4. The structure consists of axially distorted MnO_6 octahedra linked together, through the oxygen atom of the water molecule at a common vertex, to form zigzag-Mn-O-Mn-chains running parallel to [101]. These chains are interconnected by PO_4 tetrahedra to form a continuous three-dimensional network. 27 references, 5 figures, 2 tables.

37166 Characterization of hydrogen adsorption on palladium and Pd/C using a radiotracer. Loh, K.; Tang, Y. (Industrial Technology Research Institute, Hsinchu (Taiwan)). *Journal of the Chinese Chemical Society (Taipei);* **34**: No. 3, 231-235(Sep 1987).

Hydrogen adsorption on palladium black and palladium supported on activated carbon was characterized by the Temperature Programmed Desorption technique (TPD) using the radiotracer tritium. It is shown that there are five energetic desorbed hydrogens with peak maxima at -50, 35, 115, 350, and 580°C. An additional peak at -120°C hydrogen desorbed from activated carbon was observed on Pd/C. An isotopic hydrogen separation experiment was designed to demonstrate that hydrogen only dissociatively adsorbed on palladium surfaces whereas it was associatively adsorbed on activated carbon.

37167 (DOE/ER/13387—37) Organic redox phototransformations at chemically-modified surfaces: Progress report. (Texas Univ., Austin (USA). Dept. of Chemistry). 1988. Contract FG05-85ER13387. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008650/JAW.

Work has continued on the mechanistic characterization of new chemical transformations of organic molecules at native and chemically-modified surfaces. New electrodes are being prepared by adsorption, covalent attachment, polymerization, mulling and sputtering with electroactive and light sensitive materials. Photocatalytic oxidation of organic substrates occurs with high chemical yield on irradiated semiconductor surfaces. Photocatalysis has been defined for several functional groups.

37168 (DOE/ER/13387—37A) Organic redox phototransformations at chemically modified surfaces: Progress report, August 1985-January 1988. Fox, M.A. (Texas Univ., Austin (USA). Dept. of Chemistry). 1 Feb 1988. Contract FG05-85ER13387. 14p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008649/JAW.

This research program has involved mechanistic studies of new chemical transformations of organic molecules at native and chemically modified surfaces. New electrode materials have been prepared by adsorption, covalent attachment, polymerization, and mulling with electroactive and with light-sensitive materials. Physical characterization of these designed surfaces have been studied by rapid kinetic methods. Catalytic organic reactions initiated by electron exchange on these three-dimensional arrays have been sought, and mechanistic studies of prime candidiates for efficient electrocatalysis. 9 figs.

37169 (SAND—87-2082C;J) The kinetics of charge-transfer reactions on passive lithium electrodes. Delnick, F.M. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 19p. (CONF-880598—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009256/JAW.

From 4. international meeting on lithium batteries; Vancouver, Canada (23 May 1988).

Lithium anodes are covered by LiCl passive films in $SOCl_2$ solutions. At open-circuit, film growth is controlled by electronic

processes within the film. Under discharge, solid-state ionic processes control the kinetic behavior of the electrode. These processes are not independent of one another. In this report, the interaction of electronic and ionic processes in LiCl passive films is reviewed. Special attention is directed to the role of lattice imperfections in establishing and controlling the mechanisms of electronic and ionic charge transport. 17 refs.

37170 **Interfacial electron-transfer reactions between platinum colloids and reducing radicals in aqueous solution.** Harriman, A.; Millward, G.R.; Neta, P.; Richoux, M.C.; Thomas, J.M. (Royal Institution, London (England)). *Journal of Physical Chemistry;* **92**: No. 5, 1286-1290(10 Mar 1988).

Cyclic voltammetry has been used to evaluate redox potentials, diffusion coefficients, and heterogeneous electrochemical rate constants for reducing radicals derived from various N-methylbipyridinium ions, N-methylpyridinium ions, aryl ketones, and p-nitrobenzoate ion in aqueous solution. The absorption spectra, rates of formation, and stabilities of these radicals have been determined by pulse radiolytic techniques. All the above radicals transfer an electron to colloidal Pt particles (characterized by high-resolution electron microscopy), and the bimolecular rate constants for such interfacial reactions have been measured under pulser radiolytic conditions. The magnitude of these rate constants is found to depend upon a number of factors related to both mass-transfer and surface processes.

37171 **Technetium electrochemistry. 5. Spectroelectrochemical studies on the hexachlorotechnetate(IV) and hexabromotechnetate(IV) complexes in aqueous media.** Huber, E.W.; Heineman, W.R.; Deutsch, E. (Univ. of Cincinnati, OH (USA)). *Inorganic Chemistry;* **26**: No. 22, 3718-3722(4 Nov 1987). Contract AC02-80EV10380.

Thin-layer spectroelectrochemical techniques have been employed to show that the TcX_6^{2-} (X = Cl, Br) complexes undergo a reversible one-electron reduction in concentrated HX/NaX aqueous media (typically, 2.0 M HX and 3.0 M NaX). A single 4-min Tc(IV) → Tc(III) → Tc(IV) cycle in the thin-layer cell generates a completely equilibrated $TcX_6^{2-}/TcX_5(H_2O)^-$ Tc(IV) system, even though these substitution-inert Tc(IV) complexes normally require several days to reach equilibrium at room temperature. Spectropotentiostatic experiments conducted as a function of $[H^+]$ and $[H^-]$ show that the bromo system is 160 mV easier to reduce than is the chloro system and that both hydrogen and halide ions are lost from the Tc center upon reduction from Tc(IV) to Tc(III). The numbers of H^+ ions lost from the chloro and bromo systems are 1.2 +/- 0.1 and 1.6 +/- 0.3, respectively; the number of chloride ligands lost is 2.7 +/- 0.1, while the number of bromide ligands lost is 5.9 +/- 0.5. A general reaction scheme consistent with these results is presented, and implications are drawn about the relatively high lability and low halide affinity of the Tc(III) center in aqueous media. 28 references, 6 figures, 1 table.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

We have studied the single and double nonresonant multiphoton ionization of calcium atom using both 532-nm and 1.06μm radiation. These studies were conducted in the intensity regime of 10^{10-13} Wcm^2. We use mass and angularly resolved electron energy analysis in an attempt to gain insight into the dominant mechanisms responsible for ionization. 3 figs., 1 tab.

37173 **(DOE/ER—13633-2) Energy conversion processes based on molecular excited states: Progress report, August 1, 1987-July 31, 1988.** Meyer, T.J. (North Carolina Univ., Chapel Hill (USA)). Mar 1988. Contract FG05-86ER13633. 6p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008126/JAW.

The first of the two interwoven threads of our DOE-supported research efforts include studies on the preparation and photochemical properties of transition metal complexes which have metal to ligand charge transfer excited states. In sight is being gained into the electronic structure and photochemical and photophysical properties of these excited states. The second emphasis in our work has been on the preparation and characterization of thin polymeric films which contain these complexes. The goal is to learn how to vary the underlying microstructure as a basis for energy conversion applications at the molecular level. 10 refs.

37174 **(DOE/ER—60552-1) Chemical interactions of polycyclic organic compounds with coal fly ash and related solid surfaces: Progress report, July 1, 1987-June 30, 1988.** Mamantov, G.; Wehry, E.L. (Tennessee Univ., Knoxville (USA). Dept. of Chemistry). Jan 1988. 7p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008125/JAW.

The principal objective is to characterize the interactions of polycyclic aromatic hydrocarbons (PAHs) and their derivatives with the surfaces of coal ash particles (and those of other atmospheric particulate solids), with particualr emphasis on the photochemical degradation of adsorbed PAHs. We deposit PAHs from the vapor phase onto the surfaces of particulate solid in order to mimic, as closely as possible under laboratory conditions, the process whereby PAHs generated in the vapor phase by combustion sources subsequently deposit onto atmospheric particulate matter. Previous investigations have shown that coal ash surfaces stabilize PAHs to photodecomposition. These coal ashes highest in carbon and/or iron content tend to be most effective in stablizing PAHs to phototransformation. Such observations imply that PAHs present as adsorbates on particulate surfaces have significantly greater atmospheric residence times than had previously been assumed. 18 refs.

37175 (RISO-M—2630, pp 117-127) **Oxidant formation in the photolysis of the NO_3^- ion in aqueous solutions.** Herrmann, H.; Karthaeuser, J.; Zellner, R. (Institut fuer Physikalische Chemie, Universitaet Goettingen (DE)). Jan 1988. NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752926/JAW. (CONF-8709266—).

From 6. workshop of the working party 2 "chemical and photochemical reactions" of the concerted action "physico-chemical behaviour of atmospheric pollutants"; Roskilde, Denmark (17 Sep 1987).

37176 **Photodissociation study of 1,3-butadiene.** Sellers-Hann, L.; Krailler, R.E.; Russell, D.H. (Department of Chemistry, Texas A&M University, College Station, Texas 77843). *Journal of Chemical Physics;* **89**: No. 2, 889-896(15 Jul 1988).

Laser-ion beam photodissociation is used to study the $C_4H^+_6$ radical cation formed by electron impact (70 eV nominal energy) ionization of 1,3-butadiene. The kinetic energy release value obtained from $C_4H^+_6 \rightarrow C_3H^+_3 + CH_3$ does not agree with the distribution reported by Farrar [J. Chem. Phys. 77, 263 (1982)]. The photodissociation studies of $C_4H^+_6$ suggest the existence of a long-lived ($>0.05 \times 10^{-6}$ s) photoexcited $C_4H^+_6$ ion. Also, results of photodissociation studies of $C_4H^+_6$ trapped in the electron beam space charge are consistent with the proposed long-lived photoexcited $C_4H^+_6$ ion. Therefore, it is proposed that the two-photon photodissociation of $C_4H^+_6$ reported by Baer [J. Chem. Phys. 85, 6361 (1986)] is a sequential two-step process involving a long-lived excited $C_4H^+_6$ ion.

37177 **Reaction paths for the dissociation a-italic-tilde $^3A''$ $CH_2CO \rightarrow X\ ^3B_1\ CH_2 + X\ ^1\Sigma^+\ CO$.** Allen, W.D.; Schaefer H.F. III. (Combustion Research Facility, Sandia National Laboratories, Livermore, California 94550, and Department of Chemistry and Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Chemical Physics;* 89: No. 1, 329-344(1 Jul 1988).

An ab initio investigation of the (C/sup II//sub s/) in-plane bent $^3A''$ $CH_2CO \rightarrow X\ ^3B_1\ CH_2 + X$ ^{1}summation$^+$ CO and the (C/sup I//sub s/) out-of-plane bent $^3A'$ $CH_2CO \rightarrow X\ ^3B_1\ CH_2 + X$ ^{1}summation$^+$ CO dissociation paths has been performed. Geometrical structures, vibrational frequencies, and quadratic force constants have been determined at the DZP SCF and DZP CISD levels of theory for the X $^1A_1$, $^3A''$, and $^3A'$ states of ketene and for the $^3A''$ and $^3A'$ transition states for dissociation. The DZP CISD structure for A-italic-tilde $^1A''$ ketene is also reported. Final energetic predictions for triplet ketene dissociation have been obtained from large-basis (QZ2P and QZ2P+f) UMP4(SDTQ) calculations at the DZP CISD geometries. The C/sup II//sub s/ stationary point for $^3A''$ ketene dissociation is a true transition state with r(C—C) = 2.071 A at the DZP CISD level of theory. The corresponding C/sup I//sub s/ stationary point for $^3A'$ ketene is actually a super transition state for the interconversion of two equivalent $^3A''$C/sup II//sub s/ transition states for dissociation.

37178 **Dimethylsilylene: spectroscopy, reactivity, and complexation in fluid solutions.** Levin, G.; Das, P.K.; Lee, C.L. (Dow Corning Corp., Midland, MI (USA)). *Organometallics;* 7: No. 5, 1231-1232(May 1988).

Upon 266-nm laser flash photolysis, cyclohexane solutions of dodecamethylcyclohexasilane give rise to a transient species (λ/sub max/ = 465 nm) that is best assigned as dimethylsilylene. This species exhibits unusually high reactivity toward alcohols and reagents containing Si-H, C=C, and C identical with C bonds (with rate constants in the limit of diffusion control) and readily forms complexes with lone-pair containing molecules (ethers, triethylamine, and acetonitrile), the latter showing considerably reduced reactivity relative to the free silylene.

37179 **Scintillation process in three-component systems: mechanism of the luminescence minimum.** Yoshida, Y.; Lipsky, S. (Univ. of Minnesota, Minneapolis (USA)). *Journal of Physical Chemistry;* 92: No. 8, 2240-2248(21 Apr 1988).

Three-component systems consisting of a saturated hydrocarbon solvent, C, an aromatic solvent, B, and a fluorescent solute, T, are excited either optically (in the absorption band of C and below its ionization potential) or with 0.67-MeV β^- particles. The luminescence of T is detected and studied as a function of the B/C concentration ratio. Systems studied are C = cyclohexane, trans-decalin, methylcyclohexane, bicyclohexyl, n-heptane, or 2,3-dimethylbutane; B - benzene or toluene; and T = N,N,N',N'-tetramethylphenylenediamine (TMPD), p-terphenyl, or 2,5-diphenyloxazole (PPO). The luminescence behavior is observed under both aerated and nitrogenated conditions. For B = benzene, the luminescence of T is depressed by the replacement of C with B, at low B/C concentration ratios. This occurs for both modes of excitation for all C except bicyclohexyl and 2,3-dimethylbutane. At higher B/C concentration ratios, the luminescence of T recovers and ultimately exceeds its intensity in pure C + T. Thus there is observed a luminescence minimum. At low T concentrations the position and depth of the minimum are very sensitive to the presence of O_2, but at higher concentrations this sensitivity is lost. For B = toluene, the luminescence minimum is only observed under β^- particle excitation conditions. A mechanism is developed to accommodate these observations. Its analysis indicates that production of S_1 states of B (i.e., B*) via either energy transfer from C* or via charge transfer from C^+ followed by the geminate recombination $B^+ + e^- \rightarrow B^*$ is intrinsically inefficient in dilute cyclohexane solutions. For B = benzene this inefficiency resides mainly in the electronic energy transfer process and for toluene in the ion-recombination process. Also, the analysis indicates that there must be two states of C that can transfer energy to B and/or T.

37180 **Photoelectrochemistry in particulate systems. 7. Electron-transfer reactions of indium sulfide semiconductor colloids.** Kamat, P.V.; Dimitrijevic, N.M.; Fessenden, R.W. (Univ. of Notre Dame, Indiana (USA)). *Journal of Physical Chemistry;* 92: No. 8, 2324-2329(21 Apr 1988).

Small semiconductor colloids of In_2S_3 have been prepared in aqueous and nonaqueous media and their absorption properties characterized. A transient photobleaching and formation of S/sup .-/ and S_2H_3/sup .-/ radicals have been observed upon laser pulse (355 nm) excitation of these colloids. With the aid of transient absorption spectra, the anodic corrosion process in these semiconductor colloids has been elucidated by using laser flash photolysis and pulse radiolysis techniques. With the use of a zwitterionic viologen compound, the interfacial charge-transfer process at the semiconductor surface has been studied. The quantum yield for the reduction of zwitterionic viologen was 0.07, which is similar to the value obtained with other metal chalcogenide semiconductor colloids. The microenvironment of the stabilizer (Nafion) influenced the charge-transfer process between the semiconductor and the redox decay.

37181 **Intramolecular excited-state electron transfer in a covalently linked porphyrin-viologen molecule: direct observation of the charge-separated intermediate by resonance Raman spectroscopy.** McMahon, R.J.; Force, R.K.; Patterson, H.H.; Wrighton, M.S. (Massachusetts Institute of Technology, Cambridge (USA)). *Journal of the American Chemical Society;* 110: No. 8, 2670-2672(13 Apr 1988).

The authors wish to report the observation of intramolecular excited-state electron transfer in porphyrin-viologen 1 by resonance Raman (RR) spectroscopy. The literature contains numerous examples of photochemical studies of porphyrins covalently linked to various electron acceptor units. Other workers have investigated long-range excited-state electron transfer in rigid model systems. In many instances, electron-transfer quenching of the porphyrin excited state has been inferred from fluorescence quenching experiments or lifetime measurements. Both fluorescence quenching and shortened lifetimes may result from processes other than electron transfer, however. Direct evidence for excited-state electron transfer requires techniques such as absorption spectroscopy or ESR spectroscopy. For example, in a series of porphyrin-viologen molecules related to 1 it was found that fluorescence quenching does occur, but the data were inconclusive with respect to whether the quenching results in electron transfer to the viologen center. They now describe a study in which they correlate the typical fluorescence and lifetime because the reduced viologen, Bz_2V/sup .+/ is easily detected by RR spectroscopy. Importantly, the porphyrin-viologen system appears to yield relatively long-lived charge-separated species following photoexcitation.

37182 **Effects of molecular organization on photophysical behavior. Time-resolved fluorescence of a pyrene-labeled phosphatidylcholine in spread monolayers of dioleoylphosphatidylcholine.** Bohorquez, M.; Patterson, L.K. (Univ. of Notre Dame, IN (USA)). *Journal of Physical Chemistry;* 92: No. 7, 1835-1839(7 Apr 1988).

The time-resolved behavior of 1-(6-pyreneylhexanoyl)-2-palmitoyl-sn-glycero-3-phosphocholine (1-PyPC) has been examined in spread of monolayers of dioleoylphosphatidylcholine (DOL) at the N_2-water interface as functions of concentration of 1-PyPC and of surface pressure within the layer. Both excited monomer emission at 380 nm and excimer emission at 480 nm were monitored after excitation by a 80-ps pulse at 354 nm. It was found that for first-order processes the rate constants are comparable to those reported for pyrene in cyclohexane. Rate constants for the diffusion-controlled excimer formation exhibit a small but definite dependence on surface pressure and may be used to obtain diffusion coefficients of the probe of (5-7) x 10^{-7} cm^2/s.

37183 **Dynamics of the $(^3CT)Ru(bpy)^{2+}$ relaxation and electron-transfer processes under intense magnetic fields: evidence about the formation of adducts in the MV^{2+} quenching of $(^3CT)Ru(bpy)_3^{2+}$.** Ferraudi, G.; Argueello, G.A. (Univ. of Notre Dame, IN (USA)). *Journal of Physical Chemistry;* 92: No. 7, 1846-1850(7 Apr 1988).

Intense magnetic fields (1-5 T) accelerate the rate of relaxation of $(^3CT)Ru(bpy)_3^{2+}$. The change of the rate constant with field intensity is linear for fields less intense than 4 T, a behavior inconsistent with an interaction mixing precursor and successor states. The rate constants of electron-transfer quenching of the excited state by $Co(NH_3)_5Cl^{2+}$, $Co(C_2O_4)_3^{3-}$ experience also field-induced changes which can be associated with variations in the value of the electronic coupling matrix element. The quenching by methylviologen, investigated by flash photolysis, has shown the presence of an intermediate in a microsecond time domain, and the quenching rate constant experienced a significant magnetic-field-induced deceleration.

37184 **Kinetics for electron transfer from laser-pulse-irradiated colloidal semiconductors to adsorbed methylviologen. Dependence on the quantum yield on incident pulse width.** Nosaka, Y.; Fox, M.A. (Technological Univ. of Nagaoka (Japan)). *Journal of Physical Chemistry;* **92**: No. 7, 1893-1897(7 Apr 1988).

The dependence of the quantum yield for reduction of adsorbed methylviologen Phi on the pulse width Δt and intensity of the incident laser pulse was measured on colloidal CdS stabilized with poly(acrylic acid) and on colloidal TiO_2 stabilized with poly)vinyl alcohol). The relationship among Phi, Δt, the laser intensity, and the rate constants for electron transfer (k/sub e/), hole decay (k/sub h/), and electron-hole recombination (k/sub r/) was deduced from a quantitative reaction kinetics model. On colloidal TiO_2, differences in Phi were observed for 30-ps and 10-ns incident pulses, requiring that k/sub e/ $> 10^{10}$ s^{-1}, k/sub h/ $> 10^{10}$ s^{-1}, and k/sub r/ $> 10^{-8}$ cm^3 s^{-1}. On colloidal CdS, however, no dependence of Phi on Δt was observed, indicating that k/sub e/ $> 3 \times 10^{11}$ s^{-1}, k/sub r/ $< 3 \times 10^{-7}$ cm^3 s^{-1}, and k/sub h/k/sub e/ $< 10^{-3}$.

37185 **Intramolecular photochemical electron transfer. 4. Singlet and triplet mechanisms of electron transfer in a covalently linked porphyrin-amide-quinone molecule.** Schmidt, J.A.; McIntosh, A.R.; Weedon, A.C.; Bolton, J.R.; Connolly, J.S.; Hurley, J.K.; Wasielewski, M.R. (Univ. of Western Ontario, London (Canada)). *Journal of the American Chemical Society;* **110**: No. 6, 1733-1740(16 Mar 1988). Contract AC02-83CH10093;W-31-109-ENG-38.

The authors have carried out an extensive photophysical analysis of a tetraarylporphine linked through a single amide bridge to either methyl-p-benzoquinone (PAQ) or the corresponding hydroquinone ($PAQH_2$) in benzonitrile as the solvent. The photophysical properties of $PAQH_2$ are closely similar to those of nonlinked tetraarylporphine species, while for PAQ significant lifetime quenching of both the lowest excited singlet and triplet states is observed. Picosecond transient absorption spectroscopy and fluorescence lifetime measurements were used top show that quenching of the excited singlet state of PAQ is due to intramolecular electron transfer to the singlet radical ion pair ^{1}(P/sup .+/AQ/sup .-/) with the rate constant of 4.1 (+-0.3) x 10^9 s^{-1}. ^{1}(P/sup .+/AQ/sup .-/) subsequently decays to the ground state by reverse electron transfer with a rate constant of 1.6 (+- 0.2) x 10^8 s^{-1}. This reaction has $\Delta G^\circ \approx$ -1.4 eV and is predicted by Marcus theory. Nanosecond flash photolysis studies show that the lowest triplet state of PAQ is also quenched, most likely by electron transfer to the triplet radical ion pair ^{3}(P/sup .+/ AQ/sup .-/, with a rate constant of 4.6 (+-0.2) x 10^4 s^{-1}. They suggest that ^{3}(P/sup .+/AQ/sup .-/), which then decays rapidly to the ground state.

37186 **Photoaddition and photoreduction of chloranil with arenes via singlet and triplet excited complexes: effects of irradiation wavelength and radical ion pair spin multiplicity.** Jones, G. II; Haney, W.A.; Phan, X.T. (Boston Univ., MA (USA)). *Journal of the American Chemical Society;* **110**: No. 6, 1922-1929(16 Mar 1988).

The photochemistry of chloranil (Q) in the presence of the arenes hexamethylbenzene, 1-methyl-, 1,3-dimethyl-, 1,4-dimethyl-, and 2,3-dimethylnaphthalene, and acenaphthene has been investigated. Irradiation in a nonpolar solvent provided ether adducts resulting from formal addition of the quinone to the arene side chain, the hydroquinone, (QH_2), and in one case, an identifiable oxidation product, acenaphthylene. The quantum yield for these transformations was shown to have a complex dependence on the concentration of the arene and irradiation wavelength. On irradiation at 366 nm under conditions in which free chloranil absorbs, the preferred product was the reduced species, QH_2. On irradiation at 436 nm under conditions in which the ground-state charge-transfer (CT) complex of Q and the arene chiefly absorbs, the preferred product was the ether adduct. Excitation of complexes at 546 nm resulted in a sharply reduced quantum yield. Flash photolysis studies show that the quenching of Q triplets by the arenes leads to free radicals (QH/sup ./ and DH/sup ./) by a sequential electron-transfer, proton-transfer mechanism. Irradiation of QDH_2 complexes appears alternatively to lead to singlet radical ion pairs (Q/sup .-/, DH_2/sup .+/) which evolve into singlet radical pairs (QH/sup ./, DH/sup ./) and final products in competition with back reactions which return radical pairs to ground-state reactants.

37187 **Photosensitization of triplet carotenoid in photosynthetic light-harvesting complex of photosystem II.** Nechushtai, R.; Thornber, J.P.; Patterson, L.K.; Fessenden, R.W.; Levanon, H. (Univ. of California, Los Angeles (USA)). *Journal of Physical Chemistry;* **92**: No. 5, 1165-1168(10 Mar 1988).

A laser photolysis study, on the nanosecond time scale, has been carried out on the major light-harvesting chlorophyll-protein complex of photosystem II (LHC IIβ). The transient triplet absorption of the isolated LHC IIβ has been compared to those of its constituent chromophores in dilute micellar aqueous solutions, namely, chlorophyll a, chlorophyll b, chlorophyll a + chlorophyll b, and chlorophyll a + β-carotene. The results indicate that the carotenoid in the LHC IIβ is photosensitized by triplet chlorophyll a and that the decay of the transient triplet absorption exhibits two transients, one in the ~ 50-ns range and the other in the ~ 10μs time scales. The former transient is light-intensity dependent and is attributed to an annihilation process between two triplets of chlorophyll a, while the latter is due to the decay of the triplet carotenoid to its ground state.

37188 **FT ESR study of photoinduced electron transfer.** Prisner, T.; Dobbert, O.; Dinse, K.P.; van Willigen, H. (Univ. of Dortmund (West Germany)). *Journal of the American Chemical Society;* **110**: No. 5, 1622-1623(2 Mar 1988). Contract FG02-84ER13242.

With Fourier transform ESR (FT ESR) well resolved spectra of organic free radicals can be obtained even if the free induction decay, following a $\pi/2$ microwave pulse, is as short as 1 μs. This makes the technique particularly suitable for the study of short-lived radicals. Results are presented of a FT ESR study of a transient free radical generated in a reversible photoinduced electron transfer reaction. The reaction and spin dynamics have been monitored from the time the radical is generated with nanosecond time resolution. The technique provides data complementary to those provided by flash photolysis.

37189 **Variable photon energy photoelectron spectroscopic studies of copper chlorides: an experimental probe of metal-ligand bonding and changes in electronic structure on ionization.** Didziulis, S.V.; Cohen, S.L.; Gewirth, A.A.; Solomon, E.I. (Stanford Univ., CA (USA)). *Journal of the American Chemical Society;* **110**: No. 1, 250-268(6 Jan 1988).

Variable photon energy photoelectron spectra (PES) are reported for the valence band region of cuprous and cupric chlorides for photon energies between 22 and 1253.6 eV. Intensity changes of the PES peaks observed with variation of photon energy are associated with (1) the photoionization cross sections of Cu 3d and Cl 3p atomic orbitals, (2) the Cooper minimum of the Cl 3p orbitals, and (3) resonance effects at the Cu 3p absorption edge. These effects allow a definitive assignment of specific PES features, an experimental estimate of covalent mixing between metal and ligand orbitals for all valence levels, and a quantitative evaluation of relaxation effects on the ionized final states. The intensity changes of the $CuCl_4^{2-}$ PES peaks are found to be dramatically different from those of $CuCl_4^{2-}$, a result of increased covalent mixing in the cupric chlorides. Quantitative analysis of the PES data indicates that in D/sub 4h/$CuCl_4^{2-}$, the highest energy level has less covalent mixing

than the D/sub 4h/ salt (68% Cu 3d character), while the mixing averaged over all the metal levels increases (76% Cu 3d).

37190 **(AERE-R—12798) Radiolytic oxidation. Progress report 1st January 1987 to 1st July 1987.** Ewart, F.T.; Hall, K.R.R.; Smith, A.J.; Walters, W.S.; Williams, S.J. (UKAEA Harwell Lab. Chemistry Div.; Department of the Environment, London (UK)). Feb 1988. 14p. (DOE-RW—87.117). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753505/JAW.

Progress made under the Radiolytic Oxidation contract during the period January to June 1987 is reported. Further work on irradiation of neptunium (IV) hydroxide by ^{60}Co confirms that in concrete waters of high pH radiolytic oxidation is unlikely to be important although at pH values less than 12 evidence for oxidation has been noted. The feasibility of monitoring U(IV) oxidation to U(VI) by measuring the total uranium concentration in solution has been demonstrated. Some work in other areas of the programme is briefly described.

37193 **(IPEN-Pub—125) Mathematical model applied to decomposition rate of RIA radiotracers: ^{125}I-insulin used as sample model.** Mesquita, C.H. de; Hamada, M.M. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)). Sep 1987. 17p. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702401/JAW.

A mathematical model is described to fit the decomposition rate of labelled RIA compounds. The model was formulated using four parameters: one parameter correlated with the radioactive decay constant; the chemical decomposition rate 'K/sub */' of the radiolabelled molecules; the natural chemical decomposition rate 'K' and; the fraction 'f/sub */' of the labelled molecules in the substrate. According to the particular values that these parameters can assume, ten cases were discussed. To determine one of these cases which fit the experimental data, three types of samples were need: radioactive; simulated radiotracer ('false radiolabelled') and; on labelled common substrate. The radioinsulin ^{125}I was used as an example to illustrate the model application. The experimental data substantiate that the insulin labelled according to the substorchiometric procedures and kept at freezer temperature were degraded with K=0.45% per day.

37194 **(JINR—12-87-712) Effect of accelerated heavy ions on polycarbonate.** Aprel', P.Yu.; Kravets, L.I.; Kuznetsov, V.I.; Didyk, A.Yu. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1987. 11p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702899/JAW.

Submitted to the journa High Energy Chem.

The radiation-chemical processes in polycarbonate film irradiated with nitrogen and xenon ions (energy ca. 1 MeV/nucleon) were investigated. The method of chemical etching monitored by measuring the electrical conductivity of the film was used for the study of structure and size of tracks. Basing on the comparison of conductometric, spectrophotometric and viscosimetric data it has been found that under the ion-irradiation the processess of destruction and cross-linking occur simultaneously in polycarbonate. The destruction predominates in the track core with a diameter of a few nanometers. The effects related to the formation of cross links between macromolecular chains appear at the distances of 5-30 nm from the path of a heavy ion. The hypothesis is suggested that such a distribution of the chain scission and cross-linking events could be typical for other polymers. 19 refs.; 4 figs.

37195 **Pulse radiolysis study to probe reduced platinum colloids in aqueous solution using optical and conductivity techniques.** Rabani, J.; Fessenden, R.W.; Sassoon, R.E. (Hebrew Univ., Jerusalem (Israel)). *Journal of Physical Chemistry;* **92**: No. 8, 2379-2385(21 Apr 1988).

Measurements of conductance changes accompanying the pulse radiolysis of aqueous solutions containing 2-propanol, methylviologen (MV^{2+}), and colloidal Pt (Ptc) have been carried out in parallel with optical absorption measurements on the same systems in order to investigate the reactions involved in the loading of Ptc with reducing equivalents. Two stages could be distinguished in the equilibration of MV^+, MV^{2+}, H^+, H_2, and Ptc. The faster process, which was over in about 6 ms, is attributed to the equilibrium involving MV^+, MV^{2+}, and H^+ with Ptc while the slower process which takes ~ 100 ms or more, is suggested to involve H_2 produced by radiolysis. At pH values in the range 9-11, the conductivity signal was found to decay more slowly and to a smaller extent than the optical absorption. Thus the injection of charge into the catalyst particle is faster than the protonation of the charged catalyst. The number of protons absorbed per electron increases with time to a value of about 0.7. Optical experiments at near-neutral pH suggested the adsorption of MV^{2+} on the catalyst to be important.

37196 **Critical Review of rate constants for reacitons of hydrated electrons.** Buxton, G.V.; Greenstock, C.L.; Phillips Helman, W.; Ross, A.B. (Theoretical Astrophysics 130-33, California Institute of Technology, Pasadena, California 91125). *Journal of Physical and Chemical Reference Data;* **17**: No. 2, 513-886(Apr 1988).

Kinetic data for the radicals Hx and xOH in aqueous solution,and the corresponding radical anions, xO^- and e/sub =/, have been critically reviewed. Reactions of the radicals in aqueous solution have been studied by pulse radiolysis, flash photolysis and other methods. Rate constants for over 3500 reaction are tabulated, including reaction with molecules, ions and other radicals derived from inorganic and organic solutes.

37197 **Radical cations in pulse radiolysis of liquid alkanes. Time-resolved fluorescence detected magnetic resonance.** Werst, D.W.; Trifunac, A.D. (Argonne National Lab., IL (USA)). *Journal of Physical Chemistry;* **92**: No. 5, 1093-1103(10 Mar 1988).

Alkane and olefin radical cations are characterized by time-resolved fluorescence detected magnetic resonance (FDMR) in pulse radiolysis of neat alkane liquids and binary alkane mixtures at room and low temperatures (~ 180K). FDMR-EPR spectra of the cis-decalin radical cation and the norbornane radical cation are detected a low concentrations (10^{-3}-10^{-1} M) of cis-decalin and norbornane, respectively, in alkane mixtures. Parent minus H_2 olefin radical cations are observed in neat alkanes and in alkane mixtures. Studies of the temperature and concentration dependences of olefin cation formation suggest that olefin cations originate in the fragmentation of parent alkane cations and that this reaction depends on the energy content of the parent cation. Other possible reactions of alkane radical cations are discussed.

37198 **Geminate radical ions in polar solvent radiolysis. Time resolved fluorescence detected magnetic resonance (FDMR).** Percy, L.T.; Werst, D.W.; Trifunac, A.D. (Argonne National Lab., IL (USA)). *Radiation Physics and Chemistry, International Journal of Radiation Applications and Instrumentation Part C;* **32**: No. 2, 209-213(1988). Contract W-31-109-ENG-38.

Several polar liquids, dioxane, tetrahydrofuran, 1 and 2-propanol, 1-butanol, amyl alcohol and ethylene glycol were irradiated with 3MeV electron pulses and the presence of geminate ion pairs studied by fluorescence detected magnetic resonance (FDMR). Analysis of the FDMR spectra demonstrates production of excited states by recombination of geminate radical ion pairs and allows differentiation between different pathways leading to the production of excited states. (U.K.).

37199 **Computer simulation of the kinetics of gamma radiolysis of sodium tetraphenylborate solutions.** Gupta, A.K.; Hanrahan, R.J.; Walker, D.D. (Univ. of Florida, Gainesville, (USA)). pp 3 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Major products and corresponding G values in the Co-60 gamma radiolysis of 0.05 M sodium tetraphenylborate (NaTPB) solutions at 25°C are hydrogen (0.46), biphenyl (2.0), benzene (1.3), and phenol (0.41). A dose of 4.4 Mrad increased the pH from 8.2 (initial) to 9.2. A reaction scheme based on formation of H-, OH-, and e/sub aq/- with standard literature G-values was examined using computer modeling. Rapid electron transfer from TPB^- to OH- was assumed, forming OH^- and an unstable transient $B(C_6H_5)_4$ which decomposes to $B(C_6H_5)_3$ plus phenyl radical. Combination reactions between H-, OH-, and C_6H_5- form the observed products with yields matching observation within ca. 25%.

37200 **(CEGB-TPRD/B—0975/R87) Passivation of uranium metal surfaces by nitrogen bombardment - the formation of uranium nitride.** Allen, G.C.; Holmes, N.R. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Aug 1987. 14p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753605/JAW.

To be published in the Journal of Nuclear Materials.

As part of a detailed investigation of the behaviour of metallic uranium in various atmospheres, we have examined the reaction between nitrogen gas and uranium metal. At room temperature there was no evidence of reaction between nitrogen gas and a clean metal surface; the only changes observed could be attributed to reaction between the metal and traces of oxygen (less than 0.1 ppm) in the nitrogen gas. Reaction between the metal and nitrogen was induced however by accelerating nitrogen towards the surface using a fast atom gun. The resulting nitrided surface was characterised by X-ray photoelectron spectroscopy, and its oxidation behaviour was monitored over an extended period in UHV and in air.

37201 **(CONF-880435—9) Resonance ionization mass spectrometric study of the promethium/samarium isobaric pair.** Shaw, R.W.; Young, J.P.; Smith, D.H. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008083/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

Samarium daughters are problematic in isotope ratio measurements of promethium because they are isobaric. Resonance ionization mass spectrometry was utilized to circumvent this problem. An ionization selectivity factor of at least 1000:1 has been measured for promethium over samarium at 584.6 nm. Resonance ionization spectra have been recorded for both elements over the 528-560 and 580-614 nm wavelength ranges.

37202 **(GSI—87-71-Prepr.) Search for lawrencium as a p-element using gaschromatography techniques.** Jost, D.T.; Gaeggeler, H.W.; Vogel, C.; Eichler, B.; Gregorich, K.E.; Hoffman, D.C.; Schaedel, M.; Jaeger, E. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Paul Scherer Inst. (PSI), Wuerenlingen (Switzerland); Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic); Lawrence Berkeley Lab., CA (USA)). Oct 1987. 16p. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt, Germany, F.R.

Multidimensional relativistic Dirac-Fock calculations predict that the last member of the actinides series, Lr, might behave like a p-element with a [Rn] $5f^{14}$ $7s^2$ $7p_12$ ground state electronic configuration, rather than the traditionally expected [Rn] $5f^{14}$ 6d $7s^2$ configuration. On-line gaschromatography was applied to search for Lr as a volatile p-element. These investigations were performed with ^{260}Lr (t_12 = 3 min), produced in the $^{249}Bk(^{18}O,\alpha3n)$ reaction. Quartz and Pt chromatography columns were used. No evidence for Lr as a volatile element was found under reducing conditions and at a temperature of about 1000°C. Our results give a lower limit for the adsorption enthalpy -ΔH/sub a/ for Lr on quartz and Pt surfaces of 290 kJmol. This value is significantly higher than the estimated values for Lr(p).

37203 **(IPEN-Pub—121) Determination of the radiochemical purity of ^{51}Cr-EDTA.** Toledo e Souza, I.T. de; Pereira, N.P.S. de. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)). Aug 1987. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702398/JAW.

The miniature chromatography systems were elaborated to determine the radiochemical purity chromium ^{51}Cr-EDTA. Chromatography results using four different solvents were obtained and studied. 33% WV aqueous solution of ammonium sulfate pH 7.5 gives the best chemical separation was concluded.

37204 **(IPEN-Pub—123) Synthesis of 2,6-diisopropylphenylcarbamoylmethyl-iminodiacetic acid (DISIDA) and 4-n-p-butyl-phenylcarbamoylmethyl-iminodiacetic acid (BUTYL-IDA). Preparation of lyophilized kit to be used as ^{99}(supm)Tc agent in hepatobiliary system.** Hamada, E.S.; Barbosa, M.F. de; Theodora, M.A.; Almeida, M. de; Colturato, M.T.; Muramoto, E.; Silva, C.P.G. da. (Instituto de Pesquisas Energeticas e Nucleares, Sao Paulo (Brazil)). Aug 1987. 14p. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702400/JAW.

The synthesis of 2,6 diisopropyl IDA (DISIDA) and 4-n-butyl IDA (BUTIL-IDA) is described. Their spectroscopic properties, radiopharmaceutical preparation and their use as ^{99}(sup m)Tc complex agent in hepatobiliary studies, are also reported.

37205 (JINR-R—7-86-322, pp 16) **Search of spontaneously fissile isotopes of elements 107-110 in products of ^{235}U + ^{40}Ar (205 MeV) interaction by chemical method.** Domanov, V.P.; Timokhin, S.N.; Zhujkov, B.L.; Kim Son Chun; Ajkhler, B.; Chepygin, V.I.; Zvara, I. 1986. (In Russian). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88780065/JAW.

In Heavy ion physics - 1985. Collection of annotations of the Nuclear Reaction Laboratory of the Joint Nuclear Research Institute works, 1985.

37206 **(NIIAR—15(726)) Remote control and mathematical simulation of ion exchange processes for transplutonium element separation.** Tselishchev, I.V.; Elesin, A.A. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1987. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702951/JAW.

The algorithm has been considered for calculation of the elution curves of the ion-exchange transplutonium element separation processes according to the results from the remote monitoring.

Such calculations make it possible to determine in the course of the process its quality, to estimate both the boundaries for the optimal functioning and the basic technological characteristics. The example of calculations of the curium and americium as well as einsteinium and californium separation processes are presented. 3 refs.; 2 figs.; 1 tab.

37207 **(UCRL—97401) HE^3 outgassing from four working palladium and uranium beds.** Souers, P. C.; Coronado, P. R.; Fearon, F. M.; Garza, R. G.; Shaw , J. F.; Stump, R. K.; Tsugawa, R. T. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 12p. (CONF-880505—25). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011338/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

The He^3 output from two palladium and two uranium beds storing T_2 and D-T was studied as a function of time. Three of the beds were started new and watched for a year; the fourth bed was twelve years old. All four were beds used in routine tritium handling. Initial stoichiometries were PdT/sub 0.3/ and UT/sub 0.7/ so that both operated at similar 1 to 130 kPa pressures. The He^3 from palladium ranged from the 0.002 mo1% lower level of sensitivity to 0.01% for PdT_2 at one year of age. The UT system showed 0.1% He^3 at 4 to 62 days and 0.1 to 10% at longer times, with the first cuts being high in He^3. The palladium bed with 95 to 97% pure T_2 enriches the output to as high as 97 to 99%. 9 refs., 1 fig., 2 tabs.

37208 **(UCRL—97402) Increase of tritium permeation through resistant metals at 323 K by lattice defects.** Maienschein, J. L.; McMurphy, F. E.; DuVal, V. L. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 21p. (CONF-880505—24). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011339/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

We report data on tritium permeation at 323 K and 373 K through annealed and single crystal copper for comparison with our earlier data on unannealed copper, and show that tritium transport along grain boundaries or other lattice defects controls the overall rate at 323 K in unannealed material. Measurements on unannealed and annealed gold foil also indicate the importance of defect transport, although with gold we could not reduce the defect concentration sufficiently to measure permeation through the metal lattice. We also include permeation data on aluminum, molybdenum, tungsten, beryllium, cadmium, iridium, lead, rhenium, and silver; all of these were probably dominated by tritium transport along lattice defects. 24 refs., 3 figs., 3 tabs.

37209 **(UCRL—97406) Synthesis and stability of liquid molecular DT.** Souers, P.C.; Fearon, E.M.; Garza, R.G.; Griffith, C.M.; Mayhugh, S.R.; Mapoles, E.R.; Tsurgawa, R.T.; Sater, J.D.; Collins, G.W.; Gaines, J.R. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 17p. (CONF-880505—27). NTIS, PC A17/MF A01;1; GPO Dep. Order Number DE88011349/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

Regular equimolar deuterium-tritium is a mixture of 25 mol% T_2-50% DT-25% D_2. We have synthesized molecular DT of greater purity by the reaction $LiT + CH_3OD \rightarrow DT + LiOCH_3$, run at 243{degree}K. With both the alcohol and reactor-to-cryostat transfer lines at room temperature, we obtain 88 mol% DT purity. By cooling the alcohol and holding the transfer lines at 80{degree}K, the yield rose to 95% DT. The DT disproportionated to D_2 and T_2 with a le-time constant of about 100 hours in the liquid at 20.5{degree}K. Nuclear magnetic resonance data showed that the eventual T_2-DT-D_2 equilibrium is probably a {open quotes}hot-atom{close←quotes} one.

37210 **(UCRL—97406-Rev.1) Synthesis and stability of liquid molecular DT.** Souers, P.C.; Fearon, E.M.; Garza, R.G.; Friffith, C.M.; Mayhugh, S.R.; Mapoles, E.R.; Tsugawa, R.T.; Sater, J.D.; Collins, G.W.; Gaines, J.R. (Lawrence Livermore National Lab., CA (USA); Hawaii Univ. at Manoa, Honolulu (USA). Dept. of Physics; Ohio State Univ., Columbus (USA). Dept. of Physics). May 1988. Contract W-7405-ENG-48. 5p. (CONF-880505—27-Rev.1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011723/JAW.

37211 **(UCRL—97513) Tritium labeling of amino acids and peptides with liquid and solid tritium.** Souers, P.C.; Coronado, P.R.; Peng, C.T.; Hua, R.L. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 8p. (CONF-880505—21). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011335/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

Amino acids and peptides were labeled with liquid and solid tritium at 21{degree}K and 9{degree}K. At these low temperatures radiation degradation is minimal, and tritium incorporation increases with tritium concentration and exposure time. Ring saturation in L-phenylalanine does not occur. Peptide linkage in oligopeptides is stable toward tritium. Deiodination in 3-iodotyrosine and 3,5-diiodotyrosine occurs readily and proceeds in steps by losing one iodine atom at a time. Nickel and noble metal supported catalysts when used as supports for dispersion of the substrate promote tritium labeling at 21 K. Our study shows that both liquid and solid tritiums are potentially useful agents for labeling peptides and proteins.

37212 **(UCRL—97518) Design of a tritium recovery system.** Sherry, R. J.; Miller, L. C. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 7p. (CONF-880505—23; CONF-880505—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011340/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

A new effluent cleanup system for tritium recovery (abbreviated VERS) has been designed by the Lawrence Livermore National Laboratory for use at their tritium facility in cleaning argon box atmospheres and pump exhausts. It is the standard catalyst-molecular sieve (zeolite) system, and is directly descended from the cleanup system at Mound Laboratory. This paper deals with several topics that represent possible engineering improvements as well as considering several areas of surprise and difficulty.

37213 **Thermal decomposition of curium tetrafluoride and terbium tetrafluoride.** Gibson, J.K.; Haire, R.G. (Oak Ridge National Lab., TN (USA)). *Journal of Solid State Chemistry;* 73: No. 2, 524-530(Apr 1988). Contract AC05-84OR21400.

The thermal decomposition of both curium and terbium tetrafluorides have been studied using mass spectrometry to monitor the effusate from a Knudsen cell containing the condensed fluoride. Curium tetrafluoride was found to decompose at 330-430°C in vacuum. A Second Law enthalpy of 26.3 +/- 2 kcal/mole (at 370°C) is derived from van't Hoff plots of results obtained for the decomposition reaction: $CmF_4(s) \rightarrow CmF_3(s) + 1/2F_2(g)$. Decomposition fluorine pressures are derived and comparison is made with related studies of terbium tetrafluoride carried out in conjunction with the curium experiments. The results are compared both with

data reported in the literature for lanthanide and actinide tetrafluorides and with predictions that have been made for CmF_4.

37214 **Low-symmetry, mixed-valent, μ-oxo technetium complexes with pyridine and halide ligands.** Clarke, M.J.; Kastner, M.E.; Podbielski, L.A.; Fackler, P.H.; Schreifels, J.; Meinken, G.; Srivastava, S.C. (Boston College, Chestnut Hill, MA (USA)). *Journal of the American Chemical Society;* **110**: No. 6, 1818-1827(16 Mar 1988).

Dinuclear, asymmetric, and dissymmetric μ-oxo complexes of technetium in which the two Tc atoms are in intimate electronic communication, have been synthesized and structurally characterized. The two types of complexes are isomers differing in their arrangement of equatorial ligands around each technetium, with the configurations being X_4 and (pyridine)$_4$ for the dissymmetric case and X_3(pyr) and (pyr)$_3$X for the asymmetric. A compound representative of the asymmetric complexes, [(Pic)Cl_3(Pic)Tc-O-TcCl(Pic)$_3$Cl] (III), crystallizes in the monoclinic space group $P2_1n$ with the following unit cell parameters: a = 12.421 A, b = 15,471 A, c = 18.764 A, β = 93.174°, and Z = 4. The geometry is essentially octahedral around each Tc, with the equatorial ligands on the opposite metal atoms being staggered relative to one another. Dissymmetric complexes of the type [X(L)$_4$Tc-O-TcX$_4$L], where X = Cl or Br and L = pyridine, 4-picoline, and 3,5 lutidine, are also formed by spontaneous self-assembly but are immediately derived from the asymmetric species. In the solid state, both types of compounds exhibit a small magnetic moment (μ/sub eff/ ~ 0.9-1.3 β). EPR spectra of the dissymmetric complex, [Cl(Pic)$_4$Tc-O-TcCl$_4$(Pic)] (I), whose structure has been previously reported, are consistent with an axial, binuclear species, containing splitting by two I = $^9/_2$ metal nuclei. Infrared Tc-O stretching frequencies are in the range 698-726 cm^{-1}, while Tc-Cl bands appear in the range 305-317 cm^{-1} and Tc-Br at at 235-266 cm^{-1}. Tissue distributions of these complexes in animals are reported and discussed.

37215 **[$(CH_3)_3C_5$]$_2$TH(CH_3)$_2$ surface chemistry and catalysis. Direct NMR spectroscopic observation of surface alkylation and ethylene insertion/polymerization on $MgCl_2$.** Hedden, D.; Marks, T.J. (Northwestern Univ., Evanston, IL (USA)). *Journal of the American Chemical Society;* **110**: No. 5, 1647-1649(2 Mar 1988). Contract FG02-86ER13511.

It is well-established that adsorption on inorganic surfaces can dramatically alter the reactivity of organometallic molecules; however, the structural chemistry of the resulting adsorbates is frequently ill-defined. From CPMAS NMR studies of Cp'$_2$Th(CH_3)$_2$ (Cp' = eta^5-(CH_3)$_5C_5$) on dehydroxylated γ-alumina (DA), they inferred the transfer of methyl groups to DA surface Lewis acid sites and the formation of less saturated Cp'$_2$Th(CH_3)$^+$ species with cationic character. Although model studies in solution support much of this chemical/spectroscopic hypothesis, the small percentage (≦ 4%) of Cp'$_2$Th(CH_3)$_2$/DA sites highly active for olefin hydrogenation and polymerization renders the connection with catalysis necessarily indirect. Complementary studies with high surface area $MgCl_2$, the preferred support for third generation Ziegler-Natta catalysis, are reported which provide the first evidence for the catalytic importance of methylmethide transfer on $MgCl_2$ and the first direct spectroscopic observation of the ethylene insertion/polymerization process on a supported catalyst.

37216 **Metal, bond energy, and ancillary ligand effects on actinide-carbon σ-bond hydrogenolysis. A kinetic and mechanistic study.** Lin, Z.; Marks, T.J. (Northwestern Univ., Evanston, IL (USA)). *Journal of the American Chemical Society;* **109**: No. 26, 7979-7985(23 Dec 1987). Contract AC02-81ER10980;FG02-86ER13511.

A kineticmechanistic study of actinide hydrocarbyl ligand hydrogenolysis (An-R + H_2 → An-H + RH) is reported. For the complex Cp'$_2$TH(CH_3-t-Bu)(O-t-Bu)(Cp' = eta^5-Me_5C_5), the rate law is first-order in organoactinide and first-order in H_2, with k/sub H2/k/sub D2/ = 2.5 (4) and k/sub THF/k/sub toluene/ = 2.9 (4). For a series of complexes, hydrogenolysis rates span a range of ca. 10^5 with Cp'$_2$ThCH$_2$C(CH_3)$_2$CH$_3$ ≈ Cp'$_2$U(CH_2-t-Bu) (too rapid to measure accurately) > Cp'$_2$Th(CH_2-t-Bu)[OCH(t-Bu)$_2$] = Cp'$_2$Th(CH_2-t-Bu)(O-t-Bu) > Cp'$_2$Th(CH_2-t-Bu)(Cl) > $Me_2Si(Me_4C_5)_2$Th(n-Bu)$_2$ > Cp'$_2$Th(n-Bu)$_2$ ≈ Cp'$_2$ThMe$_2$ > Cp'$_2$Th(Me)(O_3SCF_3) > Cp'$_2$Th(n-Bu)[OCG(t-Bu)$_2$] ≈ Cp'$_2$Th(Me)[OSiMe$_2$(t-Bu)] > Cp'$_2$ZrMe$_2$ = Cp'$_2$Th(rho-$C_6H_4NMe_2$)(O-tu-Bu) > Cp'$_2$Th(Ph)(O-t-Bu) > Cp'$_2$U(Me)[OCH(t-Bu)$_2$] > Cp'$_2$Th(Me)[OCH(t-Bu)$_2$]. In the majority of cases, the rate law is cleanly first-order in organoactinide over 3 or more half-lives. However, for Cp'$_2$ThMe$_2$ → (Cp'$_2$ThH$_2$)$_2$, an intermediate is observe by NMR that is probably [Cp'$_2$Th(Me)(μ-H)]$_2$. For Cp'$_2$Th(Me)(O_3SCF_3), a follow-up reaction, which consumes Cp'$_2$TH(H)(O_3SCF_3) is detected. Variable-temperature kinetic studies yield $\Delta H^{\ddagger\ddagger}$ = 3.7 (2) kcalmol and ΔS double dagger = -50.8 (7) eu for Cp'$_2$Th(CH_3-t-Bu)(O-t-Bu) and ΔH double dagger = 9 (2) kcalmol and ΔS double dagger = -45 (5) eu for Cp'$_2$U(Me)[OCH(O-t-Bu)$_2$].

37217 **Iodine-129 Moessbauer study of actinide iodides.** Karraker, D.G. (E. I. du Pont de Nemours and Company, Aiken, SC (USA)). *Inorganic Chemistry;* **26**: No. 22, 3816-3818(4 Nov 1987). Contract AC09-76SR00001.

Iodine-129 Moessbauer spectra of four actinide iodides, ThI_4, UI_4, NpI_3, and PuI_3 have been studied. The ^{129}I Moessbauer spectra of the iodides all showed a single asymmetric resonance with inflections in the envelope. The inflections and asymmetry of the envelope were interpreted to indicate that the normal ^{129}I quadrupole splitting was too small to be resolved. No significant differences were noted for the Moessbauer parameters among the four iodides. However, unexpected differences were noted in the isomer shifts and quadrupole coupling constants for lanthanide iodides and actinide iodides. 16 references, 2 figures, 2 tables.

37218 **Crystal-field analysis of Bk^{4+}:CeF_4.** Jursich, G.M.; Carnall, W.T.; Goodman, G.L. (Argonne National Lab., IL (USA)). pp 3 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-31-109-ENG-38.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

CeF_4 is isostructural with UF_4 which, in turn, provides a good structural model for other tetrafluoro-actinides. This structure entails an 8-fold coordination with neighboring fluorine atoms arranged in a distorted square antiprism. There are two distinct low-symmetry actinide sites in this class of compounds which can make spectra interpretation difficult due to both the possible multiplicity of absorption lines from the two sites and the complexity of the computational fitting because of the low symmetry involved. One approach to this problem is to approximate the antiprismatic structure as a single D/sub 4d/ site symmetry. Recently they recorded low-temperature fluorescence and excitation spectra on Bk^{4+}:CeF_4 up to 27,500 cm^{-1}. They report the results of their fitting of this data within a higher symmetry single site approximation and, then, extend the analysis to the spectra of other tetrafluoro-actinides.

37219 **Studies on the hydrolysis and carbonate complexation of dioxoplutonium(V).** Bennett, D.A.; Nitsche, H.; Silva, R.J.; Hoffman, D.C. (Lawrence Berkeley Lab., CA (USA)). pp 4 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC03-76SF00098.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The pentavalent oxidation state of plutonium in aqueous solution is thermodynamically unstable with respect to disproportionation into the +4 and +6 oxidation states at low pH. Consequently, the solution chemistry on Pu(V) has not been extensively investigated. However, because of the pH dependence of the disproportionation reaction, Pu(V) can be a dominant species in near neutral solutions. Therefore, the hydrolysis and carbonate complexation constants are important parameters to measure. Absorption spectrophotometry is being used to measure the stability constants. The spectrophotometer utilized in these experiments has the unique advantage of fiber optics which add new capabilities to this technique.

37220 Solution chemistry of uranium in $POCl_3$ ($SnCl_4$). Blaha, S.L.; Anderson, C.J.; Choppin, G.R.; Pruett, D.J. (Florida State Univ., Tallahassee (USA)). pp 4 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Studies are being carried out with uranium in the nonaqueous solvent $POCl_3$ with 5 mole percent $SnCl_4$. This solvent has been studied as a solvent for liquid lasers, since it minimizes radiationless decay. Solutions of anhydrous U(IV) chloride in optically clear $POCl_3$ ($SnCl_4$) have been prepared and investigated by spectrophotometry. The spectra of the U(IV) varied with increasing concentrations of sodium acetate. The spectra were analyzed for formation of uranium (IV) acetate complexes. Comparison of the acetate complexation and the associated spectra with the analogous aqueous systems will be discussed. This research was supported through a contract with the Chemical Technology Division of the Oak Ridge National Laboratory.

37221 Dissociation kinetics of uranyl from humic acid. Clark, S.B.; Choppin, G.R. (Florida State Univ., Tallahassee (USA)). pp 4 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The rate of dissociation of uranyl from humic acid has been investigated using spectroscopic techniques. The multicomponent first-order dissociation was found to be dependent on contact time prior to dissociation, as well as on pH and temperature. As the predissociation time is increased up to 48 hours, the amount of uranyl dissociating by the slower pathways increases. After 48 hours, no change is observed in either the rates of these pathways or the percent of uranyl dissociating by each pathway. The overall rate of dissociation is inversely dependent on pH, but increases with temperature. The general dissociation rate equation, rate constants, and activation energies have been determined using a kinetic spectrum method. From these values, a model for the kinetics of uranyl-humic acid interaction has been developed.

37222 Reduction kinetics of the dioxouranium(VI) ion bound to synthetic polyelectrolytes in aqueous solutions. Meisel, D.; Sullivan, J.C.; Pippin, C.G.; Choppin, G.R. (Argonne National Lab., IL (USA)). pp 5 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-31-109-ENG-38.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The characterization of actinide ion interactions with naturally occurring polyelectrolytes (e.g., humic substances) is necessary for developing a satisfactory model of actinide behavior in ecosystems. Synthetic polyelectrolytes having only carboxylic acid functional groups can be used to assess the importance of these groups in humic substances. This study examines the reduction of the dioxouranium (VI) ion in the presence of poly (acrylic acid) and poly (maleic acid) using a viologen radical generated by pulse-radiolysis techniques. The observed rate parameters for dioxo-uranium (VI) reduction show unexpected results as a function of polyelectrolyte concentration, degree of neutralization, and contact time. These results along with a possible mechanistic interpretation are discussed.

37223 ^{238}U double beta decay experiment. Turkevich, A.L.; Cowan, G.A.; Lawrence, F.; Knight, S.; Economou, T.; Haxton, W.C. (Univ. of Chicago, IL (USA)). pp 7 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The double beta decay of ^{238}U to ^{236}Pu (Q = 1.146 MeV) is being studied by a radiochemical technique. In 1950 a lower limit of 6×10^{18} yr was set for the half life, but recently interest has been revived in this system. Theoretical estimates range from 2.2×10^{19} to 1.5×10^{20} yrs. However, such estimates have been too short in the few cases of other nuclides for which experimental results exist. The present experiment uses 13 Kg of depleted uranium in 150 liters of a carbonate solution at pH 7.3. The cupferron complex of plutonium is periodically extracted into 4 liters of chloroform and the latter is evaporated and ignited. The plutonium is purified using ion exchange columns, and the 5.49 MeV alphas of ^{238}Pu are measured in counters having backgrounds of $\sim$ 0.05 events per day in a region of $\sim$ 150 KeV. The overall efficiency of the process can be monitored by the recovery of ^{239}Pu produced by spontaneous fission (4.5 decays per day after 90 days' accumulation). A half life for double beta decay of ^{238}U of 10^{20} yrs will lead to 1.2 disintegrations of ^{238}Pu per day after 90 days' accumulation.

37224 Mass spectrometric measurement of $^{100}Mo \rightarrow {}^{100}Ru + 2\beta^- + 2anti\ nu$. Rundberg, R.S.; Wolfsberg, K.; Rokop, D.J.; Perrin, R.E.; Murrell, M.T.; Curtis, D.B.; Cowan, G.A.; Bryant, E.A.; Attrep, M. (Los Alamos National Lab., NM (USA)). pp 7 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The half-life for 0nu double beta decay depends on the neutrino mass, and among other things on nuclear structure effects. Limits on the half-life for 2nu double beta decay have been established which are considerably longer than expected. A recent theoretical treatment, which attempts to explain the suppression of the double beta decay rate by including the particle-particle component of the spin-isospin polarization force, predicts a relatively short half-life for ^{100}Mo. The half-life predicted using an interaction strength based on an analysis of EC/β^+ decay rates is within the limit of sensitivity of mass spectrometry for ruthenium extracted from 200 kg of sodium molybdate. This experiment will provide an experimental basis for the nuclear structure effect which is needed to calculate a neutrino mass from the 0nu half-life (to be measured in an independent experiment). Thus the chemical experiment complements the charged particle detector experiments underway. The talk will describe the proposed experiment to be performed at Los Alamos.

37225 Atomic mass identification of CF-252 fission fragments using an NE-102 thin film detector. Milosevich, Z.; Muga, M.L.; Burnsed, D.J.; Thompson, S.D.; Coldwell, R.L. (Univ. of Florida, Gainesville (USA)). pp 8 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract FG05-84ER40149.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The measurement of atomic number of low energy Cf-252 fission products using a three element thin film scintillation detector in conjunction with a residual energy solid state detector is described. Critical comparison of the separate spectra yielded by the three thin film elements is used to show both quantitative and qualitative consistency. Through the use of simple data handling techniques, increased resolution between peaks is easily obtained; the resultant spectrum for the distribution of both heavy and light fragments of Cf-252 is presented. The anticipated application of thin film scintillation techniques for event-by-event illucidation of decay schemes will also be discussed.

37226 Nuclear Bragg scattering of synchrotron radiation by $^{57}Fe_2O_3$: a novel method for monochromatization with $\Delta E/E = 10^{-12}$. Haustein, P.E.; Faigel, G.; Siddons, D.P.; Hastings, J.B.; Grover, J.R.; Remeika, J.P.; Cooper, A.S. (Brookhaven National Lab., Upon, NY (USA)). pp 8 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC02-76CH00016.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The monochromatization of white synchrotron radiation of kilovolt energies to bandwidths of 10^{-6} to 10^{-8} eV will open up new fields of research with important applications in diverse areas of chemistry, physics, and the material sciences. These will be based on the unique sensitivity and specificity of nuclear resonance techniques. Nuclear Bragg scattering of synchrotron radiation from enriched α-$^{57}Fe_2O_3$ has been observed at the BNL National Synchrotron Light Source for the first time without need for delayed coincidence techniques. Experimental details will be presented and applications of this new technique will be discussed. A particularly interesting one is the development of filtered synchrotron beams for excitation of Moessbauer nuclei for which there are no convenient radioactive progenitor nuclei available in nature.

37227 Sorption of radionuclides in tuff using groundwaters of various compositions. Knight, S.D.; Thomas, K.W. (Los Alamos National Lab., NM (USA)). pp 9 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Three natural and several synthetic groundwaters were used to investigate the sorptive properties of a few selected radionuclides on tuff. The natural groundwaters were pumped from wells in the Yucca Mountain area that is being considered by the Nevada Nuclear Waste Storage Investigations Project as a possible site for a nuclear waste repository. The synthetic groundwaters were prepared to identify which components had the greatest effect in changing the sorptive behavior of the radionuclides studied. The tuff samples had various mineralogic compositions which were characteristic of the Yucca Mountain area. The radionuclides selected for this study were ^{85}Sr, ^{137}Cs, ^{133}Ba, ^{152}Eu, and ^{113}Sn, all at low concentration levels ($<10^{-7}$ M). Observed changes in sorptive behavior with the different groundwaters were element-dependent, and within the concentration ranges studied, no single ionic species appeared to exert a controlling influence on the sorption of these radionuclides.

37228 Chemical aspects of the gallex solar neutrino experiment. Hahn, R.L. (Brookhaven National Lab., Upton, NY (USA)). pp 12 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC02-76CH00016.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The Gallex solar neutrino experiment, described in the previous paper, will utilize 30 tons of gallium, in the form of an aqueous solution of 8M $GaCl_3$, as a radiochemical detector of solar neutrinos. The capture of a neutrino by ^{71}Ga will initiate inverse β decay and produce ^{71}Ge, which decays with an 11.2-day half-life. This talk will focus on the chemical steps that have been devised to separate the minute amounts of product germanium from the gallium solution and to convert the ^{71}Ge to a chemical form suitable for inclusion in a proportional counter. Questions concerning the specification and determination of impurity levels in the $GaCl_3$ solution, so as to preclude reactions on impurities that would mimic the capture of a solar neutrino by ^{71}Ga, will also be discussed.

37229 Search for the monovalent species, mendelevium 1^+. Payne, G.F.; Keller, O.L.; Halperin, J.; Wilmarth, W.R.; Peterson, J.R.; Lougheed, R.W.; Silva, R.J.; Hulet, E.K. (Oak Ridge National Lab., TN (USA)). pp 17-18 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The claimed production by Mikheev of Md^{1+} in aqueousalcoholic solutions has not been confirmed by others. The authors are taking a new approach using aprotic solvents. If Mikheev's work is correct, Md^{2+} should be attainable by Zn reduction in such solvents. If Mikheev's work is correct, Md^{1+} should be attainable by Zn reduction in such solvents. If not it should be reduced to Md^{3+}. The oxidation state determination will be made by ion exchange techniques. They have shown the log K/sub d/ for Cs^{1+} tracer vs log Na^{1+} concentration gives a slope of -1 in a solution of benzonitrile containing $NaClO_4$ as supporting electrolyte. Similarly they have obtained a slope of -1 for Eu^{2+} (after reduction from Eu^{3+}) and Sr^{2+} tracers vs log Ba^{2+} with $BaClO_4$ as supporting electrolyte. Thus the reduction of Md^{3+} to Md^{1+} can be established by exchanging against Na^{1+} as supporting electrolyte and the reduction to Md^{2+} by exchanging against Ba^{2+} (using Amberlyst 15 or Nafion 117 resins). Results of the mendelevium experiments are presented.

37230 Non-eka-tantalum behavior in Ha (element 105). Gregorich, K.E.; Henderson, R.A.; Bennett, D.A.; Chadwick, R.B.; Chasteler, R.M.; Gannett, C.M.; Hall, H.L.; Lee, D.; Leyba, J.D.; Nurmia, M.J.; Seaborg, G.T. (Univ. of California, Berkeley (USA)). pp 18 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC03-76SF00098.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The authors have attempted a chemical identification of 35-s ^{262}Ha by extraction of the HaF_7^{2-} complex into methyl isobutyl ketone. ^{262}Ha was produced by the $^{249}Bk(^{18}O,5n)^{262}Ha$ reaction at an ^{18}O energy of 101 MeV. The total processing time, from end of bombardment to the start of counting for alpha and SF decays of ^{262}Ha, averaged 50 s. The procedure was tested using ^{173}Ta produced by the $^{159}Tb(^{18}O,5n)^{173}Ta$ reaction, and with ^{182}Ta tracer. In 335 individual experiments, no Sf events or alpha decays of ^{262}Ha or its daughter, ^{258}Lr, were detected. Based on published production cross sections and alpha/SF branching ratios, and on their own measurements, they estimate that they should have seen 27 fissions and 6 alphas. It appears that the F^- complexation of Ha is different from that of its lighter homolog, Ta, possibly due to the stabilization of lower oxidation states in Ha such as Ha^{3+} with the configuration $[Rn]7s^25f^{14}$.

37231 Spectroscopic and photophysical opportunities and challenges in laser excitation studies of transplutonium species in solution. Beitz, J.V. (Argonne National Lab., IL (USA)). pp 20-21 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Laser excitation of transplutonium (TPU) ions can populate the electronic states most characteristic of actinide ions which are 5f electron states. This method affords unique opportunities to establish 5f state energy level structure, transition intensities and photodynamics of aquo and complexed TPU ions in solution. For instance, laser-induced fluorescence studies of 5f states of Am^{3+}, Cm^{3+}, Bk^{3+} and Es^{3+} as aquo ions have resulted in the first systematic and predictive understanding of TPU ion non-radiative decay in aqueous solution and have provided evidence concerning innersphere coordination of water when Am^{3+} is extracted from an

aqueous solution into an organic phase. The demonstrated high sensitivity of laser excitation techniques, including photoacoustic and thermal lensing methods, have created opportunities to study TPU ion speciation and complexation at concentrations typical of those expected in near-neutral pH solutions or in aqueous and organic process streams. Examples of the current application of laser excitation techniques to TPU ions in solution and future research opportunities will be presented.

37232 **Berkelium chemistry in complexing aqueous solutions and in the solid state.** Hobart, D.E.; Morris, D.E.; Palmer, P.D.; Haire, R.G.; Peterson, J.R. (Los Alamos National Lab., NM (USA)). pp 21 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-36;AS05-76ER04447;AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Although the chemistry of berkelium is reasonably well known in mineral acid solutions, there is a lack of extensive knowledge of the behavior of this element in complexing aqueous media. Furthermore, the list of known compounds of Bk(III) and Bk(IV) is relatively short when compared to that of neighboring actinides. Multimilligram quantities of Bk-249 ($t_{1/2}$ = 320 days; 0.125 MeV β^- decay) were studied in aqueous carbonate and citrate solutions via absorption spectroscopy and bulk solution electrolysis. The spectra of Bk(III) in carbonate and citrate media are reported for the first time. New Bk solids have been prepared and a more complete characterization of $Bk_2(C_2O_4)_3$ has been made.

37233 **Carbonate complexation of Am(III) in aqueous solution.** Nitsche, H.; Silva, R.J. (Univ. of California, Berkeley (USA)). pp 21 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Solubility limits are being used to assess the performance of potential high-level nuclear waste repositories. Speciation and solubilities of the radionuclides are predicted by geochemical modeling. Americium is a major contributor for the radioactivity of the waste after several hundred years. Since carbonate is common to most groundwaters, reliable thermodynamic data are required as input for the models. Data exist in the literature on proposed carbonate, bicarbonate hydroxycarbonate solution species of Am^{3+}. Modeling calculations indicate that these data are not internally consistent. The Am carbonate and hydroxide systems are being investigated via absorption spectroscopy. Results will be analyzed with a modeling code to determine the relevancy of the proposed species and their formation constants.

37234 **Voltammetric investigations of the Bk(IV/III) and Ce(IV/III) redox couples in concentrated aqueous carbonate solutions.** Morris, D.E.; Hobart, D.E.; Palmer, P.D.; Haire, R.G.; Peterson, J.R. (Los Alamos National Lab., NM (USA)). pp 21 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-36;AS05-76ER04447;AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Concentrated solutions of strongly complexing anions, such as CO_3^{2-}, greatly stabilize the 4+ oxidation state of Bk and Ce. The Bk(IV/III) ($E^{0'}$ similarly ordered 0.2 V/NHE) and Ce(IV/III) (similarly ordered 0.0 V/NHE) couples in carbonate media occur in a potential region which is convenient for cyclic voltammetric investigation. A detailed investigation has been carried out for these two couples as a function of [CO_3^{2-}] (2-5 M) and pH (~ 9-14). Variations in half-wave potentials and electrochemical reversibility are observed over this range of solution conditions. Adsorptive interactions and direct electrochemical evidence for a chemical reaction accompanying reduction are also observed. These results will be discussed and a comparison between the behavior of the two couples will be drawn.

37235 **Recent studies of transplutonium compounds: new directions and use of extreme conditions.** Peterson, J.R.; Begun, G.M.; Gibson, J.K.; Haire, R.G.; Hart, R.C.; Moore, J.R.; Nave, S.E.; Payne, G.F.; Thevenin, T.L.; Wilmarth, W.R.; Young, J.P. (Univ. of Tennessee, Knoxville (USA)). pp 25 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AS05-76ER04447;AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The number of bulk-phase compounds prepared and characterized for each of the transplutonium (TPu) elements drops off precipitously with increasing atomic number. However, efforts have been made to increase the number of TPu compounds known and also the range of investigative methods applied to their characterization. The results of a worldwide survey to determine the status of the preparation of new TPu compounds and/or the application of new investigative techniques to the study of such compounds in bulk will be presented. The focus will then shift to Oak Ridge projects: extreme conditions of pressure and/or temperature are being used for synthesis and for absorption and raman spectral studies; single crystals of trihalides are being grown for spectral and magnetic studies; new ternary chalcogenide-halide compounds are being characterized; vaporization thermodynamics of TPu compounds are being determined; and attempts to stabilize unusual oxidation states are being carried out.

37236 **High-temperature vapor pressure studies of the transplutonium elements.** Haire, R.G.; Gibson, J.K. (Oak Ridge National Lab., TN (USA)). pp 25 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Measuring the enthalpy of sublimation for the actinide metals is one technique that has been used to provide information about their cohesive energy and the changing nature of the bonding in the series. These enthalpies have been acquired previously for many of the actinide elements through Es. In several cases experimental techniques had to be adjusted to cope with limited quantities of material and relatively short half-lives. They will report on recent sublimation studies that have been carried out using alloys of selected transplutonium elements through Fm and will discuss their results in conjunction with relevant information that has been reported for the actinide elements.

37237 **Effect of pressure on Am-Cm alloys.** Haire, R.G.; Dabos, S.; Benedict, U.; Dufour, C. (Oak Ridge National Lab., TN (USA)). pp 25 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

X-ray diffraction studies of the transplutonium metals under high pressure have shown that pressure can force the metal's 5f electrons to participate in bonding (become delocalized) in addition to inducing structural transformations. It has been shown that the pressures required to bring about these changes depend on the particular actinide that is being studied. They have recently studied alloys of Am and Cm under pressures up to 55 GPa in order to define their behaviors under pressure. They shall report the results of these studies and compare them with data for pure Am and Cm metals under pressure.

37238 **New ternary transplutonium compounds: chalcogenide halides.** Thevenin, T.L.; Wilmarth, W.R.; Peterson, J.R.; Haire, R.G. (Univ. of Tennessee, Knoxville (USA)). pp 26 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AS05-76ER04447;AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Although chalcogenide halides have been identified in almost all groups of the Periodic Table, they were previously unknown in the case of the actinide elements. Based on the known lanthanide chalcogenide halides, they focused their investigation on the sulfur-based compounds. Consistent with the scarcity of transplutonium elements, they developed an original microscale preparation of the ternary compounds AnSI (An = ^{242}Pu, ^{243}Am, ^{248}Cm). The reaction scheme is: An_2O_3 (or AnO_2) → $AnBr_3$ →AnI_3 → AnSI. All products are examined by X-ray powder diffraction and solid state spectroscopy.

37239 **Spectrophotometric study of thermally induced structural transformations of $CfCl_3$.** Young, J.P.; Peterson, J.R.; Haire, R.G. (Oak Ridge National Lab., TN (USA)). pp 26 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AS05-76ER04447;AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Californium trichloride is known to exist in either of two crystallographic forms, $PuBr_3$-type orthorhombic or UCl_3-type hexagonal. It has been known for some time that either form can be transformed to the other by thermal treatment. The orthorhombic form can be prepared by quenching a melted sample of $CfCl_3$. The method for complete conversion of the orthorhombic form to the hexagonal form has been less clear. They have made absorption spectral measurements of $CfCl_3$ at various temperatures and under various conditions up to and beyond its melting point, 545°C, in order to develop a set of controlled conditions for the structural transformations. The furnace for doing these studies will be described, and detailed results of the thermal study will be discussed. Possible mechanisms by which the transformations are accomplished will also be presented.

37240 **Studies of the thermal stability of americium and curium tetrafluorides.** Gibson, J.K.; Haire, R.G. (Oak Ridge National Lab., TN (USA)). pp 26 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC05-84OR21400.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The relative stabilities of an element's oxidation states in various environments are of fundamental interest. The fluorides are convenient compounds for probing the various oxidation states of the transplutonium elements and measurement of the thermal decomposition of their tetrafluorides to trifluorides provides such information. They have studied the reaction: $MF_4(s) \rightarrow MF_3(s) + 1/2\ F_2\ (g)$ for M = Am and Cm (as well as the lanthanides, Ce and Tb) by mass spectrometrically monitoring the fluorine evolution from the tetrafluorides as a function of temperature. From these measurements, the enthalpies associated with the decomposition reactions have been derived. The results of their investigations will be reported and compared with previous experimental data and predictions for the thermal behavior of these materials.

37241 **New results from nuclear studies of the heaviest actinides.** Lougheed, R.W.; Hulet, E.K.; Wild, J.F.; Moody, K.J.; Dougan, R.J. (Lawrence Livermore National Lab., CA (USA)). pp 29 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-48.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Heavy ion bombardments of ^{254}Es have produced abundant experimental results in the past several years. These results include the discovery of bimodal fission in the neutron-rich Fm and Md isotopes, the discovery of several new isotopes, improved knowledge of the decay properties of the heavy actinides, and even information on the chemical behavior of lawrencium. They will present information on the decay properties of the new isotopes ^{260}Md (31.8-d half-life), ^{261}Lr (39-m half-life) and ^{262}Lr (216-m half-life). The observed spontaneous fission activity associated with ^{262}Lr is most likely from its decay daughter, ^{262}No, which would be the first isotope with N = 160. The relatively long half-lives for these neutron-rich nuclides and their production rates from ^{254}Es targets make it possible to study their spontaneous fission properties in detail and indicate that new longer-lived isotopes may be discovered near the predicted 162 neutron shell at Z = 104 to 110.

37242 **Neutron emission from the spontaneous fission of ^{260}Md.** Wild, J.F.; Lougheed, R.W.; Moody, K.J.; Dougan, R.J.; Hulet, E.K.; Aarle, J.V.; Westmeier, W.; Brandt, R.; Patzelt, P. (Lawrence Livermore National Lab., CA (USA)). pp 30 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washihington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-48.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The authors have measured the multiplicity of prompt neutrons emitted in the bimodal spontaneous fission of 32-d Md-260. The corrected neutron distribution appears also to be bimodal, with averages of about 1.4 neutrons/fission for one group, and about 4.3 neutrons/fission for the other group, as determined by fitting Gaussian curves to the total distribution. The number of events in each neutron distribution corresponds well to the proportion of fission events previously determined for the fragment energy groups with most probable total kinetic energies (TKE) of 235 MeV and 195 MeV, respectively. This, and a rough measurement of the average TKE as a function of neutron multiplicity, supports their supposition that the high-energy events arise from a compact scission configuration of nearly spherical fragments with little deformation energy available for post-scission deexcitation.

37243 **Calculated fission properties of the heaviest elements.** Moeller, P.; Nix, J.R. (Los Alamos National Lab., NM (USA)). pp 30 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Experimental results that have been obtained over the past 15 years on fission properties of nuclei in the vicinity of ^{256}Fm show rapid variations with a change of only a few nucleon numbers. For example, the fission half-lives may change by 10 orders of magnitude, the mass division may change from asymmetric to symmetric, and the peak in the kinetic-energy distribution may shift by 40 MeV. It has been suggested that this behavior is due to the emergence of a new fission valley leading to compact scission shapes. They study the fission properties in this region by use of a macroscopic-microscopic method. They discuss some model features that are required for a quantitative calculation of the potential energy for compact scission shapes. Two such features are: (1) a shape parameterization that allows for the generation of the two-touching sphere configuration and (2) a macroscopic model that takes into account the nuclear interaction energy for shapes close to

two touching spheres. The nuclear potential energy is calculated from ground-state configurations to compact and elongated scission shapes. They present color topographical maps of the potential energy as a function of shape. The calculated maps give them a quantitative understanding of the observed fission half-lives and a qualitative understanding of the fission-fragment kinetic energies and mass distributions and their interdependence.

37244 **Cross sections for production of above target nuclides from O-18 with Bk-249.** Gannett, C.M.; Bennett, D.A.; Chadwick, R.B.; Chasteler, R.M.; Gregorich, K.E.; Hall, H.L.; Henderson, R.; Lee, D.M.; Leyba, J.; Nurmia, M.; Hoffman, D.C. (Lawrence Berkeley Lab., CA (USA)). pp 35 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC03-76SF00098.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Cross sections for production of Cf, Es, Fm and Md were measured for reactions of 102 and 109 MeV O-18 projectiles with Bk-249 targets. Yields for No and Lr were also determined at 102 MeV. The mass-yield distributions are similar in shape to those for O-18 plus Cm-249, Cf-249, Es-254, except that the He transfer have a smaller half-width. The highest yield for each type of transfer to the Bk target is greater than that for the other targets. Also, the yields for H and He transfers to the Bk target differ by an order of magnitude while they are nearly the same for the other targets.

37245 **β-delayed fission from ^{256}Es and the level scheme of ^{256}FM.** Hall, H.L.; Henderson, R.A.; Gregorich, K.E.; Hoffman, D.C.; Lee, D.M.; Wilhelmy, J.B.; Bunker, M.E.; Starner, J.W.; Fowler, M.M. (Lawrence Berkeley Lab., CA (USA)). pp 36 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

A 0.1 μg target of ^{254}Es was bombarded with tritium, forming /sup 256m/Es by the (t,p) reaction. The reaction products were separated radiochemically, and then the β-decay of /sup 256m/Es to levels about 1.5 MeV above the ground state in the daughter ^{256}Fm and subsequent γ-decays were followed using correlation techniques. From these measurements, they are able to present a more complete level scheme for ^{256}Fm, as well as report that two delayed-fission events were observed. A B-delayed fission probability of 2×10^{-5} relative to total decay was obtained, and the fission half-life of the excited state was determined to be 0.8 ms with a 95% confidence level range of 0.11 ms to 9.6 ms.

37246 **(CONF-860804—15) Numerical simulation of flame propagation in constant volume chambers.** Ghoniem, A.F.; Knio, O.M. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Mechanical Engineering). Jul 1986. Contract AC04-81AL16310. 23p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009466/JAW.

From 21. international symposium on combustion; Munich, F.R. Germany (3 Aug 1986).

Combustion of premixed gases inside a closed chamber is computed using a thin flame model at high Damkohler number. The burning velocity is taken as a function of the thermodynamics of the reacting mixture and the flame front curvature. Gas motion due to expansion across the flame is computed assuming an inviscid flow at low Mach number. Results show that the flame is unstable, developing wrinkles which grow into deep indentation along the front. A stabilizing mechanism associated with curvature damps small scales and moderates the rate of growth of perturbations. However, long wavelength perturbations survive and affect the later stages of burning. Numerical results are compared with experimental data on flame propagation in a quiescent mixture inside a circular chamber, initiated by central or side ignition sources. Using recent measurement of the Markstein length, good agreement is obtained for the first case. Some deviation is seen in the second case due to heat losses when the flame propagates close to the chamber walls. The model is applied to study the effect of swirl on the rate of burning and pressure rise. 22 refs., 6 figs.

37247 **(CONF-860808—16) Explosions of adiabatically compressed gases in a constant volume bomb.** Keck, J.C.; Hu, H. (Massachusetts Inst. of Tech., Cambridge (USA)). Aug 1986. Contract AC04-81AL16310. 26p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009465/JAW.

From 7. international congress on photosynthesis; Providence, RI, USA (10 Aug 1986).

Measurements of the explosion limits for fuel-air mixtures compressed by an expanding laminar flame front have been made in a constant volume bomb. The mixtures studied to date include normal pentane, hexane and heptane with fuel-air equivalence ratios in the range 0.8 to 1.3. An Arrhenius plot of the explosion density as a function of reciprocal temperature in the range 670 to 720{degree}K is consistent with an activation energy of 51 kcal/mole. For fixed initial temperature and pressure, the explosion density has weak minimum at an equivalence ratio near {phi}=1.1 and decreases with increasing chain length. This behavior is in good agreement with observations made in rapid compression machines and spark ignition engines. A simple kinetic model based on a branched chain mechanism has been developed to correlate the data. In the first stage region the equations are linear and can be integrated approximately using the WKB method. The resulting expression gives an explicit connection between the explosion limit for gases undergoing adiabatic compression and the first stage induction time at constant density. Quantitative agreement between theory and experiment can be achieved with minor modifications in values of published rate constants. 29 refs., 7 figs., 1 tab.

37248 **(DOE/ER/10677—8) Diffusion flame studies of the chemical and physical mechanisms of soot formation from aromatic and substituted aromatic fuels: Final report for the period February 16, 1984-February 15, 1988.** Merklin, J.F.; Sorensen, C.M. (Kansas State Univ., Manhattan (USA)). Mar 1988. 52p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008231/JAW.

Benzene was found to be the first product formed in the shock-tube pyrolysis of toluene in the temperature range from 1100 to 1700{degree}K. The yield of benzene peaked at 1425{degree}K. The production of benzene, acetylene and methane were modelled by a set of nine chemical reactions, using rate constants reported in the literature. Benzene was shock-heated in the temperature range from 1100 to 1700{degree}K and biphenyl, phenanthrene, pyrene and p-terphenyl were detected with the liner residue method. This is the first time these species have been observed in shock-tube pyrolysis. These results suggest that in the initial stages of soot formation phenyl rings and acetylenic fragments are required. From the chemical probing of a sooting pre-mixed methane oxygen, it is shown that the growth of soot particles is largely due to surface addition of acetylenic fragments. Premixed methane/oxygen flames and benzene-doped methane/oxygen flames were optically probed to determine the soot volume fraction and the soot particle size. The maximum flame temperature and C/O were held constant. As the benzene concentration was increased, the soot volume fraction increased at early times in the flames. However, the ultimate soot volume fraction was unaffected by the substitution of benzene for methane. 21 refs., 21 figs., 6 tabs.

37249 **(DOE/ER/13269—T3) A program to study CH reactions relevant to combustion/gasification processes: Final report, July 1986-July 1987.** Anderson, S.M.; Freedman, A.; Kolb, C.E. (Aerodyne Research, Inc., Billerica, MA (USA). Center for Chemical and Environmental Physics). Jan 1988. Contract FG02-84ER13269. 24p. (ARI-RR—619). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008095/JAW.

In the first year of our present program, we investigated a chemical CW source of carbyne radicals suitable for kinetic studies

in fast-flow reactors. The approach used alkali metal atoms (M = Na or K) to successively abstract halogen (X = Br or C{ell}) atoms from a haloform molecule, producing the CH radical and three alkali halide molecules. Early in the second year, attempts to observe CH reacting with O_2, H_2, and N_2 produced mixed results, suggesting that better separation between CH production and reaction zones was necessary. A pre-reactor assembly that permits variation of nearly all source parameters independent of main reactor conditions was constructed. The third year of the program yielded high-quality kinetic data for five CH reactions (CH + Cl_2, N_2O, CH_4, O_2, and H_2), and preliminary results for three others (D_2, NO and N_2) at 2 Torr and 290{degree}K. This was the first study of the CH + Cl_2 reaction. In addition, we made preliminary observations of significant OH production from both the CH + O_2 and NO reactions. Initial attempts to operate at higher temperatures (up to 1100 K) revealed a needed design change in the source. Plans for the fourth year of this effort include completing a study of CH + N_2, H_2 and CO reaction kinetics, as a function of temperature, determining the OH yields for CH + O_2 and NO, and investigating mechanistically related reactions, such as $^{13}CH + {}^{13}CO \rightarrow {}^{13}CH + {}^{13}CO$. 20 refs., 8 figs.

37250 (DOE/ER/13282—5) Aromatics oxidation and soot formation in flames: Progress report for year beginning 15 August 1987. Howard, J.B. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Chemical Engineering). 1987. Contract FG02-84ER13282. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010960/JAW.

Work during this period has been concerned with further analysis of the high molecular weight compounds found in the soot inception zone of flames and assessment of the role these species may play in the nucleation of nascent soot particles. The number concentration of these species had been found to exhibit a maximum near the zone of soot nucleation. The extent to which the mass concentration of these heavy species changes during soot inception had not been established beyond doubt, and the possible conversion of mass from heavy molecules to nascent soot particles, including the presumed competition between destruction and growth, required clarification. To these ends, probe samples were collected and analyzed and the data were interpreted. 6 refs., 3 figs., 1 tab.

37251 (SAND—88-0553C) Development of an experimental system for studying fast transient ignition phenomena. Skocypec, R.D.; Erickson, K.L. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-880750—11). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011917/JAW.

From 13. international pyrotechnics seminar; Grand Junction, CO, USA (11 Jul 1988).

This paper describes work in progress to develop an experimental system for studying fast transient ignition phenomena. The system integrates several diagnostic techniques to study the fast transient reaction kinetics (~ 10 μs temporal resolution) governing the thermal ignition of pyrotechnics and explosives. The principal components of the system include: (1) a time-of-flight (TOF) mass spectrometer and a quadrupole mass spectrometer, (2) a photo-elastic modulator (PEM) ellipsometer, (3) a pulsed dye laser and a continuous wave ND:YAG laser, (4) an infrared detector array, (5) ultra-high vacuum systems, and (6) a high-speed, computer-based data acquisition system. The basic experimental concept is to react samples having a simple, known geometry for which complex heat and mass transfer effects are minimized so that reaction mechanisms and rates can be examined directly.

37252 (SAND—88-8217) Summary of discussions at the tenth meeting of the Sandia Cooperative Group on the Aerothermochemistry of Turbulent Combustion. Dibble, R.W.; Lucht, R.P. (Sandia National Labs., Livermore, CA (USA)). Mar 1988. Contract AC04-76DR00789. 26p. (CONF-8710304—Summs.). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008467/JAW.

From 10. meeting of the Sandia cooperative group on the aerothermochemistry of turbulent combustion; Warren, MI, USA (12 Oct 1987).

A turbulent reacting flow working group has been established through the sponsorship of the Department of Energy, Office of Basic Energy Sciences, Division of Chemical Sciences. Purpose of this group is to establish and maintain a strong interaction and active dialogue between workers currently involved in modeling turbulent reacting flows and those involved in related experiments. One objective of this collaboration is to develop an increased understanding of the fundamental interaction between the chemical and fluid dynamical processes occurring in chemically reacting flows and to utilize this understanding to improve predictive capabilities for turbulent combustion. Regular members, who represent academia, private industry, and national laboratories, and guests participate in the meetings. Several guests are invited to each meeting to provide an influx of different ideas and opinions to the discussions. This document is a summary of the discussions that took place during the tenth meeting, which was held at General Motors Research Laboratories, Warren, Michigan, October 12-13, 1987.

37253 (STEV-FBT—87-34) Practical and theoretical study of sintering of coal ash and limestone in a fluidized bed combustor. Steenari, B.M. (Statens Energiverk, Stockholm (Sweden)). 1987. 24p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752950/JAW.

Conditions critical for sintering of the bed material in FBC boilers were investigated experimentally and theoretically. Potassium lowers the melting temperature in the $CaO-SiO_2-Al_2O_3$ system. This is especially important when fuels rich in alkalies like wood are used. Another critical situation is when reducing conditions are used in the bed. $CaSO_4$ is then reduced to CaS and the resultant sulfate - sulfide mixture has an eutectic region at 830 - 1200 degrees C depending on which other elements are present. Initial results from calculations using a thermodynamic model on the system $CaO-SiO_2-Al_2O_3-K_2O$ are also reported. The liquidus temperatures obtained from such calculations do not agree very well with experimental ones. However, relative trends like the effect of additives on a specific ash composition may be evaluated by the thermodynamic model.

37254 (STEV-FBT—87-35) Theoretical studies of processes essential for sintering and slagging in combustion plants. Progress report 1. $Al_2O_3-CaO-K_2O-SiO_2$ system. Idrestedt, I.; Lindqvist, O.; Steenari, B.M. (Statens Energiverk, Stockholm (Sweden)). Jan 1987. 56p. (In Swedish). (CTH-OOK—87-01). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752951/JAW.

The report includes a literature survey and a description of experimental methods for the determination of thermodynamic data and phase diagrams. A number of theoretical models for the calculation of phase diagrams and activity data are presented. Some preliminary tests of computerized models have been performed. 56 refs. (G.B.).

37255 (STEV-FBT—87-38) Temperature measurement on the surface of the particle. Gromulski, J. (Statens Energiverk, Stockholm (Sweden); Studsvik Energiteknik AB, Nykoeping (Sweden)). Feb 1987. 21p. (In Swedish). (STUDSVIK-EP—87-10). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752952/JAW.

This report describes the experiments carried out in a drop tube furnace with a Polish coal, with the aim of measuring the surface temperature of individual fuel particles. A two wave pyrometer with a response time of 8 msec was used to measure the temperatures. This technique was compared with conventional methods such as thermocouple, suction pyrometer and hot wire anemometer. The results obtained show that the particle temperature is greater than the gas temperature. The measured values agreed quantitatively with those theoretically calculated from a simple mathematical model based on the combustion of a fraction of the particles. The instrument can be used over a wide range, from the particle concentrations existing in the drop tube furnace to those conditions found in real pulverized flames.

37256 (UCRL—98402) The oxidation of N-butane at low and intermediate temperatures: An experimental and modeling study. Pitz, W.J.; Wilk, R.D.; Westbrook, C.K.; Cernansky, N.P. (Lawrence Livermore National Lab., CA (USA); Drexel Univ., Philadelphia, PA (USA). Dept. of Mechanical Engineering and Mechanics). 10 Mar 1988. Contract W-7405-ENG-48. 38p. (CONF-880373—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008039/JAW.

From Western States Section/The Combustion Institute spring meeting; Salt Lake City, UT, USA (21 Mar 1988).

An experimental and modeling study of n-butane oxidation in a static reactor was conducted at temperatures encompassing the negative temperature coefficient region and portions of the low and intermediate temperature regimes. The numerical model employed a detailed chemical kinetic mechanism for n-butane oxidation. Conditions considered in the combined study were temperatures in the range of 554-737 K, an initial pressure of 550 torr, and a molar mixture ratio of 1:20:20.33 n-butane:O_2:N_2. The induction period and stable species concentrations were measured and comapred to modeling predictions. The variation in induction period over the region of negative temperature coefficient is well-predicted by the model. The model is also used to analyze the static reactor data of Baker who investigated n-butane$H_2O_2N_2$ mixtures. The agreement between their detailed species concentration measurements and the modeling predictions is good. Modeling calculations identified some of the key reactions at the conditions investigated. Internal H-atom abstractions of the butyl peroxy radicals and subsequent reactions contributed significantly to the major intermediate species that were observed and to the production of reactive OH radicals. Additionally, radical-radical reactions involving the HO_2 radical consumed a significant amount of butyl peroxy radicals and accelerated the overall rate of oxidation. 53 refs., 5 figs., 1 tab.

37257 Calculation of saturation line shapes and intensities in coherent anti-Stokes Raman scattering spectra of nitrogen. Lucht, R.P.; Farrow, R.L. (Combustion Research Facility, Sandia National Laboratories, Livermore, California 94550). *Journal of the Optical Society of America B: Optical Physics;* 5: No. 6, 1243-1252(Jun 1988).

Line shapes and intensities for coherent anti-Stokes Raman scattering (CARS) at saturation laser intensities are determined for nitrogen vibrational Q-branch lines by solving the time-dependent density-matrix equations numerically. We have previously performed measurements of saturated CARS line shapes in pure nitrogen by using nearly Fourier-transform-limited pump and Stokes lasers. The experimental laser pulse shapes, Stark effects, Doppler broadening, and the nonresonant background are incorporated in the numerical calculations. The numerical results show good agreement with the high-resolution measurements of saturated CARS line shapes. The lines show prominent saturation dips, and agreement between theory and experiment is excellent in terms of the depth and the width of the dips. The numerical results indicate that the Doppler effect tends to broaden and to deepen the dip in highly saturated lines, an effect that cannot be explained by a steady-state theory.

37258 Factors affecting gas-phase continuous wave infrared laser sensitized pyrolysis. Zhu, J.; Yeung, E.S. (Iowa State Univ., Ames (USA)). *Journal of Physical Chemistry;* 92: No. 8, 2184-2188(21 Apr 1988). Contract W-7405-ENG-82.

A model is developed for predicting temperature profiles in a gas cell containing an absorbing gas when irradiated by a CW laser beam with well-defined parameters. The model takes into account the explicit temperature dependence of heat capacities, thermal conductivities, molar absorptivities, and gas densities. The predicted transmittance of the laser beam as a function of incident power agrees with experimental values. The model is further used to predict rate parameters of a standard homogeneous pyrolysis reaction that is sensitized by the heated gas. The results provide insight into the comparison between the traditional thermal processes and CW laser sensitized pyrolysis.

37259 Chemical Kinetic Data Base for Combustion Chemistry. Part 3: Propane. Wing Tsang. (Chemical Kinetics Division, National Bureau of Standards, Gaithersburg, Maryland 20899). *Journal of Physical and Chemical Reference Data;* 17: No. 2, 887-951(Apr 1988).

This publication contains evaluated and estimated data on the kinetics of reactions involving propane, isopropyl radical, n-propyl radical, and various small inorganic and organic species which are of importance for proper understanding of propane pyrolysis and combustion. It is meant to be used in conjunction with the kinetic data given in earlier publications which are of direct pertinence to the understanding of methane pyrolysis and combustion, but which also contain a large volume of data that are applicable to the propane system. The temperature range covered is 300—2500 K and the density range 1 x 10^{16} to 1 x 10^{21} molecules cm^{-3}.

37260 (GEPP-TIS—366e) A bibliography and author index for electrical discharges in vacuum (1897-1986). Miller, H.C. (General Electric Co., Largo, FL (USA). Neutron Devices Dept.). Mar 1988. Contract AC04-76DP00656. 395p. NTIS, PC A17/MF A01;1; GPO Dep. Order Number DE88008744/JAW.

This bibliography covers the field of electrical discharges in vacuum, comprising both electrical breakdown in vacuum and vacuum arcs. A brief reference review section lists some papers which would be helpful to the novice in this field. The bulk of this paper consists of bioliographic listings, arranged by year of publication and alphatectically by first author within each year. An author index refers one to all papers authored or coauthored by a particular person. There are 3483 papers listed through December 1986.

37261 (AD-A—190449/9/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 9. Appendices F-K. Final report, September 1985-September 1986. (Radian Corp., Austin, TX (USA)). Dec 1987. 371p. NTIS, PC A16/MF A01.

Includes envelope with map. See also Volume 10, AD-A190 450.

This report discusses analytical data concerning water quality and environmental protection. This report was prepared for the United States Air Force by Radian Corporation, for the purpose of aiding in the implementation of the Air Force Installation Restoration Program.

37262 (AD-A—190661/9/XAB) Technique for code augmentation. Memorandum report. Fickie, K.D.; Grosh, J. (Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab.). Oct 1987. 40p. (BRL-MR—3622). NTIS, PC A03/MF A01.

A simple method for calling pre-existing computer codes from inside another program is described. Three applications drawn from the field of interior ballistics are included as examples. Two of the cases are optimization problems and the other is a simple search for a constraint condition. More elaborate applications in the area of computer-aided design are discussed.

37263 (AD-A—190666/8/XAB) Superconducting phase shifter in the development of a Terahertz Imaging Radar System. Final technical report, August 1985-January 1987. Baliga, S.; Radparvar, M.; Faris, S.M. (Hypress, Inc., Elmsford, NY (USA)). Oct 1987. 44p. NTIS, PC A03/MF A01.

A Terahertz Imaging Radar System which exploits superconductive electronics for all of its major components is described in this report. In particular, the importance of the superconducting millimeter(mm)-wave phase shifter in the development of such systems was fully investigated. The experimental and theoretical re-

sults presented are better than the authors expected to achieve under Phase I of the project. Conventional technology is unable to provide the high frequencies required to obtain small apertures for target acquisition. Superconducting technology offers a high-performance, very broadband and low-power, mm- and sub-mm wave phase shifter based on superconducting microstrips. The physics of the non-equilibrium superconductivity underlying the operation of the superconducting microstrip phase shifter has been studied. Theoretical analysis and numerous experimental results show that superconducting stripline modulation leading to phase velocity reduction and subsequent phase shift is achievable by quasi-particle injection. A digital N-bit phase shifter based on the superconducting microstrip transmission line is proposed for development. The implementations of such a mm and sub-mm wave phase shifter will fulfill a crucial need in the development of the Terahertz Imaging Radar.

37264 **(AD-A—190701/3/XAB) Composite-ceramic superconducting filaments for superconducting cable. Interim progress report, 16 October-15 December 1987.** Halloran, J.W. (Ceramics Process Systems Corp., Cambridge, MA (USA)). 5 Jan 1987. 94p. NTIS, PC A05/MF A01.

This is the second progress report of a five-month program to demonstrate the feasibility of manufacturing superconducting wires from $YBa_2Cu_3O_{7-x}$, consisting of a small ceramic core with a copper cladding. The ceramic core is to be produced from a dry-spun ceramic fiber, sintered to create a <010> fiber texture to enhance critical current. The sintered fiber is to be clad with copper by electroplating. The sintering and microstructure development of $YBa_2Cu_3O_{7-x}$ was characterized for as-calcined and milled powder, both as undoped and doped with 5wt% CuO. The undoped powder reaches 94% density, with fully recrystallized grains after 15 hours at 955 C. The CuO doped material sinters to full density at temperatures as low as 925 C, with extensive recrystallization. The resistivity was measured as a function of temperature for nearly dense and relatively porous undoped material.

37265 **(AD-A—190767/4/XAB) Potential field-expedient test for face mask integrity. Technical report, June-August 1986.** Krishnan, P.N.; Birenzvige, A.; Poziomek, E.J. (Chemical Research, Development and Engineering Center, Aberdeen Proving Ground, MD (USA)). Oct 1987. 26p. (CRDEC-TR—88012). NTIS, PC A03/MF A01.

In the battlefield situation, soldiers must don their protective masks when a chemical or biological threat is suspected (Figure 1). Once the soldier had donned his mask, proper fit is essential for maximum respiratory, eye, and skin protection in contaminated environments. Therefore, the assurance of proper fit after mask donning is of primary importance. In the laboratory evaluation of the protective masks, the leakage of a challenged aerosol is quantitatively measured using very-sensitive detection instrumentation. A study was conducted to determine the feasibility of developing a field-expedient method to test the integrity of a face mask. Cursory observation indicates that tobacco smoke odor can provide a protection factor on the order of 3000 which represents a potentially significant improvement over the protection factor provided by isoamyl acetate (banana oil), which is of the order 500 or less.

37266 **(CEA-CONF—9262) Non linear structures seismic analysis by modal synthesis.** Aita, S.; Brochard, D.; Guilbaud, D.; Gibert, R.J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 13p. (In French). (CONF-8711193—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753468/JAW.

From Symposium on non linear behaviour of reinforced concrete submitted to a seismic excitation; Saint-Remy-Les-Chevreuse, France (25 Nov 1987).

The structures submitted to a seismic excitation, may present a great amplitude response which induces a non linear behaviour. These non linearities have an important influence on the response of the structure. Even in this case (local shocks) the modal synthesis method remains attractive. In this paper we will present the way of taking into account, a local non linearity (shock between structures) in the seismic response of structures, by using the modal synthesis method.

37267 **(CONF-880466—1) Application of superconducting technology to earth-to-orbit electromagnetic launch systems.** Hull, J.R.; Carney, L.M. (Argonne National Lab., IL (USA); National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1988. Contract W-31109-ENG-38. 15p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009955/JAW.

From Conference on superconductivity and applications; Buffalo, NY, USA (18 Apr 1988).

Benefits may occur by incorporating superconductors, both existing and those currently under development, in one or more parts of a large-scale electromagnetic launch (EML) system that is capable of delivering payloads from the surface of the Earth to space. The use of superconductors for many of the EML components results in lower system losses; consequently, reductions in the size and number of energy storage devices are possible. Applied high-temperature superconductivity may eventually enable novel design concepts for energy distribtion and switching. All of these technical improvements have the potential to reduce system complexity and lower payload launch costs. 10 refs.

37268 **(CONF-880466—5) Use of high temperature superconductors in magnetoplasmadynamic systems.** Reed, C.B.; Sovey, J.S. (Argonne National Lab., IL (USA); National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center). 1988. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011954/JAW.

From Conference on superconductivity and applications; Buffalo, NY, USA (18 Apr 1988).

The use of Tesla-class high-temperature superconducting magnets may have an extremely large impact on critical development issues (erosion, heat transfer, and performance) related to MPD thrusters and also may provide significant benefits in reducing the mass of magnetics used in the power processing system. These potential performance improvements, coupled with additional benefits of high-temperature superconductivity, provide a very strong motivation to develop high-temperature superconductivity (HTS) applied-field magnetoplasmadynamic (MPD) thruster propulsion systems. The application of HTS to MPD thruster propulsion systems may produce an enabling technology for these electric propulsion systems. This paper summarizes the impact that HTS may have upon MPD propulsion systems.

37269 **(CONF-880478—13) Application of superconducting technology to earth-to-orbit electromagnetic launch systems.** Carney, L.M. (Argonne National Lab., IL (USA)). 28 Jun 1988. Contract W-31109-ENG-38. 29p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010022/JAW.

From 4. symposium on electromagnetic launch technology; Austin, TX, USA (12 Apr 1988).

This paper explores the potential benefits that may occur as a result of incorporating superconductors, both existing and those currently under development, in one or more parts of a large-scale electromagnetic launch system that is capable of delivering payloads from the earth's or lunar surface to space. Analysis indicates that superconducting components result in significant cost reductions for both rail and coaxial accelerator designs. 25 refs., 1 fig., 1 tab.

37270 **(CONF-880721—1) Optimization of performance criteria with bounded joint velocities for robots with one degree of redundancy.** Dubey, R.V.; Euler, J.A.; Babcock, S.M. (Tennessee Univ., Knoxville (USA). Dept. of Mechanical and Aerospace Engineering; Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 9p. (CESAR—87/41). NTIS, PC A03;3. Order Number DE88003915/JAW.

From USA-Japan symposium on flexible automation; Minneapolis, MN, USA (18 Jul 1988).

Most kinematic control schemes for robots with redundant joints determine the joint motions for a desired end-effector trajectory such that a performance criterion is optimized. When the robot is in motion, it may reach a configuration in which the joint velocities required to optimize a performance criterion, while following a desired end-effector trajectory, may be extremely high.

This problem is referred to as an algorithmic singularity. The control scheme presented in this paper avoids high joint velocities by compromising optimization of the performance criterion in the neighborhood of an algorithmic singularity. This scheme does not require the pseudoinverse of the Jacobian and thus, it is computationally efficient and well suited for real-time implementation. Unlike other control schemes, the robot is not required to be an optimum configuration at the starting point. The application of this scheme to a seven-degree-of-freedom manipulator at the Center for Engineering Systems Advanced Research (CESAR) is described. 11 refs., 6 figs., 1 tab.

37271 (CONF-880741—2) Vibrational impacts of hush house operation. Witten, A.J. (Oak Ridge National Lab., TN (USA). Energy Div.). 1988. Contract AC05-84OR21400. 13p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006983/JAW.

From Joint CSCE-ASCE conference on environmental engineering; Vancouver, Canada (13 Jul 1988).

United States Air Force (USAF) facilities are required to test turboprop and turbojet engines before or after maintenance or repair and prior to installation on aircraft to ensure that no problems were introduced or remain uncorrected. This requirement prevents the installation of engines in aircraft which require further maintenance. There are a number of facilities in use by USAF for conducting engine diagnostic tests. The most modern of these facilities is the hush house which is a hangar-like structure designed to isolate the noise associated with extended engine operations from the surrounding environment. One type of hush house, the T-10, is of particular concern because of vibrational impacts to surrounding structures induced by subaudible sound (infrasound) emitted during operation. While these facilities fulfill the design requirement of reducing audible noise, serious siting problems have been reported at several installations because of infrasound-induced vibrations. The worst of these include the abandonment of an avionics laboratory because induced vibrations interfered with this facilities function and structural damage to a concrete block maintenance facility. This paper describes a predictive method for assessing vibration-driven structural impacts. 9 refs., 2 figs.

37272 (CONF-8609418—) Proceedings of the meeting on construction foundations in Nuremberg 1986. (Deutsche Gesellschaft fuer Erd- und Grundbau e.V., Essen (Germany, F.R.)). 1986. 591p. (In German). NTIS (US Sales Only), PC A25/MF A01. Order Number DE88770213/JAW.

From Meeting and technical exhibition on construction foundations; Nuernberg, F.R. Germany (22 Sep 1986).

The main topics of the meeting were: The insulation of reservoir and disposal facilities, special problems at dams and embankments and new developments and experiences in underground engineering. Five papers from 32 were abstracted for the ENERGY database.

37273 (CONF-8805106—1) Stability control of leakage flow channels. Mulcahy, T.M.; Grotberg, J.B.; Prince, A.; Reiss, E.L. (Argonne National Lab., IL (USA); Northwestern Univ., Evanston, IL (USA). Dept. of Engineering Science and Applied Mathematics). 1988. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009995/JAW.

From 6. symposium on energy science; Argonne, IL, USA (4 May 1988).

Conditions for self-excited vibrations of channels conveying leakage flows are identified, including experimental results for an unconstricted slip joint. Several simple mathematical models of the interaction of the elastic channels and the flow are described, which should be useful for the identification and control of the structural instabilities. 12 refs., 5 figs.

37274 (DOE/ER—13598-2) A program to develop the engineering information necessary for the design of a cylindrical film reactor: Progress report. (Westinghouse Electric Corp., Pittsburgh, PA (USA)). [1988]. Contract FG02-86ER13598. 10p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009885/JAW.

The second year of a proposed three-year research program (performed in conjunction with Carnegie-Mellon University) to study the "cylindrical film" chemical reactor has concentrated on determination of gas flow rates and nozzle injection procedures within the cylindrical film volume which allows stable operation of the reactor. Our studies have concentrated primarily upon determination of the amounts of air which can be injected into various nozzle configurations at differing flow rates. "Stability plots" have been made for six different nozzles: five and ten centimeter diameter annuli with gap spacing of 0.5, 1, and 2 millimeters. Only a relatively narrow band of stable configurations exist.

37275 (DOE/ER/13306—10) Model uncertainty, process design, and process control. Skogestad, S.; Morari, M. (California Inst. of Tech., Pasadena (USA)). 1985. Contract FG03-85ER13306. 42p. (CONF-851123—13). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012172/JAW.

From American Institute of Chemical Engineers annual winter meeting; Chicago, IL, USA (10 Nov 1985).

It has been shown previouly that the quality of control achievable for a certain system (its dynamic resilience) is limited by the nonminimum phase characteristics of the plant, constraints on the manipulated variables and model uncertainty. Model uncertainty requires the controller to be detuned and performance to be sacrificed. The goal of this paper is to quantify this well known qualitative statement. A general discussion of the model uncertainty problem is followed by the derivation of simple bounds on the nominal performance imposed by the robust stability condition for some uncertainty descriptions. These bounds are relatively easy to evaluate and should be effective tools for screening alternate designs in terms of their resilience characteristics. It is shown that the use of the minimized condition number as a sensitivity measure implicity assumes that the relative errors of the transfer matrix elements are independent and have similar magnitude bounds.

37276 (DOE/NV/10322—32) Use of finite element methods in the design of drilling related equipment at the Nevada Test Site. (Fenix and Scisson, Inc., Mercury, NV (USA)). May 1988. Contract AC08-84NV10322. 23p. (CONF-8805108—1). NTIS, PC A03;3. Order Number DE88008670/JAW.

From Institute of shaft drilling technology annual conference; Las Vegas, NV, USA (11 May 1988).

Finite Element Analysis is being used successfully at the Nevada Test Site in the design of new large diameter drilling equipment. It is also used in design modifications to existing equipment. This paper presents the following three design problems solved by using Finite Element Methods: Fillet weld design for stiffener ring to large diameter casing; subbase design for 1,400,000 lb. load; and pipe gripper stress analysis for automatic pipe handler. 14 figs., 3 tabs.

37277 (DP-MS—88-19) Efficient and safe hot air heating of size 5A/B UF_6 cylinders. Binstock, G.B. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Plant). 1988. Contract AC09-76SR00001. 5p. (CONF-880558—7). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009011/JAW.

From Uranium hexafluoride--safe handling, processing, and transporting conference; Oak Ridge, TN, USA (24 May 1988).

An efficient and safe means for unloading size 5 VHE uranium hexafluoride (UF_6) cylinders using hot air has been developed and tested at the Savannah River Plant (SRP). Hot air impinges directly on the cylinder through hundreds of small holes close to the cylinder surface. A cylinder of UF_6 can be unloaded in about 10 hours at an air temperature of 100{degree}C. The forced convection heating system replaced a natural convection heater in which the UF_6 cylinder was placed in the center of an electrical resistance-heated 6-in. pipe. A comparison of the two types of he using forced convection is 11.5 Btu/(hr)(ft²)({degree}F) as compared to 3.9 Btu/(hr)(ft²)({degree}F) for the natural convection heater. The measured heat transfer coefficient for the forced convection heater is compared to correlations. Hot air heating also provides improved cylinder heating safety by increasing the unloading rates while operating at a low cylinder temperature, providing a large margin of safety against a hydraulic cylinder rupture. Administrative and en-

gineered safety features to prevent high cylinder pressures and UF_6 leaks are discussed. 1 ref., 3 figs., 1 tab.

37278 (DPST—86-340) Analysis of DWPF sample station experimental design. Postles, R.L. (Savannah River Lab., Aiken, SC (USA)). 20 Mar 1986. Contract AC09-76SR00001. 49p. NTIS, PC A03;3. Order Number DE88009573/JAW.

Data in this document were derived from observations from the Slurry Receipt & Adjustment Tank (SRAT) and Slurry Mix Evaporator (SME). The Standard dip-tube sampler produced samples from the 79in., 94 in., and 169 in. levels; while the Prototype sampler obtained samples very near the tank bottom. Replicate Samples were gathered at each level and replicate Analyses made on each. The Analysis is Weight % Solids obtained through use of a microwave drying procedure. The issue of whether or not the tank contents are homogeneous devolves into whether there are detectable differences between levels. Comparison of the 3 levels within the Standard sampler gives the cleanest contrast, in that it is unconfounded with Prototype-to-Standard effects. The Prototype does provide a 4th level, but at the cost of inflating the Level-to-Level contrast with whatever Prototype-to-Standard differences exist. Hence, Level-to-Level differences were computed within the Standard sampler.

37279 (FMPC—2137) Safety analysis report for packaging DOT [Department of Transportation] specification 17H (30 and 55 gallon) and 17C (55 gallon) steel drums for slightly enriched uranium metal and uranium residues. (Westinghouse Materials Co. of Ohio, Cincinnati (USA). Feed Materials Production Center). 13 May 1988. Contract AC05-86OR21600. 217p. NTIS, PC A10;3. Order Number DE88011285/JAW.

An analytical evaluation of the DOT 17C and 17H steel Drums has been made to demonstrate its compliance with regulations governing the offsite shipment of radioactive materials. The evaluation encompasses four primary categories: structural integrity, thermal integrity, nuclear criticality safety and quality assurance. The results of this evaluation show that the drums comply with the regulations, for the shipment of various uranium metal shapes and residue enriched up to 1.25 wt.% ^{235}U. 23 refs., 24 figs., 11 tabs.

37280 (FNAL-TM—1514) Argon spill test for E706. Kilmer, J. (Fermi National Accelerator Lab., Batavia, IL (USA)). 17 Mar 1988. Contract AC02-76CH03000. 12p. NTIS, PC A03;3. Order Number DE88010654/JAW.

There were three different tests involved in this series. It should be stated that the purpose of the test was to determine if there should be extra precautions taken with the calorimeter vent stack. No attempt was made to do quantitative measurements. The three types of tests were diffusion tests, spills at a remote site, and a spill at the MW building. Oxygen monitors used were the standard Energy Saver type throughout. 6 figs.

37281 (Juel-Spez—411) Data acquisition and control of the 370 TBq high-pressure tritium doping device, TRIBA. Pfeil, A.; Heer, H.; Laesser, R.; Klatt, K.H. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentrallabor fuer Elektronik; Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Festkoerperforschung). Jul 1987. 73p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753575/JAW.

The report is arranged as follows: After an introduction, the first section briefly discusses measured values obtained with the 37 TBq (10^3 Ci) doping device with a view to the enhanced measuring range that is achievable with the newly developed 370 TBq (10^4 Ci) device. Sections 3 and 4 explain the technical design of the device and the measuring and control equipment connected to the computer. All following sections are detailed descriptions of the computer configuration and the software.

37282 (K/ETAC—57) Verification of the ADINA finite element code for creep analysis: problems from the open literature. McGrath, S.V.; Faulkner, M.A.; Bass, B.R.; Johnson, W.G. (Oak Ridge National Lab., TN (USA)). Mar 1988. Contract AC05-84OT21400. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011826/JAW.

This report presents the ADINA finite element analysis of several sample creep problems taken from the open literature. In addition to creep, the nonlinearities of plasticity and geometric stiffness are addressed.

37283 (K/ETAC—64) Naval underwater systems center torpedo data acquisition system: Wet system conceptual design report. Adams, D.J.; Beshears, D.L.; Capps, G.J.; Jordan, J.K.; Ott, G.W.; Scudiere, M.B.; White, C.P.; Nodine, R.N.; Todd, R.A. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OT21400. 59p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010155/JAW.

In the process of developing technology for torpedo applications, Naval test vehicles are instrumented with sensors (and signal processors), and their outputs are recorded during in-water exercises. This paper defines the coneptual design for a state-of-the-art on-board torpedo digital data acquisition system which will be used to monitor and record an enormous volume of data from transducer signals during either routine or development in-water exercises.

37284 (K/QT—198) OOO stage equipment bearing performance with a lower viscosity lubricant. Lannom, D.C. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OT21400. 34p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011827/JAW.

One of the Gaseous Diffusion Ultimate Potential (GDUP) projects involves a study of methods to reduce process equipment bearing power losses. In support of this effort, an analytical study has been completed which assesses the performance and expected benefits of operating the 000 stage equipment with a lower viscosity lubricant. Fluid film bearing analysis codes were employed to study 000 stage compressor and motor bearings. Correlations depicting bearing minimum film thickness and power loss with variable lubricant inlet temperature are presented for two lubricants: (1) code BG oil (310 SSU at. 100 F) and code BE oil (150 SSU at. 100 F).

37285 (K/QT—201) Thermal properties evaluation of UF_6 cylinder overpack insulation. Frazier, J.L. (Oak Ridge Gaseous Diffusion Plant, TN (USA)). 1988. Contract AC05-84OT21400. 2p. (CONF-880558—6). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009485/JAW.

From Uranium hexafluoride--safe handling, processing, and transporting conference; Oak Ridge, TN, USA (24 May 1988).

A phenolic foam is incorporated into the design and construction of UF_6 cylinder shipping containers known as overpacks. The overpack provides mechanical and thermal protection to UF_6 product cylinders during transport. The phenolic foam is utilized for thermal insulation. An important criterion in overpack design is to limit temperature excursions of the product cylinder below the triple point of UF_6, preventing possible overpressurization of the cylinder. A current requirement is that the product cylinder wall temperature be maintained below the UF_6 triple point with the outer surfaces of the overpack exposed to 1475{degree}F for thirty minutes. A possible heat source is the close proximity of a fire. Overpack thermal protection design requires thermal properties data for the materials of construction, particularly for the phenolic foam insulation which provides the primary thermal resistance. Thermal conductivity and heat capacity data for the phenolic foam are limited in the literature. Accurate heat transfer models of the overpack require thermal properties spanning the ange from room temperature to 1475{degree}F. An experimental program was devised to measure the thermal conductivity and heat capacity of the insulating foam over the temperature span of interest.

37286 (LA-UR—88-865) Design and testing of a prototype water-cooled vacuum interrupter for use in superconducting magnet protection circuits. Parsons, W.M. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 5p. (CONF-880687—4). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007888/JAW.

From 13. international symposium on discharges and electrical insulation in vacuum; Paris, France (27 Jun 1988).

A water-cooled vacuum interrupter was designed and tested for use at 25 kA and 10 kV. This device is expected to have a lifetime approximately one order of magnitude greater than commercial dc circuit breakers. Testing showed that, although the device could successfully carry and interrupt 25 kA, interruption reliabililty was only about 95% with a 10 kV recovery voltage. In addition, a structural crack developed in one electrode from either thermal or mechanical stresses or a combination thereof. 11 refs., 4 figs., 1 tab.

37287 (LA-UR—88-1192) Steps toward lunar settlement. Jones, E.M. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 12p. (CONF-880594—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009141/JAW.

From 100. meeting of the Australia and New Zealand Association for the Advancement of Science; Sydney, Australia (17 May 1988).

The costs of transporting people and material to low-earth-orbit (LEO), and thence to the lunar surface, will constrain the pace and pattern of lunar development. Beginning as a spartan "base camp" completely supplied from Earth, a lunar science-and-resource-development facility could grow in size, amenities, and capability to the point that passenger transport becomes a major expense. At such a stage, some employees of the facility might be given the opportunity to become permanent residents; and at that point, lunar settlement will have begun. We assume growth rates of facilities and staff contained by the annual delivery of 900 tons to LEO. During the base camp era, about 100 tons would be delivered annually to the lunar surface. Within six years, the facility could grow to a collection of 25 modules, housing a staff of about 16 with each member of the staff serving a six-month tour on a staggered schedule. At the end of this first phase, oxygen produced from lunar ilmenite and delivered to lunar orbit for use as propellant would allow annual lunar-bound cargos of about 200 tons. Production from lunar materials of heat shields for aerobraking would enable economical delivery of lunar oxygen to LEO and, therefore, could raise lunar-bound cargoes to about 450 tons. Accumulatin of production capabilities would eventually allow use of lunar construction materials, to build farms and increase per capita living and working space. Once closed-loop environmental systems are in place, transport costs are dominated by staff rotation and the facility is limited to a maximum staff size of about 300. Further expansion requires that some staff become permanent residents.

37288 (LBL—24321) Fabrication of Rutherford-type superconducting cables for construction of dipole magnets. Scanlan, R.M.; Royet, J.; Hannaford, R. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 10p. (CONF-880653—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012027/JAW.

From International conference on cryogenic materials applications and properties; Shenyang, China (7 Jun 1988).

An experimental cabling machine has been constructed and used to investigate the fabrication of a variety of superconducting cables. These include the 23-strand and 30-strand NbTi alloy cables for the Superconducting Supercollider (SSC) and a number of experimental cables. The experimental cables include 24-strands and 36-strands as well as two-level cables with a 6 or 7-strand first level and 23 or 30-strand second level. These results were used to aid in selecting the optimum cable for the SSC dipole and quadrupole magnets. As a result of these studies, cable can now be fabricated to exacting mechanical tolerances (+/- .006 mm) and with low critical current degradation (2-5%). In addition, tooling design studies have been performed and a Prototype SSC Production Cabling Machine has been designed. The results of the cable optimization studies and the tooling design studies will be discussed. SSC cable production experience on the experimental cabling machine and the production cabling machine will be reported.

37289 (LNCC—030/87) Numerical model to analyse the impact between piping and gapped restraints. Galeao, A.C.N.R.; Guerreiro, J.N.C.; Loula, A.F.D. (Laboratorio Nacional de Computacao Cientifica, Rio de Janeiro (Brazil)). 1987. 25p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702465/JAW.

An algorithm to solve the impact between deformable bodies and rigid gapped restrains is presented. This kind of problem occurs in structures of nuclear power plants. This algorithm combines the Newmark method with an impact model which simulates the impulsive force as a retangular pulse. When several restraints are presented the equilibrium and the unilateral conditions are simultaneouly attained by means of an iterative scheme which deals with a reduced flexibility matrix, of the order of the number of unilateral restraints, to avoid the use of the whole matrix of the system. Some numerical examples solved with the proposed algorithm show that no numerical instabilities occur.

37290 (ORNL/TM—9562) Enhancement of ASPEN's [Advanced System for Process ENgineering] equipment cost estimation system. Johnson, P.J.; Myers, M.L.; Begovich, J.M. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 149p. NTIS, PC E07/MF A01; 1; GPO Dep. Order Number DE88009005/JAW.

Includes 2 sheets of 48x reduction microfiche.

Nine new captial equipment costing models have been developed for the VAX 11/780 version of ASPEN (Advanced System for Process ENgineering). The new equipment cost models and three existing ASPEN models which are revised, reflect equipment items typically found in large scale synthetic fuel plants. Included in this report are the new ASPEN User and Technical Reference Manual sections (Appendixes A and B), the FORTMAN subroutines, the code required to revise the ASPEN program (Appendixes D and E), and results from each of the new and revised cost models (in tables in the body of the report).

37291 (ORNL/TM—10524) Test results: The manipulator operator skill test: Consolidated Fuel Reprocessing Program. Draper, J.V.; Omori, E.; Harville, D.L.; Wrisberg, C.A.; Handel, S.J. (Oak Ridge National Lab., TN (USA); Human Machine Interfaces, Inc., Knoxville, TN (USA); Power Reactor and Nuclear Fuel Development Corp., Tokai, Ibaraki (Japan). Tokai Works). Nov 1987. Contract AC05-84OR21400. 22p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88003751/JAW.

The Manipulator Operator Skill Test (MOST) was developed to measure important servomanipulator operator skills. The MOST is based on careful analysis of servomanipulator motions and prototypical remote maintenance tasks. It has been validated with servomanipulator operators from the Oak Ridge National Laboratory (ORNL). This report details the development of the MOST and describes testing carried out with it. Skill test development followed a three-stage strategy. First, a list of job elements deemed important to performance of remote handling tasks was generated. Next, this list was culled for skills which seemed particularly important for maintenance of process-type equipment that will be found in future nuclear reprocessing facilities. Finally, a task was designed that measured key skills, and a procedure for performing the task was developed. The predictive validity of the skill test has been assessed at ORNL. Ten servomanipulator operators participated in a study to determine how well performance of the skill test predicts performance of a realistic remote maintenance task. Multiple linear regression found that the time required to complete the skill test is an effective predictor of realistic task completion time. The multiple R for the predictive equation was 0.97. 4 refs., 6 figs., 7 tabs.

37292 (PB—88-863642/XAB) Sensors and detectors based on superconducting devices. July 1972-May 1988 (Citations from the International Aerospace Abstracts data base). Report for July 1972-May 1988. (National Technical Information Service, Springfield, VA (USA)). May 1988. 131p. NTIS PC N01/MF N01.

Supersedes PB—87-861845; U.S. sales only.

This bibliography contains citations concerning gradiometers, magnetometers, and infrared detectors which use superconductors to improve sensitivity. Applications include biomagnetic measurements for medical studies, gravity-wave experiments, geomagnetism and ocean bottom magnetic exploration, galvanometers and voltmeters, astronomical telescopes, and bolometers and radiometers. Some articles refer to design considerations for cooling systems for the sensors and detectors. (This updated bibliography contains 315 citations, 87 of which are new entries to the previous edition.)

37293 **(SAND—87-0758C) Thermal response of a Type B radioactive transport container.** Moya, J.L.; Akau, R.L. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 30p. (CONF-880724—17). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006451/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

The Beneficial Uses Shipping System (BUSS) cask is a Type-B, passively cooled container designed to transport irradiation source capsules of cesium chloride or strontium flouride. A full-scale thermal test was conducted on an internally-instrumented cask using actual radioactive capsules. The measured transient temperatures were compared to the results obtained from two distinct thermal codes and a fluid dynamics model was developed to study the fluid flow at the cask surface. In addition, the calculated and measured transient thermal responses were used to develop a methodology for predicting the cask thermal load, given the surface temperature at a particular time. 10 refs., 13 figs., 1 tab.

37294 **(SAND—87-7123) Safety assessment for W82 spinner.** Wavrik, R.W. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)). Mar 1988. Contract AC04-76DP00789. 33p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number TI88008006/JAW.

A safety analysis is provided for the W82 spinners that the Oak Ridge Gaseous Diffusion Plant furnishes the Sandia National Laboratory, Albuquerque, and the Bendix Corporation, Kansas City. An assessment of the containment, torsional mounting, air turbine, lid closure, explosive hazard, safety interlocks, and secondary personnel protection is evaluated using the latest available engineering data and containment experience derived from {approximately}25 years of gas centrifuge devlopment and operation. This report is revised to specifically evaluate the spin tester to contain the W-82 telemetry (TM) fixture with a moment of inertia of 4.1 in.-lb-s^2 operating at a speed of 18,000 rpm with an energy level of 7,283,768 in.-lb. The neutron detector (ND) fixture is also covered under the TM limitation because its moment of inertia is 0.33 in.-lb-s^2 with 22,000 rpm operation and an energy level of 875,762 in.-lb.

37295 **(SAND—88-0145) High-velocity impact testing of an accident resistant container using a large centrifuge.** Garcia, J.R.; Weatherbee, R.L. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 16p. NTIS, PC A03;3. Order Number DE88010972/JAW.

An impact test technique using the 35-ft centrifuge located in area III at Sandia National Laboratories in Albuquerque, New Mexico is described. An Accident Resistant Container was thrown into a hard target at impact velocities of up to 425 ft/s using the tangential velocity of the centrifuge. The dynamics of motion in a curvilinear path, design considerations and limitations, hardware, target setup, release mechanism, and instrumentation are discussed. 3 refs., 9 figs.

37296 **(SAND—88-0260) An investigation of soft launch and instability breakup with a two-stage light gas gun.** Grady, D.E.; Moody, R.L. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 31p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010371/JAW.

Exploratory research has been performed in the use of a two-stage light gas gun facility to investigate the soft acceleration and breakup physics of rapidly launched thin plates. A flash radiograph system was joined with the gun facility to provide the principal diagnostic. In the study, radiographs of thin-plate acceleration and breakup were obtained.

37297 **(SAND—88-0518) REGGIE: A 2-D reconnection gun code.** Freeman, J.R. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 35p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010975/JAW.

A simulation code has been written to model the reconnection gun mass accelerator. The code includes the effects of magnetic flux diffusion and convection. The model is based on the solution of a 2-D time-dependent vector potential equation. This solution provides the magnetic force required to compute the self-consistent acceleration of the projectile. The numerical construct of the code is presented. Comparsions with experiments that measured the time-dependent velocity and displacement are also presented. The results show the effects of a late-time braking force. The origins of this force are discussed within.

37298 **(SAND—88-0519C) Airborne remote operated device.** Arlowe, H.D. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 14p. (CONF-880689—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010324/JAW.

From 15. AUVS annual technical symposium; San Diego, CA, USA (6 Jun 1988).

Sandia National Laboratories has recently delivered ten ducted fan airborne reconnaissance vehicles to the US Marine Corps for training and evaluation. This Airborne Remote Operated Device (AROD) concept centers on a ducted fan lifting technique that uses on-board attitude sensors and a stabilization computer to minimize the operator training requirements. These vehicles have been flown under a variety of conditions for over twelve hours. Video tapes of various flights and on-board camera views will be shown. This paper will cover the design, construction, testing, and operator training. Component reliability will be discussed as well as payload options., performance, and possible future program directors such as size, weight, communications, navigation, and operator aids. The paper will conclude that the concept of the AROD vehicle has been well demonstrated and is ready for use in solving problems of noise, communications, navigation, and integration into military tactical structures.

37299 **(SAND—88-0562) Human interfaces in remote driving.** McGovern, D.E. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1988. Contract AC04-76DP00789. 6p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008411/JAW.

Driving vehicles through remote control (teleoperation) can allow the human operator to take actions at a distance. Human effectiveness can be projected into locations which may be hazardous. In order for the operator to control the motion of these vehicles, knowledge of the vehicle environment and status need to be available. This requires a system consisting of vehicle, communication link and human operator. Much work has been done in vehicle and communication system design but comparatively little effort has been devoted to the human interface. In this paper, experimental studies of remote driving are reviewed to approach an understanding of what is known. Summary data is presented for experimental work performed at Sandia National Labs in vehicle vision systems. This information is combined with the experience base developed through several years requiring additional development effort.

37300 **(SAND—88-1222C) A demonstration of retro-traverse using a semi-autonomous land vehicle.** McGovern, D.E.; Klarer, P.R.; Jones, D.P. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 13p. (CONF-8806118—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009851/JAW.

From Conference on space and military applications of automation and robotics; Huntsville, AL, USA (13 Jun 1988).

A Jeep Cherokee has been modified by Sandia National Laboratories to allow remote control either by teleoperation or

through computer generated commands (autonomy). This vehicle has been used for development of hardware and software and in the demonstration of concepts for computer augmentation of remote controlled vehicles. As part of this activity, a system has been configured which allows an operator to teleoperate the vehicle from one location (home base) to another (destination). At the completion of teleoperation, the operator can instruct the vehicle to return to the starting position. The vehicle then autonomously performs a retro-tranverse, reversing the path by which it reached its destination. During teleoperation, operator commands are given through an operator control interface consisting of a steering wheel, brake and throttle pedals, and a video display. Commands are transmitted to the vehicle and video returned from the vehicle over RF communication links. Periodic way points are automatically recorded for later use by the vehicle system. Navigation during retro-traverse utilizes dead-reckoning inputs from an odometer, compass and steering angle potentiometer. Way points (previously identified during teleoperation of the vehicle) are linked by short, straight line segments. Along each path segment, the control system generates the steering and speed commands necessary to direct the vehicle towards the next way point. Retro-traverse has been demonstrated over open terrain at Sandia National Laboratories. Path following accuracy and final positional control is a function of dead-reckoning system limitations and control system design. These limitations are discussed, and an improved system is proposed. 10 refs., 5 figs.

37301 (SVF—249) Method for x-ray radiography of insulating covers of culverts for district heating pipes. Dahn, S. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Feb 1987. 32p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753343/JAW.

A special procedure using tangential x-ray beam direction, very low kilovoltage and x-ray sensitive IC-paper (Instant copy paper) has been developed for practical field application. The main advantages with IC-paper instead of transparent film are lower 'raw-film' cost, much faster and easier development process and thereby a quicker result. When the x-ray technique is applied on piping dimensions 250-500 mm it has been proven that the sensitivity corresponds to the visibility of a radially drilled hole of diameter 3-4 mm through the foam layer. A proper way to verify the image quality has been found to be of major importance, why a special image quality indicator has been designed and tested. This reference body of same dimension as the pipe to be radiographed contains three sections of foam with different densities and has a series of radially drilled holes e.g. 3-4-5-7 and 10 mm. The reference body is to be exposed together with the examined pipe. As unfiltred radiation from a Beryllium window x-ray tube is used, some radiation shielding is necessary for field work. In addition accurate and reproduceable focus-to-film distance is important for reproducible exposure doses. By these reasons two models of telescopic exposure boxes of aluminium have been manufactured and tested under field conditions. In the actual project, also a study of non film techniques was included. The use of x-ray sensitive photo diodes in CCD-coupling as receiving elements was found to be of great interest for primarily examination of straight pipes in the production line. The IC-paper technique was also tested on two circumferential weld joints in steel pipes 139.7 x 3.6 mm containing significant weld defects. The result was clearly positive and indicates the possibility to use the IC method as either a supplement or a substitute to the conventional method with transparent x-ray films.

37302 (SVF—256) Temperature rise of pipelines and cables adjacent to buried district heating pipelines. Carlsson, H.; Molin, J. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). 2 Dec 1986. 50p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752982/JAW.

In this study the temperature distribution in the soil around a district heating pipeline has been calculated. The calculations have been performed for three different cases, summer, winter and yearly average. Climate data for southern Sweden has been used in the calculations. The calculations have been made for PUR-culverts with dimensions DN 25, DN 300 and DN 800, serie 2. The temperature calculations show that the soil temperature near the culvert can reach +25 degrees C during summer while the soil temperature during winter normally is lower. However, below the culvert the soil temperature can raise to +30 degrees C during winter at +120 degrees C water temperature. The effect of the increased soil temperature has been dealt with as water and sewage pipelines, gas pipelines, telecommunication and power cables are concerned. For water and gas pipelines the increase of temperature will be maximum when the flow in the pipeline is zero and this is the only case studied here. Considering the effect of elevated temperature for the different pipelines and cables, recommendations for minimum distances to a district heating pipeline have been given. For certain cases a thermal insulation is recommended between the heating culvert and the adjacent pipelines or cables. (authors).

37303 (SVF—257) Damage on jacketed pipe joints. Ljungqvist, J.; Oddving, B.; Westin, R. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Mar 1987. 59p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752983/JAW.

The project comprises three moments, two of which cover damage and protection against moisture entering the joints. The third moment describes various measuring methods of moisture on the end surfaces of joints. (G.B.).

37304 (SVF—258) Stress analysis of district heating pipes. Pt 3 Dimensioning instructions and program for T-joints. Andersson, S.; Carlsson, H.; Molin, J. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Mar 1987. 46p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752984/JAW.

The design of a pipe system includes calculations of stresses and displacements in straight pipes, curved pipes and branch connections. This report considers the design of branch connections. Stress indices are evaluated only for moment loading. The directions for the design given in this report are valid only for T-joints with a moderate axial force in the branch connection. Expressions are given for calculation of the flexibility in branch connections by using flexibility factors. Stress indices and flexibility factors has been calculated for four different types of T-joints. For each type a number of combinations of pipe dimensions have been analyzed. Branch connections in buried district heating pipe system have been studied. Diagram and tables have been prepared for some frequently occuring design situations. Two cases have been studied, on one hand when axial movement in the branch connection can be neglected on the other when axial movement in the run pipe can be neglected. (authors).

37305 (TKK-KO/LVI—B13) Methods for evaluation of the condition of the water and sewage piping system in blocks of flats. Jaervinen, J.; Jokinen, M.; Tavi, M.; Seppaenen, O.; Forsen, O. (Helsinki Univ. of Technology, Otaniemi (Finland)). 1987. 186p. (In Finnish). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88752861/JAW.

This research was made to develope a method for evaluation of the condition of the water and sewage piping system in blocks of flats. The research was mainly made in the Laboratory of Heating, Ventilating and Air-conditioning of the Helsinki University of Technology. The report includes a summary of the materials and installations used in Finland starting from 1920's. The corrosion of various materials used in piping was studied theoretically and experimentally. The methods applicable to the investigation of piping have been reported and tested in 15 test buildings located in the metropolitan area of Helsinki. The year of construction of the buildings varied between 1911 and 1959. After the preliminary tests in test buildings a method for evaluation of the condition of plumbing system was developed. The method was tested in a building that was under renovation. The method gives possibilities to obtain savings when acceptable parts of plumbing can be preserved and investments postponed.

37306 (UCID—21344) Identification procedure for wire and cable jacket insulations. Priante, S.J. (Lawrence Livermore National Lab., CA (USA)). 11 Jan 1988. Contract W-7405-ENG-48. 6p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008408/JAW.

The fire science group evaluated the flammability of various electrical cable insulations, and also investigated methods to identi-

fy the composition of in-place cable insulations. We used thermogravimetric analysis and differential scanning calorimetry to compile thermograms of various insulation materials. We have compiled this information into a library of thermograms for identification cable insulations. This paper descibes our analysis and gives an index of our library.

37307 **(UCID—21351) Activities in HPM effects phenomenology at LLNL under the DNA/SDI Lth-6 effort.** Cabayan, H.S.; King, R.J. (Lawrence Livermore National Lab., CA (USA)). Jan 1988. Contract W-7405-ENG-48. 29p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008409/JAW.

During the fiscal years 1984-1986, DNA funded an effort at the Lawrence Livermore National Laboratory under the SDI/Lth-6 program to develop models and to study the phenomenology of HPM interaction with systems. The effort concentrated on the following areas: linear coupling/modeling; linear coupling/experiments; nonlinear coupling/modeling; component failure/modeling; component characterization; and electronic subsystem characterization. This report sumarizes these subject areas.

37308 **(UCRL—98703) SSVCO feed characteristics.** Vogtlin, G.E. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 11p. (CONF-8805132—1; CONF-8805132—). NTIS, PC A03;3. Order Number DE88011322/JAW.

From 4. national high power microwave conference; Monterey, CA, USA (9 May 1988).

The Livermore SSVCO has been modeled with 2-D and 3-D finite element electromagnetic codes. The techniques used and results will be described. These codes were recently developed at Lawrence Livermore National Labs. They permit sinusoidal driven nodes, absorber and metal surfaces. Contour plots are available of E-fields, H-fields all axes, total E or H-fields and in the 2-D case, Poynting vectors. 8 refs.

37309 **(UCRL—98704) Insulator design options.** Vogtlin, G.E.; Hofer, W.W.; Wilson, M.J. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 11p. (CONF-8805132—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011321/JAW.

From 4. national high power microwave conference; Monterey, CA, USA (9 May 1988).

Insulators are being designed and tested at Livermore to minimize size and weight. Modeling has taken into account charge accumulation due to electron emission. Insulators with a 45{degree} cone angle have been tested with both polarities of applied voltage across the insulator. Techniques have been developed to shield triple points and reduce the maximum surface stress by using conducting grooves in the insulators. Tests have been conducted with a 1.2 megavolt, 1 microsecond Marx generator and a 3 nanosecond, 400 kV pulse generator. 3 refs.

37310 **(VTT-TIED—774) Hydraulic pumps and hydraulic equipment at low temperatures.** Soudunsaari, R.; Lehto, A. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Oct 1987. 76p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752871/JAW.

The ambient temperature may be -40 - -60 deg C in arctic conditions. This causes hardening and shrinkage of seals, deterioration of the suction ability of hydraulic pumps, brittleness in metals and more viscous hydraulic fluids. This may result in oil leakages and component damage. The suction ability of a piston pump, a vane pump and a gear pump was measured at low temperatures. Mineral oil based hydraulic fluid and synthetic fluid were used. The viscosities of the oils during the tests were above the maximum values recommended by the pump manufacturers. The suction ability of each pump was good. The housing of the vane pump broke in a test carried out at -40 deg C. The cooling of the oil in the tank during the night can be decreased by at least 10-12 deg C by insulation. It is recommendable to use a rotating heater to heat up the oil in different parts of the tank. Assemblies composed of hydraulic tubes and hydraulic tube fittings are tight also at low temperatures if they have been carefully mounted and they are under no external strain. The operation of liquid level switches was good at low temperatures. The connecting pressure of pressure switches normally increased when the temperature decreased and the test pressure increased rapidly. Pressure gauges filled with glycerine are not suitable for use at low temperatures.

37311 **(VTT-TIED—788) Pressure tests of tubes at high temperature.** Maekelae, U.; Jokinen, J. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Nov 1987. 25p. (In Finnish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752998/JAW.

A single creep testing rig has been developed for testing hightemperature tubing under high pressure. The equipment consists of pressurizing unit, furnace and control unit, and includes various features for operator safety. The testing rig is being used for simulating the behaviour of tubes of the hightemperature equipment in power and process industry. Results achieved by the rig are more exact in life time prediction of a component than life time estimation calculations and creep tests.

37312 **(VTT-TUTK—493) Safety of the use of coal power. Part 2. Experiments with silo storage of coal.** Rautalin, A.; Aeijaelae, M. (Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)). Aug 1987. 45p. (In Finnish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752874/JAW.

Knowledge obtained from literature on storage technique of coal crush and powder was completed by storage experiments in Finland's conditions. Storage equipment was instrumented to obtain a good conception of phenomena during storage. Storage of granular coal prepared by sieving, without crushing, was found to be safe even during long-term storage, as regards spontaneous ignition and formation of combustible gases. This coal grade did not show any susceptibility to spontancous ignition.Tendency of granular coal to freezing should be considered in the design of the silo, as no heat generation occurs in the coal or it is very slow. Processing of coal powder, for example, grinding temperature and temperature of coal power when entering the storage, is of great significance to its behaviour in storage. The experiments indicated that coal storage can be managed by monitoring conditions in the storage and by taking necessary measures on the basis of the monitoring results.

37313 **State identification of GaAs(1-bar1-bar1-bar) oxidized surfaces by an x-ray photoemission decomposition method.** Gomez-Goni, J.; Munoz, M.C.; Lopez de Ceballos, I.; Sacedon, J.L. (Instituto de Ciencia de Materiales (CSIC), Serrano 144, E-28006 Madrid, Spain). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2238-2242(Jul 1988).

An x-ray photoemission (XPS) decomposition method has been applied to the oxidation of GaAs(1-bar1-bar1-bar) surfaces, in order to identify the oxidation states. The method, which is based on Fourier transform theory, provides separation of overlap composite spectra into its individual components. The incorporation of truncation techniques, which reduces the spurious structure, allows its application to real unresolved As, Ga, and oxygen core level XPS spectra of oxidized GaAs surfaces. The calculated number and chemical shifts of the Ga and As oxide compounds are in very good agreement with the results obtained by the synthesis method. At least three different forms of bound oxygen, β_3, β_1, and O/sup //sup = /, with chemical shifts of -0.7 eV for the β_2 and 0.9 eV for the O/sup //sup = / referred to the β_1 state, are resolved in the oxygen (1s) XPS spectra.

37314 **Reinforced flexural elements for TEMP-STRESS program.** Marchertas, A.H.; Kennedy, J.M.; Pfeiffer, P.A. (Argonne National Lab., IL (USA). Reactor Analysis and Safety Div.). *Nuclear Engineering and Design;* **106**: No. 1, 87-102(Feb 1988). Contract W-31-109-ENG-38.

The implementation of reinforced flexural elements into the thermal-mechanical finite element program TEMP-STRESS is described. With explicit temporal integration and dynamic relaxation capabilities in the program, the flexural elements provide an efficient method for the treatment of reinforced structures subjected to transient and static loads. The capability of the computer program is illustrated by the solution of several examples: the simulation of a

reinforced concrete beam; simulations of a reinforced concrete containment shell which is subjected to internal pressurization, thermal gradients through the walls, and transient pressure loads. The results of this analysis are relevant in the structural design/safety evaluations of typical reactor containment structures.

37315 **Numerical algorithm for analyzing piping response to thermal transients and seismic excitations.** Wang Chungyi. (Argonne National Lab., IL (USA). Reactor Analysis and Safety Div.). *Nuclear Engineering and Design;* **106:** No. 1, 147-160(Feb 1988). Contract W-31-109-ENG-38.

This paper describes a three-dimensional finite-element method for the structural response analyses of reactor piping systems subjected to thermal transients and seismic excitations. In the thermal-transient analysis, the algorithm appropriately accounts for stresses arising from the temperature dependence of the elastic material properties, the thermal expansion of the materials, and the change in the temperature-dependent yield surface. It includes a thermoviscoplastic constitutive equation that incorporates capabilities of treating thermal softening, failure, strain rate, creep, and stress ratcheting. In the piping seismic analysis, a time-history method is utilized to account for possible nonlinear phenomena as well as to reduce the solution conservatism obtained from response-spectrum analyses. Variation in dominant stress frequencies and translational frequencies are easily handled. The algorithm described herein has been integrated with the implicit time-integration scheme for treating hoop, flexural, axial, and torsion deformations induced by these accident loads. It is valid for large displacement and rotations, but small strains. Both geometrical and material nonlinearities are considered. To illustrate the methodology, several sample problems are given. Results show that this approach is extremely efficient and is suitable for long-duration analyses of reactor piping systems.

37316 **(AD-A—189956/6/XAB) Research at Lincoln Laboratory leading up to the development of the injection laser in 1962.** Rediker, R.H. (Massachusetts Inst. of Tech., Lexington (USA). Lincoln Lab.). Jun 1987. 5p. (JA—5921). NTIS, PC A02/MF A01.

Pub. in IEEE Jnl. on Quantum Electronics, Vol. QE-23, No. 6, 692-695(Jun 1987).

In 1958 the Semiconductor Device Group at Lincoln Laboratory began to concentrate its efforts on exploiting GaAs. these efforts, in addition to yielding diodes which ns switching speeds, led to the development in early 1962 of diodes that emitted near-bandgap radiation with very high efficiency, and to the development in October 1962 of the diode laser. The theory of the semiconductor laser developed at Lincoln Laboratory in the mid-to-late 1950's provided the foundation necessary for the design of the diode laser structure after the highly efficient production of near-bandgap radiation was demonstrated.

37317 **(AD-A—190204/8/XAB) Short-wavelength lasers based on selective Auger processes and core-excited metastable levels. Final technical report, 19 September 1986-19 March 1987.** Harris, S.E.; Young, J.F. (Stanford Univ., CA (USA). Edward L. Ginzton Lab.). Oct 1986. 47p. NTIS, PC A03/MF A01.

The goal of this program is to investigate, both theoretically and experimentally, new approaches to constructing XUV and soft x-ray lasers. At these short wavelengths, atomic spontaneous emission times are typically less than a nanosecond and, for levels that autoionize, are often less than a few picoseconds. It is technically very difficult to excite such levels directly to produce laser action in the way that is commonly done for visible-laser levels. Practical short-wavelength lasers will have a significant impact in many areas of critical national interest; applications include spectroscopy of surfaces, high-resolution lithography, microscopy, and holography. The realization of the great promise of such applications, however, depends on the properties and practicality of the lasers developed. Although there is a 20 year history of proposals for XUV and soft x-ray lasers, most approaches require very high pumping powers. The authors developed systems that can produce useful gain using only moderate input energies by combining the unique properties of particular atomic states with innovative experimental techniques. To date, gain was observed in two species: Xe at 108.9nm, and Zn at three lines around 133nm. Useful gains, exp(3.6), can be achieved with input energies of less than 1J, and small signal gains exceeding exp(40) were achieved using less than 4J input. In the latter case, an output energy of 20 micro J in a beam with 10-mrad divergence was measured at 108.9nm.

37318 **(AD-A—190744/3/XAB) Saturation of the Xe III 109-nm laser using traveling-wave laser-produced-plasma excitation.** Sher, M.H.; Macklin, J.J.; Young, J.F.; Harris, S.E. (Stanford Univ., CA (USA). Edward L. Ginzton Lab.). Nov 1987. 4p. NTIS, PC A02/MF A01.

Pub. in Optics Letters, Vol. 12, No. 11, 891-893(Nov 1987).

Construction and operation of a 109-nm, photoionization-pumped, single-pass laser in Xe III are described. The laser is pumped by soft x rays emitted from a laser-produced plasma in a traveling-wave geometry. Using a 3.5-J, 300-psec, 1064-nm laser pump pulse, a small-signal gain coefficient of 4.4/cm and a total small-signal gain of exp(40) were measured. The laser is fully saturated and produces an output of 20 microJ in a beam with 10-mrad divergence.

37319 **(AD-A—190746/8/XAB) Diode-pumped solid-state laser oscillators for spectroscopic applications.** Byer, R.L.; Basu, S.; Fan, T.Y.; Kozlovsky, W.J.; Nabors, C.D. (Stanford Univ., CA (USA). Dept. of Applied Physics). 1987. 3p. NTIS, PC A02/MF A01.

Pub. in Laser Spectroscopy VIII, 416-419(1987).

Solid-state laser development has been paced by the improvement of pumping sources. The development of high-power, efficient, long-lived diode lasers promises a revolution in solid state laser technology.

37320 **(DOE/DP/40200—65-Vol.33) LLE [Laboratory for Laser Energetics] Review: Quarterly report, October-December 1987.** Kelly, J. (ed.). (Rochester Univ., NY (USA). Lab. for Laser Energetics). 1987. Contract FC08-85DP40200. 60p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE88008065/JAW.

This volume of the LLE Review, covering the period October-December 1987, contains descriptions of the implementation of distributed phase plates for improved irradiation uniformity and the implementation of a cryogenic target capability on the OMEGA facility. The section on advanced technology has reports on the design and optimization of recombination x-ray lasers and a near-infrared dichroic dye for use in both active and passive liquid-crystal devices. Finally, the activities of the National Laser Users Facility and the GDL and OMEGA laser facilities are summarized. The highlights of this issue are (1) Distributed phase plates, implemented on OMEGA, have made the target-plane illumination uniformity insensitive to near-field phase and intensity errors that previously produced hot spots on target. (2) An integrated system for producing, positioning, protecting, and documenting microballoons containing a frozen DT layer was put into operation on the OMEGA target chamber. (3) Recent modeling results using a new, explicit nonlocal treatment of the Doppler-enhanced escape probability of the resonance radiation has shown short-pulse illumination and cylindrical expansion to be very important for producing net gain in carbon recombination x-ray lasers. (4) A near-infrared-absorbing, liquid-crystalline dye has been shown to exhibit dichroic behavior in nematic liquid-crystal hosts. This dye has superior optical absorbance in the 1-μm-wavelength region and excellent solubility in nematic hosts. These properties make this dye/host combination particularly interesting for device applications such as blocking filters, shutters, and modulators for the near infrared.

37321 **(DOE/ER/13788—1) The chirped-pulse free-electron laser: Annual performance report, September 1987-April 1988.** Moore, G.T. (New Mexico Univ., Albuquerque (USA). Center for Advanced Studies). Apr 1988. Contract AC04-76DP00789. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009289/JAW.

A theoretical and numerical investigation is underway of pulsed free electron lasers in which there is a dependence of electron energy on the time of injection into the wiggler. The chirped FEL is investigated using an one-dimensional model, neglecting emittance. Diffraction is included only approximately by projection onto the fundamental Gaussian mode of a stable optical resonator. (LEW)

37322 **(PB—88-184312/XAB) New femtosecond laser source and three dimensional image treatment. Final report.** (Centre de Documentation de l'Armement (CEDOCAR), 75 - Paris (France). Direction des Recherches, Etudes et Techniques). 1985. 54p. (In French). NTIS, PC E04/MF E04.

The chief objective of the study was to provide a femtosecond laser source that combines the advantages of the passive and active systems previously called to mind. The hybrid system thus developed was carefully characterized, using an original method of temporal analysis of the pulses by crossed correlations. Parallel to the development of these sources with high temporal resolution, some applications relating to optical imagery with very high spatial resolution were accomplished. The length of the wave train of a luminous pulse of 50 fs corresponding to fifteen micrometers associated with techniques of nonlinear optics allows imagery at very high resolution. Experiments with two-dimensional imagery for a given side, as well as experiments of thickness measurement in transparent media are described briefly.

37323 **(PB—88-863808/XAB) Neodymium YAG (yttrium-aluminum-garnet) lasers. September 1983-May 1988 (citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for September 1983-May 1988.** (National Technical Information Service, Springfield, VA (USA)). May 1988. 126p. NTIS PC N01/MF N01.

Supersedes PB—87-859674.

This bibliography contains citations concerning the properties and applications of neodymium-yttrium-aluminum-garnet lasers. Applications include welding of parts such as printed circuits, medical applications, telecommunication systems, and optical pumping for high-powered lasers. (This updated bibliography contains 262 citations, 23 of which are new entries to the previous edition.)

37324 **(UCRL—96767) Initial electron distributions for free-electron lasers generated by injector and accelerator simulations.** Boyd, J.K.; Colson, W.B.; Scharlemann, E.T. (Lawrence Livermore National Lab., CA (USA); Berkeley Research Associates, Inc., CA (USA)). 16 Sep 1987. Contract W-7405-ENG-48. 17p. (CONF-8709110—21). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007022/JAW.

From 9. international free-electron laser conference; Williamsburg, VA, USA (14 Sep 1987).

Early free-electron laser (FEL) development was guided by simple performance criteria based on the number of undulator periods, electron beam quality, and current. The beam quality (emittance and energy spread) was used to characterize the initial distribution of axial electron velocities along the undulator axis. While the emittance and energy spread determine the overall width of the distribution, its detailed shape is also important. As new accelerators are designed specifically for FEL applications, it becomes important to obtain distribution shape information from simulations that include the electron gun, accelerator, and beam transport in addition to the usual electron/optical interaction in the undulator. The distribution at the entrance to the undulator can be calculated from numerical simulations of the cathode emission, acceleration, and transport of an electron beam. We have modeled the beam generation, from cathode emission up to the energy of the accelerator injector, using an axisymmetric, cylindrical geometry particle simulation (DPC). This code solves the relativistic force equation with fields obtained from Maxwell's equations in the Darwin model. The DPC calculation is run repeatedly varying parameters such as accelerating stress, electrode configuration, and axial magnetic field profile until a good match is obtained for the accelerator. The beam exiting from the injector can be accelerated and transported using the transfer matrix technique with a simple model for accelerating gaps and magnets. Alternatively, acceleration and transport can be simulated with a particle code that solves for the axisymmetric evolution of a slice of an electron beam including possible emittance growth. The phase space obtained from the accelerator can be evaluated for performance using either the simple FEL integral equation method or the more complete FRED simulation code. 9 refs., 5 figs.

37325 **(UCRL—97575) A new near-infrared tunable-room temperature solid state laser $La_3Ga_5SiO_{14}:Cr^{3+}$.** Lai, S.T.; Chai, B.H.T.; Long, M.; Shinn, M.D. (Allied-Signal, Inc., Morristown, NJ (USA); Lawrence Livermore National Lab., CA (USA)). 1987. Contract W-7405-ENG-48. 2p. (CONF-871060—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011341/JAW.

From Topical meeting on tunable solid state lasers; Williamsburg, VA, USA (26 Oct 1987).

Laser action at room temperature has been achieved in $La_3Ga_5SiO_{14}$:Cr. The laser free running wavelength is 968 nm. The fluorescence quantum yield is 42% at room temperature. A large single crystal boule has been grown by the Czochralski method. 1 ref.

37326 **(UCRL—98068) High spatial frequency thermal blooming instability: A linear stability analysis.** Barnard, J.J. (Lawrence Livermore National Lab., CA (USA)). 29 Apr 1988. Contract W-7405-ENG-48. 24p. (CONF-8803106—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010711/JAW.

From Workshop on physics of directed energy propagation in the atmosphere; Las Cruces, NM, USA (29 Mar 1988).

The fine-scale thermal blooming instability is shown to be affected by the laser pulse length. In this study, we calculate the asymptotic gain of a sinusoidal perturbation as a function of pulse length and perturbation wave number. We include the effects of viscosity, diffusion, and wind shear, and we heuristically estimate the effect of turbulence. We find that for short laser pulses, the small wave number perturbations are reduced due to acoustic effects. However, large wave number perturbations remain large and extend to a higher cutoff in wave number than in the long laser pulse limit. At wave numbers higher than this cutoff, thermal diffusion causes exponential decay of the perturbations. For long laser pulse length wind shear and turbulence limit perturbation growth. 16 refs., 3 figs.

37327 **Configuration interaction calculation of the electronic spectra of $MgF_2:V^{+2}$.** Winter, N.W.; Pitzer, R.M. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Chemical Physics;* **89**: No. 1, 446-451(1 Jul 1988).

The ground and excited quartet states of divalent vanadium in a magnesium fluoride host have been determined from Hartree—Fock and configuration-interaction calculations. The potential energy curves for the symmetric stretch of the nearest-neighbor fluoride ions were determined and used to calculate the vibrational energy levels and wave functions. The ground-state absorption bandwidths were calculated from the Franck—Condon overlaps and compared to the experimental low-temperature spectra. The calculated vertical excited-state absorption energies from the first excited state are also found to be in good agreement with recent measurements.

(US)). pp 26-27 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—). Contract AC04-76DP00789.

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

HAWK, a 1-MV, 2-A, 1-ms electron-beam pumped laser facility, has been constructed to study the kinetics of reactor-driven gas lasers. A highly focused electron beam is injected from a vacuum region through a 4-mm-diameter fast opening valve into a narrow, 43-cm long, gas-filled drift region and then through a larger gate valve into the laser cell. The electron beam is laterally confined by an axial magnetic field. The authors describe numerical simulations of the electron-beam pumped system, obtained with the 3-D Monte Carlo electron-photon transport ACCEPTM code. The calculations include the effects of fringing magnetic fields on a nearly collimated beam at the cavity injection point and of fringing fields at the far end of the laser cell.

37330 **Opacity calculations for laser plasma applications.** Magee, N.H. Jr. pp 103-110 of Lasers '86; Proceedings of the Ninth International Conference on Lasers and Applications, Orlando, FL, Nov. 3-7, 1986. Mcmillan, R.W. Atlanta, GA; Georgia Institute of Technology (1987). (CONF-861177—).

From 9. international conference on lasers and applications; Orlando, FL, USA (3 Nov 1986).

Modifications introduced into the Los Alamos National Laboratory light-element detailed-configuration opacity code LEDCOP to improve its accuracy in determining absorption coefficients and group means for use in laser-plasma thermal-radiation transport calculations are described and demonstrated. Particular attention is given to the inclusion of complete internally consistent LS-term energies and oscillator strengths, the treatment of transitions at all wavelengths, and the use of more accurate photoionization cross sections for both ground and excited states. Sample results for Al, C, and O are presented graphically and shown to be in much better agreement with published experimental data than those calculated with previous codes. 5 references.

This book offers a review of laser-interaction phenomena including important recent advances in the field. The book details the physical properties of power lasers and the optical properties of solids subjected to high photon flux. Also provided is a study of power laser-material interaction, and applications such as the manufacture of thin layers, welding, laser recrystallization, and treatment and laser fusion.

37332 **Scaling analysis of x-ray lasers.** Garrison, J.C.; Chiao, R.Y. (Lawrence Livermore National Lab., Livermore, CA 94550 (US)). pp 66 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper TUGG 36.

The authors found that a scaling analysis maps propagative aspects of x-ray lasers onto other laser systems operating at longer wavelengths. One can then determine experimentally how the output coherence and directionality of the x-ray laser depend on the internal parameters and geometry of the laser. Certain dimensionless numbers, analogous to the Reynold's number in hydrodynamics, emerge from the scaling analysis.

37333 **Prospects for free-electron laser operation in the extreme ultraviolet.** Newnam, B.E. (Los Alamos National Lab., Chemistry and Laser Sciences Div., Los Alamos, NM 87545 (US)). pp 88 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper TUMM 1.

Continued progress by several research groups is increasing the near-term prospects for free-electron laser (FEL) operation into the extreme UV and soft x-ray regions. For wavelengths longer than 1 nm, these devices hold the promise of greatly exceeding the spectral brightness of the present generation of broadly tunable synchrotron light sources. The authors compare the salient features of the FEL oscillator and amplifier configurations which are under active study and development.

37334 **High-gain free-electron lasers: Characteristics and applications.** Kim, K.J. (Lawrence Berkeley Lab., Center for X-Ray Optics, Berkeley, CA 94720 (US)). pp 96 of XV international conference on quantum electronics (Digest of technical papers). From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper WAA 2.

In simple undulators, electrons, which are initially uncorrelated, remain essentially uncorrelated as the electron bunch moves through the undulator. The radiation emitted in this case, called the undulator radiation, is analogous to the spontaneous emission in atomic systems. As the number of undulator periods N increases, the cumulative effects of the radiation-electron beam interaction could lead to a density modulation in the electron beam and an exponential amplification of the undulator radiation. Undulators operating in this regime will be called the high-gain free-electron lasers (FELs). The radiation emitted in this case is called self-amplified spontaneous emission (SASE) by analogy with laser terminology. The high-gain FELs operating in the SASE mode do not require use of high-reflectivity mirrors to form optical cavities. Thus they are promising alternatives to the usual FELs as generators of intense coherent radiation at wavelengths shorter than 1000, A. High-gain FELs can also be used in an amplifier mode if coherent input radiation is available at the desired wavelengths. The coherence properties of the emitted radiation in this mode would be the same as those of the input. The authors studied the characteristics of the high-gain FELs starting from the Maxwell-Klimontovich equation. The use of a microscopic description of electrons, the Kilmontovich distribution function, is necessary to discuss how SASE emerges in long undulators. Also, their analysis is three-dimensional so that important issues such as guiding and transverse coherence can be clarified.

37335 **Physics issues for high-power free-electron laser amplifiers.** Scharlemann, E.T. (Lawrence Livermore National Lab., P.O. Box 808, Livermore, CA 94550 (US)). pp 96 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper WAA 3.

The FEL program at the Lawrence Livermore National Laboratory is examining the physics uncertainties of optical mode quality, optical guiding and wiggler focusing, and the technological problem of wiggler tolerances in the 10.6-μm Paladin experiment. The experiment and its predecessor Elf (at 35 GHz) are reviewed. Efforts to construct a tunable but very accurate electromagnetic wiggler with isochronous focusing are described. Expectations of optical beam quality, optical mode clean-up, and optical guiding are presented.

37336 **Preparation of certain m-aminophenols and the use thereof for preparation of laser dyes.** Hammond, P.R. (to Dept. of Energy, Washington, DC). US Patent 4,622,400. 11 Nov 1986. Filed date 29 Dec 1983. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

Methods are provided for making certain m-aminophenols using a sulfonation/alkali fusion procedure. The aminophenols are key intermediates in the synthesis of dyes, particularly efficient, stable dyes for laser application. Preparations of some rhodamine and phenoxazone dyes from the m-aminophenols are described.

37337 **(AD-A—190158/6/XAB) Observations on the use of the FTS (Filter Test System) 400. Technical note.** Coleman, J.R. (Defence Research Establishment, Ottawa, Ontario (Canada)). May 1987. 18p. (DREO-TN—87-19). NTIS, PC A03/MF A01.

This note contains remarks on the use of the FTS 400, a system designed by TSI Inc. to meet DREO requirements in filter testing. Production of Aerosol: In the range 0.01 - 0.30 micrometer diameter, polydisperse aerosols are produced by atomizing and drying solutions of sodium chloride in water or dioctyl phthalate in isopropanol. The electrostatic classifier selects a narrowly defined size in the range quoted above, which is then employed as the challenge. While the classifier is capable, operating as a standalone instrument, of selecting out particles as large as 1.0 micrometer, operational compromises in the FTS system, related probably to air flow through the classifier, limit the upper size to 0.31 micrometer. For particle size greater than 0.5 micrometers, the aerosol source is aqueous suspensions of monodisperse (very uniformly sized) polystyrene latex spheres (PSL), stored in the 9302 angstrom atomizers of Figure 1. A suspension is dried and diluted and passed through the test object. For reasons given below the APS and not the CNC must be used as the count instrument. Keyword: Canada.

37338 **(CEA-CONF—9240) Study and resolution of Riemann problem for two-phase flow models. Application for numeric diagrams type Godunov.** Toumi, I. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 6p. (In French). (CONF-8711192—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753462/JAW.

From 1. Maghrebin colloquium on numerical models for engineers; Alger, Algeria (22 Nov 1987).

In this paper the author presents a study of the Riemann problem for two-phase flow. The results have been used to construct two numerical scheme of Godunov type.

37339 **(CEA-CONF—9241) Tubular circuits optimization with respect to vibratory risks in flow.** Hassi, H.; Axisa, F. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 14p. (In French). (CONF-8711192—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753463/JAW.

From 1. Maghrebin colloquium on numerical models for engineers; Alger, Algeria (22 Nov 1987).

In this paper the authors describe the methods recently developed for optimization of industrial pipes with respect to vibratory risks. An example for an expansion bend in a hot temperature liquid transport circuit is given.

37340 **(CEA-CONF—9242) Tubes bundles vibrations in turbulent flow. Study by homogenization method.** Hammami, L.; Brochard, D.; Gibert, R.J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 10p. (In French). (CONF-8711192—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753464/JAW.

From 1. Maghrebin colloquium on numerical models for engineers; Alger, Algeria (22 Nov 1987).

In this paper, the authors present an homogenization method for the study of tubes bundles in a turbulent flow. With this method the authors construct an equilibrium equation of homogeneous medium which permits the use of Inca code. Some results are shown.

37341 **(CLM-R—280) Multiphase flow simulations of shocks and detonations: Pt. 2. Detonations.** Thyagaraja, A.; Fletcher, D.F. (UKAEA Culham Lab., Abingdon). Oct 1987. 36p. (MFCIWP—87-P57). H.M. Stationery Office, London, price Pound 5.00.

In this paper we use the multiphase flow code CULDESAC to compute detonations in two-component mixtures. We present results showing the different types of detonations which are possible and illustrate the effect of varying the initial conditions and geometry, and changing the constitutive relations, on the form of the solution obtained. This work represents the first stage in the development of a multi-component model of the propagation stage of a steam explosion.

37342 **(CONF-880772—1) Laser/fluorescent dye flow visualization technique developed for system component thermal hydraulic studies.** Oras, J.J.; Kasza, K.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012008/JAW.

From 3. international symposium on refined flow modelling and turbulence measurements; Tokyo, Japan (26 Jul 1988).

A novel laser flow visualization technique is presented together with examples of its use in visualizing complex flow patterns and plans for its further development. This technique has been successfully used to study (1) the flow in a horizontal pipe subject to temperature transients, to view the formation and breakup of thermally stratified flow and to determine instantaneous velocity distributions in the same flow at various axial locations; (2) the discharge of a stratified pipe flow into a plenum exhibiting a periodic vortex pattern; and (3) the thermal-buoyancy-induced flow channeling on the shell side of a heat exchanger with glass tubes and shell. This application of the technique to heat exchangers is unique. The flow patterns deep within a large tube bundle can be studied under steady or transient conditions. This laser flow visualization technique constitutes a very powerful tool for studying single or multiphase flows in complex thermal system components.

37343 **(CONF-8803102—1) Pressure drop and heat transfer in turbulent non-Newtonian pipe flow of advanced energy transmission fluids.** Choi, U.S.; Liu, K.V.; Kasza, K.E. (Argonne National Lab., IL (USA). Materials and Components Technology Div.). 1988. Contract W-31109-ENG-38. 16p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010021/JAW.

From International conference on advanced science and technology; Chicago, IL, USA (19 Mar 1988).

Argonne National Laboratory (ANL), under sponsorship of the US Department of Energy, is making significant progress on the development of advanced energy transmission fluids for thermal systems, in particular district heating and cooling systems. ANL has identified two concepts for developing advanced energy transmission fluids. Tests have been conducted at ANL to prove these concepts. This paper presents experimental results and discusses the degradation behavior of linear polymer additives and the flow and heat transfer characteristics of non-melting slurry flows. The experimental data obtained in this study provide support for the use of friction reducing additives and slurries in thermal system applications.

37344 **(DOE/ER/13398—9) Effects of surface tension and contact angle on sensible heating and boiling incipience in dielectric falling films.** Marsh, W.J.; Mudawwar, I. (Purdue Univ., Lafayette, IN (USA). Boiling and Two-Phase Flow Lab.). 1988. Contract FG02-85ER13398. 9p. (CONF-880744—1). NTIS, PC A02;3. Order Number DE88007057/JAW.

From Session on boiling phenomena in electronic equipment; Houston, TX, USA (1 Jul 1988).

Predicting the point of incipient boiling is of paramount importance for reliable operation of liquid-cooled microelectronic heat sources during power transients. This study focuses on heat transfer from a simulated multichip module to a falling film. Experiments have been performed to develop an understanding of the influence of surface tension and wetting characteristics in sensible heat transfer and boiling incipience in free-falling dielectric (FC-72) liquid films. A correlation for the space-average heat transfer coefficient is presented which shows clear departure of FC-72 data from correlations obtained for fluids with higher surface tension. The boiling results reveal that the vanishingly small contact angle of FC-72 precluded the application of correlations currently employed to predict incipience. Also, the temperature overshoot commonly encountered upon boiling incipience in wetting fluids was nonexistent in all the experimental runs. 14 refs., 12 figs.

37345 **(IKE—2-77) Investigation of triggered interactions at one or several hot tin melt droplets in water.** Froehlich, G.; Hauk, G. (Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). Apr 1986. 121p. (In German). Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme.

Hot molten tin drops were injected into a vessel filled with water and ignited to an explosive interaction by an underwater bridge wire explosion. From high speed pictures (by spark camera) the time of the beginning of the interaction after shock wave triggering and times of the special expansion stages of the cyclic interactions were determined. Fragment analysises show an increase of the specific fragment surface at higher trigger pressures. The interaction histories of simultaneously triggered drops were compared. Results show that only the timing of the trigger but also small individual differences in drop parameters influence essentially the begin of an explosive drop interaction.

37346 **(JINR—R-8-87-505) Mass flow rate influence on void fraction of two-phase helium flow.** Ko Gym Sek; Mamedov, I.S.; Filippov, Yu.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods). 1987. 14p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702456/JAW.

Based on the minimum entropy production principle an analysis of mass flow rate influence on void fraction of two-phase adiabatic flows is made. The friction factor role and fraction of liquid entrained into vapour steam ones are demonstrated. The results of helium two-phase flow calculations as well as the comparison with analogous reference data are presented. The engineering calculation technique for void fraction of helium two-phase flows is suggested. 19 refs.; 4 figs.

37347 **(JINR-R—8-87-446) Hydrodynamical characteristics of helium two-phase flows at relatively high mass rates.** Son Zun Gan; Selyunin, S.Yu.; Filippov, Yu.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Dept. of New Acceleration Methods). 1987. 12p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702936/JAW.

Submitted to the journal Teploehnergetika.

Theoretical model is proposed for the pressure drop of channels through which the two-phase flow of helium with relatively high mass flow rates moves. With the help of this model the region of hydraulic crysis is predicted. Experimental results which are consistents with the theoretical model predictions are presented. It is shown that under certain conditions the hydrodynamical characteristics of helium two-phase flows and of steam-water ones are analogous and that the existence of some distinctions are caused by the difference in thermophysical properties of helium and water. The data obtained are compared with the results available in literature. 21 refs.; 3 figs.

37348 **(K/SS—504) Rupture testing of UF_6 transport and storage cylinders.** Ziehlke, K.T.; Barlow, C.R. (Martin Marietta Aerospace, Orlando, FL (USA). Missiles and Electronics Group; Oak Ridge Gaseous Diffusion Plant, TN (USA)). 1988. Contract AC05-84OT21400. 2p. (CONF-880558—10; CONF-880558—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010425/JAW.

From Uranium hexafluoride--safe handling, processing, and transporting conference; Oak Ridge, TN, USA (24 May 1988).

Rupture tests have been conducted on pressure vessels of all sizes and designs in current commercial use in the transport and storage of uranium hexafluoride. The test results have demonstrated the general conformance of the cylinders to their design criteria. Several of the test cylinders were taken from active service. A few were made available as the result of handling mishaps: These were a dented 48-inch cylinder and two type 30B cylinders damaged in a warehouse fire. The tests have shown that the stiffening ring butt weld serves to localize the failure of the 48-inch cylinders, with an associated penalty in ultimate pressure. They have also shown the extreme conservation of design in the case of the 5-inch cylinder, the only product cylinder qualified for 100% enriched material. Finally, they have shown a basic tendency toward brittle fracture in over-pressuring of the DOT-qualified type 30A cylinder, resulting in a recommendation for discontinuation of its use as a transport cylinder.

37349 **(PB—88-182449/XAB) Literature survey of slug flow.** Pauchon, C. (SINTEF, Trondheim (Norway)). 8 Dec 1987. 91p. (STF—11-A87070). NTIS, PC E05/MF E05.

A review of the various aspects of slug-flow modeling is presented in an attempt to highlight the governing parameters and their interdependence. With the aim of providing important information that could serve as a basis for future modeling work in the area, attention is focused on the characteristics of the various models, and on aspects that need careful consideration with regard to extrapolation to large-scale systems.

37350 **(PB—88-182456/XAB) Terrain slugging phenomena. Some experimental results obtained at the SINTEF Two-Phase Flow Laboratory.** Linga, H. (SINTEF, Trondheim (Norway)). 8 Nov 1987. 21p. (STF—11-A87049). NTIS, PC E03/MF E03.

An experimental study of the topography influence on terrain slugging was performed. A bump is introduced in the horizontal line upstream of a line-riser low-point. This causes the terrain-slugging region to be significantly enlarged. Also the upper pressure limit for terrain slugging is increased from some 60 bar to 75 bar. The experimental observations clearly demonstrate that terrain slugging is a strongly system-dependent phenomenon.

37351 **(PB—88-182464/XAB) Applicability of the shear stress device K-tube in two-phase flow.** Onarud, G. (SINTEF, Trondheim (Norway)). 1 Jun 1987. 50p. (STF—11-A87037). NTIS, PC E04/MF E04.

The shear stress measuring device K-tube has been tested for accuracy and applicability in horizontal two-phase flow in a 24-mm pipe at atmospheric pressure. If the hole diameter is too big compared to the film thickness the film will be subjected to a too high degree of disturbance and hence affect the measurements one way or the other. In order to establish an acceptable hole diameter, several different K-tubes were tested with hole diameters varying from 0.4 to 4.0 mm. The investigation has confirmed that the K-tube is applicable in two-phase flow if some precautions are taken.

37352 **(RISO-M—2641) Computer model simulation of two-phase flow instability in a full-scale pipeline-riser system.** Rathmann, O.; Iversen, S. (Lic Consult Raadgivende Ingenioerer A/S, Copenhagen (Denmark); Risoe National Lab., Roskilde (Denmark)). May 1987. 52p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752806/JAW.

The onset of two-phase flow instability (severe slugging) in an existing full-scale pipeline-riser system, for which observations of severe slugging exist, has been simulated by the computer models MULTWO and LICTWOP. The models contain submodels for most relevant flow patterns (e.g. horizontal/inclined stratified flow and vertical slug flow), by which a fine agreement with the measured steady state data can be obtained. No ad-hoc models for severe slugging were added. Both the numerical simulations with the computer models and separate analytical studies stress the importance of a proper numerical representation of wave propagation phenomena for a reliable prediction of severe slugging. 10 refs.

37353 **A numerical study of transient conjugate natural convection in an enclosed stratified fluid.** Gopalakrishna, S.; Himasekhar, K.; Lior, N. (Univ. of Pennsylvania, Dept. of Mechanical Engineering and Applied Mechanics, Philadelphia, PA (US)). pp 177-182 of Heat transfer: Pittsburgh 1987. Lyczkowski, R.W. New York, NY; American Institute of Chemieal Engineers (1987). (CONF-870816—).

From 24. national heat transfer conference and exhibition; Pittsburgh, PA, USA (9 Aug 1987).

The objective of this study is to determine the effect of heat transfer in the walls of a container on natural convection in the enclosure filled with an initially-stable stratified fluid. A two-dimensional wallfluid transient conjugate heat transfer problem in an enclosure with the top and bottom walls insulated is solved numerically for Rayleigh numbers of 6.7×10^7, 6.7×10^8 and 6.7×10^9 with Pr=6.7, Bi=0 and 0.02, and for three different wall materials. A stratification index, S, is proposed and evaluated: it decreases sharply with increasing Rayleigh number and wall thermal diffusivity in contrast to the case of a perfectly insulating wall.

37354 **Proton-coupled transport of alkali metal cations across liquid membranes by ionizable crown ethers.** Bartsch, R.A.; Charewicz, W.A.; Kang, S.I.; Walkowiak, W. (Dept. of Chemistry and Biochemistry, Texas Tech Univ., Lubbock, TX (US)). pp 86-97 of Liquid membranes: Theory and applications. Noble, R.D.; Way, J.D. Washington, DC; American Chemical Society (1987). (CONF-860645—).

From 8. Rocky Mountain regional meeting of the American Chemical Society: liquid membranes - theory and applications; Denver, CO, USA (8 Jun 1986).

Crown ether carboxyl acids and phosphonic acid monoalkyl esters are novel reagents for the active transport of alkali metal cations across organic liquid membranes. Metal ion transport is coupled to the back transport of protons. The influence of structural variation within the ionizable crown ether carrier molecule upon the selectivity and efficiency of competitive alkali metal transport across bulk liquid, liquid surfactant (emulsion), and polymer-supported liquid membranes is assessed.

37355 **Hydrogen sulfide facilitated transport in perfluorosulfonic acid membranes.** Way, J.D.; Noble, R.D. (National Bureau of Standards, Center for Chemical Engineering, Boulder, CO (US)). pp 123-137 of Liquid membranes: Theory and applications. Noble, R.D.; Way, J.D. Washington, DC; American Chemical Society (1987). (CONF-860645—).

From 8. Rocky Mountain regional meeting of the American Chemical Society: liquid membranes - theory and applications; Denver, CO, USA (8 Jun 1986).

Hydrogen sulfide and methane fluxes were measured at ambient conditions for 200 μm perfluorosulfonic acid cation exchange membranes containing monopositive EDA counterions as carriers. Facilitation factors up to 26.4 and separation factors for H_2SCH_4 up to 1200 were observed. The H_2S transport is diffusion limited. The data are well represented by a simplified reaction equilibrium model. Model predictions indicate that H_2S facilitated transport would be diffusion limited even at a membrane thickness of 1 μm.

37356 **(AD-A—190235/2/XAB) Computational model for armor penetration. Annual report No. 2, October 1979-October 1980.** Erlich, D.C.; Seaman, L.; Curran, D.R.; Shockey, D.A.; Caligiuri, R.D. (SRI International, Menlo Park, CA (USA)). Oct 1987. 218p. NTIS, PC A10/MF A01.

Results are reported from the second year of a three-year BRL/AMMRC/SRI program to develop a computational capability for predicting the behind-the-armor fragment environment for spaced armor attacked by long-rod penetrators. The baseline materials chosen were rolled homogenous steel armor (RHA) and depleted uranium (DU) for the penetrator. Phenomenological studies involving both quarter and full-scale ballistics tests at velocities up to 1.5 km/s and obliquities from 0 to 70 clearly revealed shear banding to be the principal phenomenon controlling both penetrator erosion and armor failure. A detailed, phenomenological scenario for oblique armor penetration is given . Contained fragmenting cylinder (CFC) experiments were performed to characterize the resistance of RHA to shear banding; a significant anisotropy was observed. The SHEAR3 computational model for shear banding was refined and calibrated with respect to previously obtained data from CFC experiments using 4340 steel (Rc40).

37357 **(BFR-R—111-1986) Development and evaluation of selective coatings for window.** Ribbing, C.G. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 58p. (In Swedish). NTIS (US Sales Only), PC A04. Order Number DE88752906/JAW.

Selective coatings intended for energy efficient windows have been studied on laboratory scale. The study mainly related to preparation of coatings of tin oxide, silver and titanium nitride and measurement of the optical properties of these, but commercially available coatings have also been investigated with regard to degradation mechanisms, and calculations of energy saving effect have been made. Different dopants have been tested as well as an alternative technique in which the dopants are directly added to the aerosol. Highest selectivity is obtained when ammonium fluoride is used as the dopant. Thin silverfilms which were magnetronsputtered at low pressure exhibited a significantly higher selectivity depending on improved homogeneity. The previously predicted selectivity of thin films of titanium nitride has been verified. The IR reflectivity of thin films has been enhanced by sputtering onto a heated glass substrate. Calculations show that the almost neutral color of these coatings can be precisely controlled by additions of minute amounts of carbon. In this context, color coordinate calculations were made for commercially available coatings under solar transmission conditions. The energy gains for an argon filled selective double glazed window, in comparison with an ordinary double glazed window, were found to be approximately 150 kWh per m/sb2/ per annum. The savings is clearly greater than what can be achieved by using a triple glazed window.

37358 **(BMU—1987-148) Experimental study on the application of noise emission analysis in pressure testing of a reactor pressure vessel. Final report.** Eisenblaetter, J. (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Battelle-Institut e.V., Frankfurt am Main (Germany, F.R.)). Sep 1986. 104p. (In German). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, Germany, F.R.

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

The object of the investigations was the large containment of the MPA Stuttgart, a BWR pressure vessel, which is prepared with a large number of faults in welds and in the basic material. Six pressure tests up to the working pressure of a Boiling Water Reactor (71 bar) were carried out. Apart from the global multi-channel location technique, local supervisory methods were also used. The proof of a large number of different indications next to each other was possible with global location. The known faults did not, however, all emit to the expected extent. On the other hand, faults not previously known on some welds were shown to the testers; these indications were confirmed by subsequent non-destructive tests. An improvement in accuracy of location in local location by a factor of 20-30 using signal analysis, was demonstrated compared to global location.

37359 **(CONF-8805132—5) HPM coupling into realistic targets.** Bacon, L.D.; Aurand, J.F.; Toth, R.P. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 14p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011788/JAW.

From 4. national high power microwave conference; Monterey, CA, USA (9 May 1988).

High-Power Microwave coupling into targets of interest is extremely difficult to assess analytically or numerically. The practicalities of accurately modeling physical structures, as well as the subtlety of determining which simplifications are allowable for the accuracy needed, require that target interaction calculations be verified by careful laboratory measurements. In addition, the differ-

ences in construction techniques and tolerances on joints and seams make an experimental scan of the parameter space essential if we are to establish rules-of-thumb for coupling into systems. To meet this need for a benchmark for HPM coupling calculations, we have designed and constructed several RF shielding enclosures with generic but realistic joints and seams. We measured the coupling of RF into these enclosures over the frequency range of 45 MHz to 18 GHz, recording both amplitude and phase information. These data allow us to evaluate the response of various ports-of-entry to both continuous wave and pulsed sources. We can see trends with frequency for various port of entry types that relate to relatively simple geometric factors. This paper outlines what these results for generic targets imply for HPM coupling to real systems.

37360 **(CONF-8806121—1) Workshops and problems for benchmarking eddy current codes.** Turner, L.R.; Davey, K.; Ida, N.; Rodger, D.; Kameari, A.; Bossavit, A.; Emson, C.R.I. (Argonne National Lab., IL (USA); Georgia Inst. of Tech., Atlanta (USA); Akron Univ., OH (USA); Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan); Electricite de France, 92 - Clamart; Rutherford Appleton Lab., Chilton (UK)). Feb 1988. Contract W-31109-ENG-38. 12p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009996/JAW.

From International symposium on fusion nuclear technology (ISFNT); Tokyo, Japan (10 Jun 1988).

A series of six workshops was held to compare eddy current codes, using six benchmark problems. The problems include transient and steady-state ac magnetic fields, close and far boundary conditions, magnetic and non-magnetic materials. All the problems are based either on experiments or on geometries that can be solved analytically. The workshops and solutions to the problems are described. Results show that many different methods and formulations give satisfactory solutions, and that in many cases reduced dimensionality or coarse discretization can give acceptable results while reducing the computer time required. 13 refs., 1 tab.

37361 **(DOE/ER/45315—1) The effects of gradients on boundary stability: Progress report, 1 July 1987-31 March 1988.** Hackney, S.A.; Plichta, M.R.; Lee, J.K. (Michigan Technological Univ., Houghton (USA). Dept. of Metallurgical Engineering). 1988. Contract FG02-87ER45315. 21p. NTIS, PC A03/MF A01;3. Order Number DE88009592/JAW.

This report discusses effects that will change grain boundary stability. In particular, morphological transitions and thermotransport induced grain boundary migration are briefly mentioned. 7 figs. (LSP)

37362 **(EPRI-NP—5834) Nondestructive examination of welds through painted surfaces: Final report.** Cook, J.F.; Holm, J.A.; Lassahn, G.D. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1988. Contract AC07-76ID01570. 92p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88011428/JAW.

A study was performed to develop reliable nondestructive examination techniques for detection of surface-open defects located under a surface coating on ferromagnetic materials. The magnetic particle test method (MT) alternating current (ac) yoke technique presently appears to be an optimum approach because of its technically straight-forward operational basis. A complementary technique uses the eddy current method with a differential type probe. The techniques were verified on both cracked samples and artificial flaws through varying thicknesses of real and simulated coatings. An analytical study of the MT yoke technique, experimental details and test data are presented. On the basis of the test results, recommended changes to ASME Section XI requirements are identified for consideration.

37363 **(INIS-BR—1080) Radioactivity as a means of nondestructive testing.** Wagh, A.S.; Pinnock, W. (West Indies Univ., Mona (Jamaica). Dept. of Chemistry). 1986. 18p. (CONF-8609282—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702778/JAW.

From 1. non destructive testing congress for Latin America and Caribbean; Sao Paulo, Brazil (21 Sep 1986).

An attempt is made to develop a method in which certain solutions with radioactive solutes can be used as liquid penetrants. The gamma activity can be measured using a conventional counter. This activity gives a measure of the quantity of the penetrated fluid and an assessment of the depth and size of the flaw can be determined. We discuss two cases. a) The use of external penetrants and b) the use of inherent activity in the material. The first case is applicable in metallurgy while the second case is applicable to building material. The experimental arrangements will be discussed and critical comparisons with other methods will be done. The limitations of the method due to occupational health aspects will also be discussed.

37364 **(INIS-BR—1081) Reduced program of inspection by induced currents for condenser of Embalse nuclear power plant.** Obrutsky, L.; Mendonca, H. (Comision Nacional de Energia Atomica, Buenos Aires (Argentina)). 1986. 14p. (In Spanish). (CONF-8609282—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702779/JAW.

From 1. non destructive testing congress for Latin America and Caribbean; Sao Paulo, Brazil (21 Sep 1986).

In this work it's presented a reduced inspection in service program by the technique of induced currents to the turbine condenser of Embalse's Power Plant (Cordoba). The authors based its elaboration on the results obtained in the exam of a small number of tubes and on experience obtained through four inspections in the condensers of Atucha I Power Plant, through mathematical models of oxygen and ammoniac distribution in both Power Plants, and its experimental verification in the case of Atucha I. This program improves the quality of inspection thereby reducing time, equipment and personnel employed. (C.M.).

37365 **(SAND—88-0068C) Gaseous tracer techniques for pore structure characterization of granular materials.** Erickson, K. L. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 15p. (CONF-880750—7). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011542/JAW.

From 13. international pyrotechnics seminar; Grand Junction, CO, USA (11 Jul 1988).

The pore structure of granular materials influences several physical and chemical phenomena, including: 1) heat and mass transfer rates, 2) fluid dynamics, 3) mechanical response, and 4) heterogeneous chemical reaction rates. In many systems, these phenomena are coupled, and accurate pore structure characterization is important to developing reliable predictive models. Gaseous tracer techniques show promise as a rapid nondestructive method for characterizing pore structures. To provide a basis for developing a theoretical and experimental approach involving multiple tracer techniques, five characteristic parameters were defined to describe the major features of a macroscopically uniform pore structure. Those parameters are the following: 1) the portion of the total pore space that forms flow paths (flow porosity), 2) the fraction that forms relatively stagnant paths (stagnant porosity), 3) the tortuosity of the flow porosity, 4) the specific surface area of the pore space, and 5) the fraction of the specific surface area that is associated with the flow porosity. Initial experiments with samples having simple, known pore structures were conducted to evaluate the theory and experimental techniques. Agreement between known and experimentally determined parameter values was good. Furthermore, it appears that the tracer techniques can have broad application as nondestructive diagnostic tools for examining granular materials.

37366 **(SAND—88-0460) Trafficability probe testing in sand and clay targets.** Foster, A.D.; Young, E.R.; Gillings, K.K. (Sandia National Labs., Albuquerque, NM (USA)). Mar 1988. Contract AC04-76DP00789. 131p. NTIS, PC A07;3. Order Number DE88010974/JAW.

In September 1981, a series of tests were conducted at the Marine Base, Camp Pendleton, California, using an air gun to launch instrumented penetrators into sand and clay targets. The purpose of the tests was to collect penetrator deceleration and structural response data along with soil information and to assess the feasibility of establishing the type and strength of the soil encountered from the measured data. 6 refs., 43 figs., 16 tabs.

37367 **(SAND—88-0825) Development of a biaxial test system for thin-walled metal tubes using tensile-compressive axial load and internal-external pressure.** Schmale, D.T.; Bourcier, R.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 48p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011279/JAW.

A biaxial deformation test system has been developed to perform tensile-compressive axial loading and internal-external pressurization of thin-walled metal tubes. The system has been added to an existing MTS 490 kN load frame with a PDP 11/34 based computer control system. It consists of: (a) specimen grips, (b) high pressure chamber, (c) a hydraulic intensifier and controller and (d) associated valving and switching. Software has been written in the MTS MultiUser-BASIC language to perform simple multiaxial cyclic deformation of a tubular specimen. The design of the mechanical test system and software are described and preliminary test results for the deformation of 316 stainless steel tubing under various proportional loading paths are presented. 19 refs., 14 figs.

37368 **(STEV-FVE—87-8) Culverts for district heating with directly applied polyurethane insulation. Thermal stability of structures.** Jarfelt, U. (Statens Energiverk, Stockholm (Sweden)). Sep 1987. 161p. (In Swedish). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752961/JAW.

Testing equipment and methods have been developed for laboratory tests of polyurethane culverts. Heat losses can be determined as regards ageing and temperature levels. The equipment is described and a number of thermal insulation capacities of culverts have been determined. (G.B.).

37369 **(Y/DW—741) NDE performance in predicting failure strength of spherical composite specimens with implanted flaws.** Brosey, W.D.; Calfee, M.T.; Whittaker, J.W.; Henneke, E.G.; Post, D.; Reifsnider, K.L.; Blake, R.A. (Oak Ridge Y-12 Plant, TN (USA); Virginia Polytechnic Inst. and State Univ., Blacksburg (USA); Delaware Univ., Newark (USA)). 8 Feb 1988. Contract AC05-84OR21400. 21p. (CONF-880487—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008223/JAW.

From American Society of Nondestructive Testing (ASNT) spring conference; Orlando, FL, USA (11 Apr 1988).

The results of a program to evaluate nondestructive inspection techniques on spherical composite specimens are presented. Seventy Kevlar-epoxy filament wound specimens were made such that ten of the specimens contained one of seven defect conditions which simulated manufacturing or handling defects. These defect conditions were a standard no-defect condition, Teflon-shim simulated delamination, ceramic bead simulated voids, 10% low-fiber alternate winding pattern, low-modulus alternate fiber type, variable tension, and dry (low-matrix) fiber. Some specimens were impact damaged by dropping them from various heights to a hard surface. Each specimen was inspected using a variety of nondestructive techniques to determine which methods were useful for detecting the defect conditions in the specimens. These techniques included combinations of A, B, and C-scan ultrasonics, acousto-ultrasonics, x-ray CAT scans, radiography, thermography, optical stress coating, and acoustic emission. The specimens were subsequently pressurized to failure to determine any detrimental effect the implanted flaw types might have on enclosed geometry structures. One important finding in the study was that nominal defects introduced during the manufacturing or handling process do not significantly reduce the ultimate burst strength of the composite material in this geometry when creep and fatigue mechanisms are insignificant. 11 refs., 12 figs.

37370 **(AD-A—190032/3/XAB) Rapid feature extraction via the Radon Transform. Final report, 1 October 1985-1 December 1987.** Gmitro, A.F.; Gindi, G.R. (Yale Univ., New Haven, CT (USA)). 1 Feb 1988. 33p. NTIS, PC A03/MF A01.

The investigators explored the area of neural-net associative memories and their optical implementations. The problem of organizing an associative memory to reflect known structure in the pattern is addressed; because the structure is encoded as a model in the memory, the memory differs considerably from simple pattern matchers where an iconic version of the pattern is stored. Early work concentrated on the idea of encoding a compositional hierarchy within the memory. Though this worked well, the theory was inadequate to explain the behavior of the memory. An optimization approach was adopted in which the goal of the computation could be stated in a mathematical objective function. The ideas of compositional and inheritance hierarchies were encoded directly into the objective function. A simulator was completed that demonstrated these ideas. Optical implementation was concerned with the problem of implementing ever more general interconnect patterns. The investigators began with the construction of a system that computed Radon Transforms of the input object. This demonstrated the necessary first step of an optical-connection scheme to transform objects to parameter spaces. A more complex system was built that demonstrated discrete space-invariant connection patterns. This worked satisfactorily. The current work involves designs for holographic space-variant connection patterns.

37371 **(AD-A—190129/7/XAB) Fundamental properties and devices applications of Ge(x)Si(1-x)/Si superlattices. Technical report, 1 August 1985-31 July 1987.** Wang, K.L. (California Univ., Los Angeles (USA)). 1987. 49p. NTIS, PC A03/MF A01.

The progress include (a) growth and characterization of Ge(x)Si(1-x)/Si epitaxial films and superlattices, (b) study of power loss by two dimensional holes in coherently strained Ge(x)Si(1-x)/Si heterostructures, (c) theoretical prediction of resonances of intraband absorption (d) study of B_2O_3 as a low temperature p-type dopant. Initial stage of growth of Ge(x)Si(1-x)/Si films were studied using reflection high-energy electron diffraction (RHEED) and the superlattice structures were characterized using TEM. In the study of magnetotransport of holes in Ge(x)Si(1-x)/Si SLS's, it was found that the power-loss data can be well understood by taking into account the effects from the acoustic mode phonons by both the deformation potential and the piezoelectric coupling. The resonance nature of intraband absorption can be used for sensitive and tunable IR-detector applications. The possibility of using B_2O_3 as an effective p-type doping source is demonstrated for providing abrupt doping profiles needed for GE(x)Si(1-x)/Si superlattices.

37372 **(AD-A—190169/3/XAB) High-density ion-implanted contiguous-disk-bubble technology. Annual Scientific Report No. 1, 30 September 1986-29 September 1987.** Kryder, M.H.; Greve, D.W.; Guzman, A.; Jo, S.C.; Ramesh, M. (Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Electrical and Computer Engineering). 31 Oct 1987. 267p. NTIS, PC A12/MF A01.

During the past year the authors advanced the state-of-the-art in several areas of magnetic-bubble technology. The main thrust of their research was to advance ion-implanted contiguous disk devices because these devices offer order-of-magnitude higher bit density than presently manufactured bubble devices. Noteworthy accomplishments include demonstration of bubble propagation in devices having 4 sq micrometer bit cells and exhibiting operating margins equal to those of today's manufactured devices. These devices were demonstrated to operate from 0 to 120 C, the limits of the testing capabilities. A major factor in this success was development of new epitaxial garnet materials that exhibited isotropic magnetostrictive properties -- a feature previously not obtained. In addition to the work on bubble propagation, significant progress was made

on demonstrating a fully operational contiguous-disk chip, complete with bubble generators, transfer gates and stretcher/detectors. All components have been demonstrated to operate with good overlapping margins, and a complete chip was designed and fabricated.

37373 **(AD-A—190223/8/XAB) Real-time stressed-channel simulator. Final report.** (TCS, Inc., San Diego, CA (USA)). 10 Dec 1987. 74p. (TCS-TP—87-059). NTIS, PC A04/MF A01.

The Strategic Defense Initiative (SDI) research efforts are directed at a number of system-architecture options involving space, airborne, and terrestrial platforms. A major consideration in the system architecture is the resolution of the battle management (BM) concept. To resolve the many complex issues, the Strategic Defense Initiative Organization (SDIO) has recognized the need for communication, command, and control (C3) data links between the various platforms. The link or communication-channel conditions are relatively benign during peacetime; however, in wartime situations, during pre-, trans-, and post-attack periods, the channel conditions degrade rapidly causing severe disruptions in C3. The approaches to battle management, as they are tailored to the various architecture options being considered, will depend heavily upon the communications-link integrity. This research is significant and timely in that it relates to the National Test Bed (NTB), in support of the SDI full-state development decision process. The NTB program is presently being undertaken by major contractors and involves the design, development, and installation of both experimental and simulation capabilities to form the NTB. This Phase I research effort takes a major step in configuring a Real-Time Stressed Channel Simulator (RTSCS) to evaluate BM/C3 concepts for the SDI program.

37374 **(AD-A—190678/3/XAB) Implementation and performance analysis of parallel assignment algorithms on a hypercube computer. Master's thesis.** Carpenter, B.A. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1987. 165p. (AFIT/GCE/ENG—87-2). NTIS, PC A08/MF A01.

The process of effectively coordinating and controlling resources during a military engagement is known as Battle Management/ Command, Control, and Communications (BM/C3). One key task of BM/C3 is allocating weapons to destroy targets. The focus of this research is on developing parallel methods to achieve fast and cost-effective assignment of weapons to targets. Using the sequential Hungarian method for solving the assignment problem as a basis, this report presents the development and relative performance comparison of four parallel assignment algorithms implemented on the Intel IPSC hypercube computer. The first approach partitions the problem space into smaller, independent subproblems and assigns each to a processing node in the hypercube. The second and third approaches also partition the problem space, but they assign each partition to a group of processing nodes. Each group is controlled by a separate node which further subdivides the partition among members of the group. In the second approach, the control node acts as an arbitrator to eliminate the redundant assignment of weapons to targets by idling redundantly allocated weapons. The third approach eliminates redundant weapon allocations by selecting the least-costly redundant allocations and directing additional processing to reallocate the more-costly weapons. The fourth approach is a parallel implementation of the Hungarian algorithm, where certain subtasks are performed in parallel. This approach produces an optimal assignment instead of the sub-optimal assignment generally obtained using either of the three heuristic approaches.

37375 **(AD-A—190745/0/XAB) Second-harmonic generation of a continuous-wave diode-pumped Nd:YAG laser using an externally resonant cavity.** Kozlovsky, W.J.; Nabors, C.D.; Byer, R.L. (Stanford Univ., CA (USA). Edward L. Ginzton Lab.). Dec 1987. 4p. NTIS, PC A02/MF A01.

Pub. in Optics Letters, Vol. 12, No. 12, 1014-1016(Dec 1987).

The authors report 13% second-harmonic conversion efficiency of a 15-mW, c-w, diode laser-pumped Nd: YAG oscillator. 2 mW of single-axial-mode 532-nm radiation was generated by externally resonant second-harmonic generation in a monolithic MgO-doped lithium niobate nonlinear crystal cavity. The measured finesse of 450 for the monolithic external cavity indicated that absorption and scatter losses in the doubler were less than 0.8%.

37376 **(CONF-880701—2) Experimental determination of the effects of steep front-short duration surges on 25 kVA pole mounted distribution transformers.** Eichler, C.H.; Legro, J.R.; Barnes, P.R. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Systems Technology Div.; Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009056/JAW.

From IEEE Power Engineering Society summer meeting; Portland, OR, USA (24 Jul 1988).

Nineteen standard commercial, 7200-volt, 25-kVa distribution transformers were tested to determine vulnerability of their insulation systems to steep front-short duration (SFSD) surges. These transformers were tested both with and without surge arresters using the high voltage pulser at the Maxwell Laboratories, San Diego, CA. The open circuit pulser test voltages were 400 kV, 500 kV, 800kV, and 1000kV. These voltages exhibited an approximately 60 ns rise time and aproximately 2000 ns to half value. The voltage was applied to the transformer under test through a 400-Ohm series resistor. This series resistor represented the distribution line surge impedance. Standard lightning impulse tests for this voltage class of distribution transformers were conducted prior to the steep front surge tests to verify insulation integrity, and were repeated following the steep-front surge tests to ascertain if an insulation failure had occurred in the tested transformer due to the steep-front impulse. Failed transformers were disassembled to evaluate failure modes. It was determined that no insulation failures occurred on any transformers tested that were protected by surge arresters mounted directly on the transformer. An external flashover of the high voltage bushing occurred in some cases when the transformer was not protected by a surge arrester, but the bushing sparkover was not always sufficient to protect the transformer. Unprotected transformers failed at voltages around 250 kV to 300 kV peak. The failure mode was usually an internal flashover/puncture between the first few turns of the outer layer of the high voltage winding and the low voltage winding or, sometimes, to an inner layer of the high voltage winding. 10 refs., 10 figs., 1 tab.

37377 **(LA—11243-MS) Chip cooling concepts: Combined groundplane and coldplate.** Bennett, G.A.; Hedstrom, J.C. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 32p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009576/JAW.

Careful thermal design is essential for realizing improvements in power density and efficiency of high-power microwave transistor amplifiers. A systematic study of a nonconventional microwave power amplifier module component is made to quantify its thermal behavior and to identify specific changes that would reduce thermal resistance. These improvements would lead to more compact, lighter-weight, and higher-power density designs for microwave power systems. Improvements in radio-frequency (RF) amplifiers begin with enhancements in the performance of the transistor building block. Previous work defined thermally optimum package materials and geometry using the conventional transistor package components. Further improvements in thermal performance, beyond the package, can be obtained by modifying the conventional cooling system geometry that includes a transistor, mounted to a groundplane, and a circuit board. These are both then mounted on a coldplate. This report describes the results of the analyses of a nonconventional amplifier module and cooling system. Results of the analyses are shown as a series of tables and in plots of temperature vs time and in isotherm contour plots. 20 refs., 25 figs., 5 tabs.

37378 **(LA-UR—88-1070) Recent advances in high-power microwave amplifiers.** Reid, D.W. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 4p. (CONF-880565—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007820/JAW.

From IEEE MTT-S international microwave symposium; New York, NY, USA (25 May 1988).

Recent advances in microwave amplifiers have increased efficiencies and power levels at frequencies from 0.3–150 GHz. These improvements have occurred in both solid-state and vacuum-tube systems. Of special note is the very high power device where power levels of 1 GW are routinely generated. This paper will review the latest results of these R&D efforts. 3 refs., 4 figs.

37379 **(LBL—21546) Preliminary measurements of gamma ray effects on characteristics of broad-band GaAs field-effect transistor preamplifiers.** Jackson, H.G.; Shimizu, T.T.; Leskovar, B. (Lawrence Berkeley Lab., CA (USA)). Jan 1985. Contract AC03-76SF00098. 8p. NTIS, PC A02/MF A01; GPO Dep. Order Number TI88008417/JAW.

The effect of gamma radiation on electrical characteristics of cryogenically cooled broad-band low-noise microwave preamplifiers has been preliminarily evaluated. The change in the gain and noise figure of a 1-2 GHz preamplifier using GaAs microwave transistors was determined at gamma doses between 10^5 rad to 5 {times} 10^6 rad. The gain and noise figure was measured at ambient temperatures of 300 K and 80 K. 8 refs., 2 figs.

37380 **(LBL—24799) Effects of near interfacial microstructure on toughness and subcritical crack growth in ceramic/metal systems.** Oh, T.S.; Cannon, R.M.; Rodel, J.; Glaeser, A.M.; Ritchie, R.O. (Lawrence Berkeley Lab., CA (USA)). Feb 1988. Contract AC03-76SF00098. 17p. (CONF-880671—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009842/JAW.

From International conference on composite interfaces; Cleveland, OH, USA (13 Jun 1988).

Methods to toughen ceramicmetal interfaces that employ prescribed arrays of non-coplanar microcrack-like-voids and inclined interface steps are assessed. These features, developed in glasscopper samples made using photolithographic, metal deposition and diffusion bonding processes, promote crack-tip shielding principally from crack bridging by ligaments generated by plastic void growth within the copper. The ensuing plastic stretching, and sometimes tearing, of the Cu film ligaments yield the major energy dissipation. Crack deflection can also provide a smaller toughening contribution. Resistance-curve (R-curve) behavior obtains from the bridging, with fracture energies rising to an asymptote that varies from 9 to 160 Jm^2, compared with inherent toughness values of {approximately}2 Jm^2 for the specific glassCu interfaces used. The arrays retard subcritical crack-growth rates, which are higher in moist atmospheres, by orders of magnitude compared to rates for plain interfaces. The behavior is contrasted with that gained by using better interface chemistry to increase the inherent fracture toughness of glassCu bonds. 38 refs., 10 figs.

37381 **(PB—88-183918/XAB) Mitsubishi Cable Industries Review No. 74, October 1987.** (Mitsubishi Cable Industries Ltd., Tokyo (Japan)). 1987. 113p. NTIS, PC E05.

37382 **(SAND—87-2764C) Effects of X irradiation and high field electron injection on the properties of rapid thermal oxides.** Schubert, W.K.; Seager, C.H. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 8p. (CONF-880549—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011620/JAW.

From Electrochemical Society spring meeting; Atlanta, GA, USA (15 May 1988).

The effects of x-ray exposure and high field electron injection on the electrical properties of capacitors incorporating rapid thermal oxides show a considerable dependence on the particular post-oxidation annealing (POA) conditions used during oxide processing. Most important seem to be the POA ambient and temperature. POA temperatures from 1150 to 800{degree}C have been investigated, with lower temperatures resulting in reduced midgap voltage shifts for a given x-ray dose or injected electron fluence. Low-temperature high field injection experiments on the present samples have failed to show a direct conversion from trapped holes to interface states formed after photoinjection of electrons as has been reported for conventionally grown thicker oxides. Rather, the injected electrons seem to simply neutralize the trapped holes, returning the capacitance-voltage curve to near its original position and shape. 30 refs., 4 figs.

37383 **(SAND—87-3017C) Phase comparator for range imaging laser radar.** Wessendorf, K.O.; Scott, M.W.; Grohman, M.A. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 6p. (CONF-880579—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008109/JAW.

From 10. annual ideas in science and electronics exposition; Albuquerque, NM, USA (10 May 1988).

A range imaging laser radar using gallium arsenide (GaAs) laser technology has been developed. An image is constructed by scanning the beam in two dimensions over the scene. Our development system transmits an intensity modulated laser beam and determines range by measuring the phase difference of the local oscillator to that of the return signal. Since a 1GHz clock is used to measure this phase difference a theoretical maximum of 1 nsec., or six inches, of range change can be resolved. An amplifier is required to convert the received signal, of wide dynamic range, into a digital waveform for the counter circuit. To obtain the highest possible system resolution this amplifier must impart a minimum amount of phase shift over the dynamic range of the received signal. To maintain a high signal to noise ratio the amplifier must have a narrow bandwidth. Three approaches to the design of an appropriate signal amplifier were explored. A diode clamping amplifier, an automatic gain control circuit, and a cascaded differential amplifier were fabricated and tested. The differential amplifier circuit provided the best fit to the design goals and demonstrated a phase shift of {+-}3ns over a dynamic range of 70dB. This amplifier has been used in a radar to obtain range images of scale models of targets in the laboratory. 6 figs.

37384 **(SAND—87-3080C) Analytical design of a high bandwidth optoelectronic signal link for use in an EMP [electromagnetic pulse] plus radiation environment.** Anthes, J.P. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 7p. (CONF-880579—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009470/JAW.

From 10. annual ideas in science and electronics exposition; Albuquerque, NM, USA (10 May 1988).

Electronic systems which must operate in an electromagnetic pulse (EMP) environment are often enclosed in a conducting box, or Faraday enclosure. The conducting walls must have apertures to allow communications with systems outside the enclosure. EMP leakage is minimized when the aperture diameter is small and has finite thickness. In addition, the penetration of a Faraday enclosure by a conductor may result in a significant portion of EMP induced noise inside the enclosure. Optical signals, because of their short wavelength, can efficiently traverse apertures that are highly attenuating to EMP signals. A communication link consisting of a GaAlAs laser diode source, optical fiber, and a photodiode detector is well suited to this application. Optical transport efficiency between an optical-fiber-coupled 10-stripe laser diode array and a radiation tolerant AlGaAs photodiode is optimized with a graded refractive index (GRIN) rod lens. The lens is positioned in the conducting wall of a Faraday enclosure. The radiation tolerant photodiode is contained inside the enclosure to control EMP induced degradation of the signal-to-noise ratio of the link. The AlGaAs photodiode double heterostructure design controls the ionizing-radiation-induced degradation of the link. An optical design analysis is performed to satisfy two criteria. First we select acceptable lens length-to-radius ratios for an aperture filled by a dielectric medium (the glass GRIN-rod lens). This criteria determines the upper limit

on potential EMP leakage through the lens and into the Faraday enclosure. Second, we utilize the lens image condition to achieve 98% optical transfer between a nanosecond response, optical-fiber-coupled laser diode and the radiation hardened photodiode. 15 refs., 6 figs.

37385 **(SAND—88-0094C) A weighting/threshold approach to sensor fusion.** Amai, W.A. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-8804128—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010349/JAW.

From 1. annual national symposium on sensor fusion; Orlando, FL, USA (5 Apr 1988).

A weighting/threshold-based sensor fusion algorithm to decrease the false alarm rate (FAR) while maintaining a high probability of detection (PD) is being tested in the Remote Security Station (RSS). The RSS is being developed to provide temporary intrusion-detection capability on short notice. It consists of a portable, multisensor pod connected by cable to a manned control console. The pod is set up outdoors in the location that security is needed; the console and operator are located in a command bunker up to a kilometer away. The RSS software filters out alarms from low-believability sensors and also filters out alarms in low-priority areas. Each sensor's believability is proportionally enclosed as a weighing, which is continually updated as a function of the environmental conditions affecting that sensor. Area priority is proportionally encoded as a threshold value for each pie-wedge area around the pod. When an event in an area triggers one or more sensors, their weightings are summed and then compared to the area threshold value. The operator is informed of the event only if the summed weighting exceeds the threshold. Extensive field testing has not yet been done, but some results show the current sensor fusion algorithm decreases the FAR at the expense of lowering the PD. To increase the PD while retaining a low FAR, the weighting/threshold algorithm will be modified to use temporal data and pattern recognition. 4 refs., 2 figs.

37386 **(SAND—88-0315C) Compact, repetitive, 6.5 kilojoule Marx generator.** Lancaster, K.T.; Clark, R.S.; Buttram, M.T. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 14p. (CONF-880699—3). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011784/JAW.

From 18. power modulator symposium; Hilton Head, SC, USA (20 Jun 1988).

Repetitive Marx generator technology developed has been actively pursued for many years at Sandia National Laboratories. Four repetitive Marx generators with voltages to 1 MV, energies to 20 kJ and repetition rates to 50 Hz have been built, tested, and used in on-line experiments. These devices have proven to be reliable pulsed power energy sources. The 440 kV, 6 kJ, 1 Hz Marx generator in this report was designed using this existing technology base. The repetitive Marx generator is an attractive power source for many applications for a variety of reasons. Circuit-wise a Marx is simple, being essentially a capacitor and inductor in series. This permits its use in a variety of configurations ranging from a pulse-forming line charger to an element of a pulse-forming network. At slow repetition rates (1 Hz to 10 Hz) Marx generators can be fabricated almost entirely from commercial components making them both inexpensive and quick to build. Generally they can be easily reconfigured as requirements change, making them a flexible laboratory tool. When designed conservatively, they are also useful for some commercial applications outside the laboratory. In this paper we illustrate the latter point by discussing the design and development of a compact field-transportable, repetitive Marx generator that was designed and built in three months. The authors also review the options considered before choosing the Marx design, and the use of commercially-available hardware in the Marx generator's construction.

37387 **(SAND—88-0458) Liquid Metal Thermal Electric Converter bench test module.** Lukens, L.L.; Andraka, C.E.; Moreno, J.B. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 300p. NTIS, PC A13/MF A01;1; GPO Dep. Order Number DE88009857/JAW.

This report describes the design, fabrication, and test of a Liquid Metal Thermal Electric Converter Bench Test Module. The work presented in this document was conducted as a part of Heat Engine Task of the US Department of Energy's (DOE) Solar Thermal Technology Program. The objective of this task is the development and evaluation of heat engine technologies applicable to distributed receiver systems, in particular, dish electric systems.

37388 **(SAND—88-0472C) P-well or N-well CMOS technology for advanced SEU-hard SRAMs.** Fu, J.S. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 5p. (CONF-880730—4). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88006845/JAW.

From 25. annual conference on nuclear and space radiation effects; Portland, OR, USA (12 Jul 1988).

The decoupling resistances required for SEU hardening CMOS SRAMs of the 2μm p-well and n-well technologies are compared. An advanced device-plus-circuit simulator has been used to illuminate the underpinings of why one technology is intrinsically more SEU tolerant than the other. 3 refs., 5 figs.

37389 **(SAND—88-1139C) Sol-gel processing of metal-oxide-semiconductor structures.** Warren, W.L.; Lenahan, P.M.; Brinker, C.J. (Pennsylvania State Univ., University Park (USA). Dept. of Engineering Science and Mechanics; Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 9p. (CONF-8804114—1; CONF-8804114—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009853/JAW.

From Better ceramics through chemistry III; Reno, NV, USA (5 Apr 1988).

We have investigated the electronic properties of sol-gel derived films on silicon substrates. Our investigation involves SiO_2, aluminosilicate and borosilicate oxides on silicon. Some sol-gel oxides are excellent insulators; some sol-gel films on silicon also exhibit quite low oxidesilicon interface state densities. We have also subjected sol-gel films on silicon to 4 MRAD of radiation and have found that these structures appear to be radiation hard (very little oxide space charge or interface state generation). Our results strongly suggest that sol-gel processing could provide insulating films for a variety of microelectronic device applications. 21 refs., 6 figs., 2 tabs.

37390 **(SAND—88-1330C) Ellipsometric imaging of drying sol-gel films.** Hurd, A.J.; Brinker, C.J. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 13p. (CONF-880408—28). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011785/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

Although controlled dip-coating is an established way to apply high quality uniform coatings, the details of the coating and drying process have not been deeply studied. Depending on the physical and chemical state of the sol and the parameters of dipping (dipping angle and speed), a variety of thicknesses and porosities can be achieved. For optical coatings, the refractive index and optical thickness can thereby be controlled. The authors have developed a method to view the drying front of a dip-coated film using broad beam ellipsometry, or ellipsometric imaging. In dip-coated films we take full advantage of the fact that a steady state is quickly reached where the drying line velocity matches the withdrawal velocity; however, the technique might also be used in unsteady situations such as spin coating. Imaging ellipsometry makes it possible to measure the refractive index and thickness profiles of both wet and dry films point-by-point in an entire image at once. These profiles provide important clues as to the relative importance of gravity, evaporation and other phenomena.

37391 **(SAND—88-1579C) Electrical properties of metal-oxide-silicon structures with sol-gel oxides.** Warren, W.L.; Lenahan, P.M.; Brinker, C.J. (Pennsylvania State Univ., University Park (USA). Dept. of Engineering Science and Mechanics; Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 9p. (CONF-880408—29). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011791/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

The authors have investigated the electronic properties of sol-gel derived films on silicon substrates. Our investigation involves SiO_2, aluminosilicate and borosilicate oxides on silicon. Some sol-gel oxides are excellent insulators; some sol-gel films on silicon also exhibit quite low oxide/silicon interface trap densities. We have also subjected sol-gel films on silicon to 4 Mrad(SiO_2) of radiation and have found that these structures appear to be radiation hard (very little radiation induced oxide space charge or interface trap generation). Our results strongly suggest that sol-gel processing could provide insulating films for a variety of microelectronic device applications.

37392 **(SAND—88-8215) An OKQPSK modem incorporating numerically controlled carrier synthesis.** Oetken, R.E. (Sandia National Labs., Livermore, CA (USA)). 4 Apr 1988. Contract AC04-76DR00789. 50p. NTIS, PC A03;3. Order Number DE88009536/JAW.

The feasibility of incorporating numerically controlled oscillators (NCO) in communication related applications is evaluated. NCO generation of sinusoids may prove useful in systems requiring precise frequency control, tuning linearity, and orthogonality versus frequency. An OKQPSK modem operating at a data rate of 200 kb/s was fabricated. The modem operates in a back to back hardwired channel and thus does not incorporate carrier or symbol timing recovery. Spectra of the NCO generated sinusoids are presented along with waveforms from the modulation and demodulation process. Generation of sinusoids in the digital domain is a viable alternative to analog oscillators. Implementation of an NCO should be considered when frequency allocation, tuning bandwidth, or frequency hopped transmission requires precise frequency synthesis. 24 figs.

37393 **(UCRL—97765) A GaAs solid state device model for high power applications.** Orvis, W.J.; Khanaka, G.H.; Yee, J.H. (Lawrence Livermore National Lab., CA (USA)). May 1988. Contract W-7405-ENG-48. 11p. (CONF-8805132—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011320/JAW.

From 4. national high power microwave conference; Monterey, CA, USA (9 May 1988).

Due to their speed and radiation tolerance, gallium arsenide solid state devices are becoming more and more prevalent in consumer and defense electronics. Because of this increase in use, we have modeled gallium arsenide device operation in the high power, short pulse regime. This modeling includes avalanche generation, heat generation and flow, and inter-valley transfer of electrons. 10 refs., 7 figs., 1 tab.

37394 **(UCRL—98572) A channelless, multilayer router.** Lunow, R.E. (Lawrence Livermore National Lab., CA (USA)). 15 Mar 1988. Contract W-7405-ENG-48. 6p. (CONF-880649—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011333/JAW.

From 25. ACM/IEEE design automation conference; Anaheim, CA, USA (12 Jun 1988).

We have implemented a channel-less, gridless, multilayer router as part of the Magic IC layout system. The router is designed to handle new routing problems associated with emerging technologies such as Wafer Scale Integration and multilayered metal processes. Three features distinguish this router: rectilinear Steiner trees with floating segments, a routing scheduler, and a corner-stitched database. 7 refs., 2 figs., 4 tabs.

37395 **(UCRL—98609) An interactive maze router with hints.** Arnold, M.H.; Scott, W.S. (Lawrence Livermore National Lab., CA (USA)). 15 Mar 1988. Contract W-7405-ENG-48. 15p. (CONF-880649—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011332/JAW.

From 25. ACM/IEEE design automation conference; Anaheim, CA, USA (12 Jun 1988).

This paper presents the Irouter, an interactive maze router for the Magic IC layout editor that takes hints. The Irouter is a flexible tool intended to be useful wherever tight or unusual constraints do not permit automatic routing. It has already been used in the layout of an 80,000 transistor CNOS chip developed by our group at LLNL, and is currently being used to route the control signals of a 100,000 transistor, high performance, EPU chip being developed by the Berkeley SPUR project. Several novel ideas for maze routing have been developed in the Irouter. Hint layers permit the user to map out the general path of a route and pull the route in desired directions, while leaving detail, such as obeying the design rules, to the router. The gross structure of the layout is preprocessed to facilitate accurate estimates of cost to completion during routing and hence effective pruning of misdirected partial routes. A windowed search strategy slowly shifts the focus from the start point towards the goal. This permits the consideration of alternatives at all stages of routing without blowing up into an exhaustive search. 11 refs., 6 figs.

37396 **Schottky barrier instabilities due to contamination.** Newman, N.; Liliental-Weber, Z.; Weber, E.R.; Washburn, J.; Spicer, W.E. (Stanford Electronics Laboratories, Stanford University, Stanford, California 94305, Material and Molecular Research Division, Lawrence Berkeley Laboratory, Berkeley, California 94720). *Applied Physics Letters;* **53**: No. 2, 145-147(11 Jul 1988).

We reported here a systematic study of the annealing-induced changes in the barrier height of Schottky barrier diodes fabricated on atomically clean and contaminated surfaces. Al, Ag, Au, and Cr/GaAs(110) diodes were fabricated by in situ deposition on clean n-type GaAs(110) surfaces prepared by cleavage in ultrahigh vacuum and on contaminated surfaces prepared by cleavage and exposure to the atmosphere for ~1—2 h. This study demonstrates that the as-deposited barrier height and the annealing-induced changes in the barrier height of diodes formed with an interfacial layer of contamination are distinctly different from the characteristics of diodes formed on clean semiconductor surfaces. The presence of an interfacial layer of contamination is found to significantly degrade the stability of the diode's barrier height to annealing.

37397 **Schottky barrier formation on $(NH_4)_2S$-treated n- and p-type (100)GaAs.** Carpenter, M.S.; Melloch, M.R.; Dungan, T.E. (Purdue University, School of Electrical Engineering, West Lafayette, Indiana 47907). *Applied Physics Letters;* **53**: No. 1, 66-68(4 Jul 1988).

Because of a large surface state density, which effectively pins the Fermi level at the surface, metals with vastly different work functions and chemistry produce very similar Schottky barriers when deposited on GaAs. We have investigated the effects of an $(NH_4)_2S$ surface treatment on the formation of Schottky barriers on n- and p-type GaAs. Samples which have undergone the $(NH_4)_2S$ treatment show a reduced pinning of the Fermi level at the surface and hence Schottky barriers which are more sensitive to the metal work function.

37398 **Stepped linear piston displacement fundamental leak calibration system.** Thornberg, S.M. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2522-2527(Jul 1988).

A fundamental leak calibration apparatus has been developed that measures gas leak rates. The stepped linear piston displacement (SLIPD) system decreases the calibration time for leaks in the 10^{-11}—10^{-6} mol/s (2×10^{-7}—2×10^{-2} atm cm^3/s at 0 °C) range without increasing the uncertainty when compared to other related techniques. Calibration times have been reduced by up to a factor of 10 (depending on the leak rate) over the current P ΔV system used by the Sandia Primary Standards Laboratory for more than

four years. The SLIPD system is computer controlled and requires minimal operator input. Furthermore, the total systematic uncertainty of < +- 1.1% (from 10^{-10} to 10^{-6} mol/s) is roughly the same as that for a P ΔV system and intercomparisons between the two systems for the same leaks agree to better than +- 1.0%.

37399 **Data acquisition system for an electron beam welder.** Milewski, J.O.; Dixon, R.D. (Materials Science and Technology Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 6: No. 4, 2586-2588(Jul 1988).

A data acquisition system for an electron-beam welder has been designed and fabricated. The data acquisition system has been used for precise doc umentation of weld variables, storage of the data and subsequent statistic al analysis of the data. Observation of the data during weld studies has shown that some maintenance was needed by the welder. The accuracy with w hich we can monitor the weld parameters is significantly better than that available with existing metering. (AIP)

37400 **(ORNL/tr—88/9) Current status and trends in compressor development: 3, Supporting components for compressors: 3.1, Inverter.** Ide, Yuichi; Kanazawa, Hidetoshi. Translated from Reito [Refrigeration] *Reito ;* 62: No. 721, 47-53(Nov 1987). Contract AC05-84OR21400. 23p. Q/MF A01;1.

It has been 7 years since the inverter-controlled air conditioner was introduced in 1980 as a commercial air conditioner. In the following years, it was applied to the residential heat pump air conditioner. During the past seven years the technology and product reliability of the inverter have improved significantly. Many characteristics of the inverter such as heating and cooling capability, comfort, and energy efficiency have also improved since the first unit was introduced. In the domestic market, moreover, approximately {1/3} of all air conditioners (1 million units for the 1987 cooling year) are expected to be of the inverter type, and the inverter has become an integral part of air conditioners. The major components of the inverter are semiconductors such as microprocessors and power transistors. The reason the inverter technology for air conditioner has rapidly improved is that the technical advancement of these components coincided with the timing of the development of the inverter air/conditioner. This paper discusses current trends and future development of inverter technology with emphasis on the inverter used in home air conditioners.

37401 **(PNL-SA—15872) Site characterization: technical approaches to RCRA compliance.** Smith, R.M.; Schalla, R. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 12p. (CONF-8805144—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011895/JAW.

From Hazardous waste outlook for the 90's; Spokane, WA, USA (23 May 1988).

The basic premise of this report is that RCRA compliance for site characterization and ground-water monitoring is subject to technical interpretation resulting in a negotiated compliance between the responsible party and the regulatory agency. The degree to which the responsible party can exercise technical license in designing a ground-water monitoring system varies between components of the system. However, the responsible party must convince the regulatory agency that the data collected truly represent the ground-water system and that the approach taken is technically sound. While much progress has been made toward developing tools and strategies for adequately characterizing disposal sites, additional developments are needed in both monitoring hardware and interpretive techniques.

37402 **(STEV-FBT—88-12) Measurements of the environment at the pilot plant for condensor flue gas cleaning at Hoegdalen plant.** Ericsson, S.O.; Lindman, E.K. (Statens Energiverk, Stockholm (Sweden)). 20 Aug 1987. 186p. (In Swedish). NTIS (US Sales Only), PC A09. Order Number DE88753338/JAW.

A comprehensive study was carried out during 1986. The flue gas cleaning facility consisted of an economizer, a cleaning reactor and a water treatment system. Flow rates, degrees of separation and emissions to air and water of acidiferous substances, mercury, dust and heavy metals were measured under 12 different sets of operating conditions. Dioxines and other organic compounds were measured under two sets of operating conditions. A total of 4000 analyses were performed. In conjunction with the environmental study, material testing of the scrubber was also carried out. Corrosion was 3-20 times greater in the flue gas inlet than in the water zone. (G.B.).

4210 Combustion Systems

REFER ALSO TO CITATION(S) 35608, 35609, 35610, 35616, 35631, 35933, 36150, 36151, 36888

37403 **(KTM/E-D—120) Absorption heat pumps.** Huhtinen, M.; Heikkilae, M.; Andersson, R. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Mar 1987. 89p. (In Finnish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752820/JAW.

The aim of the study was to analyse the technical and economic feasibility of absorption heat pumps in Finland. The work was done as a case study: the technical and economic analyses have been carried out for six different cases, where in each the suitable size and type of the heat pump plant and the auxiliary components and connections were specified. The study also detailed the costs concerning the procurement, installation and test runs of the machinery, as well as the savings in energy costs incurred by the introduction of the plant. Conclusions were drawn of the economic viability of the applications studied. The following cases were analysed: Heat recovery from flue gases and production of district heat in plants using peat, natural gas and municipal wastes as a fuel. Heat recovery in the pulp and paper industry for the upgrading of pressure of secondary steam and for the heating of white liquor and combustion and drying air. Heat recovery in a peat-fulled heat and power plant from flue gases that have been used for the drying of peat. According to the study, the absorption heat pump suits best to the production of district heat, when the heat source is the condensing heat of flue gas moisture and the primary energy is steam produced by the boiler. Included in the flue gas condensing is the purification of flue gases. Accordingly, benefit is gained on two levels in this application. In heat and power plants the use of absorption heat pumps is less economical, due to the fact that the steam used by the pump reduces the production of electricity, which is rated clearly higher than heat.

37404 **(KTM/E-D—127) Possibilities and costs of reducing the nitric oxide emissions from the energy production.** Jaanu, K. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). 1987. 140p. (In Finnish). NTIS (US Sales Only), PC A07. Order Number DE88752821/JAW.

The nitric oxide emissions in Finland are annually about 220,000 tonnes as expressed in terms of NO_2, of which the share of the traffic is more than a half. Peat and heavy fuel oil in energy generation cause emissions equally much per energy unit, whereas the specific emissions caused by coal are bigger, even twice as much. Regionally nitric oxide emissions are biggest in southern Finland because of heavy traffic and large energy supply. For the environment the emissions caused by the traffic are most dangerous as emissions "disappear" slowly from the "canyons" of the streets. It is cheapest to reduce nitric oxide emissions in power plant boilers if only combustin technical solutions are used. In that case it is possible to achieve a reduction of 40-50% and even higher in fluidized bed combustion. By installing the catalytic nitric oxide reduction equipment to the end part of the plant it is possible to reduce emissions as much as 15-20% from the starting level. However, the catalytic equipment means today an additional cost of FIM 3-

4MWh in fuel at the solid fuel fired plants. The biggest cost factor is the ageing of the catalyzer. However, the catalytic removal of NO/sub x/ emissions from big power plants is much cheaper than the catalytic removal of NO/sub x/ in traffic. At small heavy fuel oil fired plants the cheapest way of reducing nitric oxide emissions is to use low-nitric fuel oil. At the same time, sulphur, sulphur oxide, solid particles and heavy metal emissions also reduce. Combustion technique increases solid particle emissions in heavy fuel combustion. The catalytic cleanin method is not suitable for oil-fired boilers in discontinuous use. Nitric oxide emissions of wood and wood waste are low, the same applies to light oil and natural gas except gas turbines. For gas turbines the combustion technique is bringing new solutions.

37405 **(KTM/E-D—132) Condensing boilers using natural gas as a fuel. Preliminary study.** Lihavainen, L.; Kauppinen, H. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). 1987. 36p. (In Finnish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752822/JAW.

A condensing boiler utilises the latent heat contained in the flue gases by condensation of the water vapour. Using the latent heat of condensation means a remarkable improvement in an annual efficiency. An actual condensing boiler can reach an annual effeciency of 96 to 102% (calculated with the net heat value of natural gas). In comparison with a conventional one, a high efficiency condensing boiler can offer significant gas savings (even 25%). The operating principle of a condensing boiler is simple: the main difference compared to a conventional boiler is the second heat exhanger, where the condensation occurs. The first heat exhanger operates dry as in a conventional boiler. To achieve the maximum benefit from a condensing boiler, a low return boiler water temperature and a high water dew point of the flue gases are the most important requirements. The condensate is acidic. Therefore materials for condensing boilers as well as for flue ducts and sewer pipes should be corrosion resistant. Natural gas is an ideal fuel for condensing boilers because of a high water dew point of the flue gases, a high content of water vapour in the flue gases, a very low content of sulphur and a possibility to operate at the low levels of excess air.

37406 **(KTM/E-D—140) Nitrogen oxide emissions from the various types of boilers in Finland.** Hupa, M.; Backman, R.; Bostroem, S. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Aug 1987. 127p. (In Finnish). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88752827/JAW.

This report discusses nitrogen oxide emissions from the various types of boilers in Finland. The boilers have been classified into 61 classes according to their size, combustion technique and main fuel. A specific emission coefficient (mg NO_2MJ) for each class has been determined, based on literature survey and actual measurements. The total NO/sub x/-emission has been calculated for each class using the emission coefficient and energy statistics. The effect of various techniques for emission reduction has also been investigated. The development of NO/sub x/-emissions has been estimated for both the case where no preventing actions have been taken and for four defined cases where alternative reduction measures are assumed. Further a calculation is made of the total investment required for two of the cases. The total NO/sub x/-emission from energy production was 96 000 t NO_2 in 1986. Two thirds of this amount originated from boilers larger than 5 MW and the rest from smaller boilers and industrial processes. The two most important boiler classes from the NO/sub x/-emissions point of view were coal fired boilers with an emission of approx. 24 000 t NO_2 and boilers fired with a mixture of fuels, approx. 15 000 NO_2. By 2005 the total NO/sub x/-emission from energy production would increase 60% to approx. 160 000 tons if it is left uncontrolled. The emission level would be 140 000 tons if primary reduction techniques are applied and 110 000 t NO_2 if also catalytic NO/sub x/ reduction devices are installed in boilers larger than 300 MW.

37407 **(ORNL/M—462) Ceramic Technology for Advanced Heat Engines Program data base: A summary report.** Booker, M.K. (Oak Ridge National Lab., TN (USA)). [1988]. Contract AC05-84OR21400. 94p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88008954/JAW.

A large amount and wide variety of data on the behavior of advanced ceramic materials is currently being generated within the Ceramic Technology for Advanced Heat Engines Program. This paper summarizes efforts to date to develop a computer data base system for the management of those data. The system is based on the use of desktop microcomputers, which provides a maximum of efficiency, economy, and convenience in the operation of the system.

37408 **(STEV-FBT—88-4) Investigation of straw combustion systems. The combustion laboratory in Borgeby.** Paahlstorp, S.; Nilsson, S. (Statens Energiverk, Stockholm (Sweden); Swedish Univ. of Agricultural Sciences, Lund. Dept. of Farm Buildings). 1987. 85p. (In Swedish). (SLU-LBT-S—148). NTIS (US Sales Only), PC A05. Order Number DE88752956/JAW.

The Department of Farm Buildings at the Swedish University of Agricultural Sciences has built a combustion laboratory to improve the straw combustion systems together with the manufacturers. By practical tests, faults and bad constructions will be found. In the next phase the constructions will be improved together with the manufacturer to receive better reliability and combustion comfort. In the laboratory the variation of the fuel feeding is measured and how the furnace is interferred by different settings. The combustion air flow is measured as well as the output power. In the flue gases temperature, carbon dioxide, carbon monoxide, nitrogen monoxide and dust emissions are measured. (authors).

37409 **(STEV-FBT—88-10) Bioturbo report.** Tiberg, L. (Statens Energiverk, Stockholm (Sweden)). 8 May 1987. 24p. (In Swedish). NTIS (US Sales Only), PC A03. Order Number DE88753337/JAW.

The Bioturbo system is a pressurized boiler for wet solid fuels with means for condensing the water vapour in the flue gases. The compression of the flue gases is made by standard automotive turbochargers which are modified to suit the abnormal air/gas volume relationship of the system. The combustion takes place in a pressurized fluidized bed. The condensing cooling takes place at an intermediate pressure between the primary and the secondary turbine expansion. A number of basic investigations have been made. Different systems have been analysed. Efficiencies of available turbochargers have been investigated. A general computer program for the system was developed. Erosion of turbines and cyklones were investigated. It was found possible to avoid erosion with two cyklones in series before the turbine. Heat exchangers with condensing systems were calculated and tested. The corrosion situation of condensing systems was analysed. It was found possible to avoid corrosion by keeping surface temperatures below the water dew point. Gas cleaning efficiency was found to be much higher at expansion cooling than by contact cooling.

37410 **(STEV-FBT—88-13) Small-scale firing with firewood.** Amany, A.; Sylwan, C. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Chemical Technology). 1988. 38p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753339/JAW.

This investigation concerns circumstances which influence the quantities of unwanted emissions when firing in a smaller woodstove. The influence of the following factors was investigated: Configuration of the woodcharge, the use of different types of firebasket,the use of thermostat and catalyst and finally the method of ignition. The measured were burnrate, CO-emission, O2-content and temperature in the flue gas. The results show that the most favourable conditions were achieved with the logs standing tight on a firebasket of such configuration that falling logs would place themselves near the remaining standing logs. Furthermore high temperature proved favourable and so did the use of catalyst. The catalyst also need high temperature to function well. In order to achieve these high temperatures in an earlier stage of the firing we used thermal insulation of the fireplace. (authors).

37411 **(SVF—261) Steam jet heat pump for heat recovery from flue gases.** Lundqvist, P. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Apr 1987. 50p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752985/JAW.

A major part of the heat in the flue gases, especially when dealing with moisty combustibles, is regained when the moist is condensing, a temperature of 40-50 degrees C is required for the cooling agent. This implies that a heat pump is needed to lift heat energy to a more useful temperature level. This level, in this study, is assumed to be the temperature of returning water in a district heating system (70-80 degrees C) This study shows that a steam jet ejector system is a possible solution for heat recovery in flue gases. There are two major limiting factors: the maximum motive steam pressure that can be maintained in the boiler and the temperature in the district heating system. The type of fuel has a very strong influence on the possible profit with this kind of heat recovery system. A fuel with high water content, as biomass, gives flue gases containing a large amount of heat energy. In order to recover this a high efficiency ejector is required. An ejector is given high efficiency by using high pressure steam and by decreasing the temperature span between the evaporator and the condenser. A steam jet heat pump is an uncomplicated construction without moving parts. This gives it qualifications for reliability in running and a minimum of need for maintenance. Since the refrigerant and the cooling agent is water the environmental effects are insignificant. As disadvantegeous we find high intensity of noise and that it is rather bulky. This report shows that a biomass combustion plant on 1 MW needs a heat recovery system on approximately 200 kW cooling power. This is the size we suggest for a prototype steam jet heat pump.

37412 **(SVF—275) Joint combustion tests with coal powder and wood powder in an existing oil fired boiler plant.** Thaning, G. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Aug 1987. 35p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753347/JAW.

The trials were performed in an originally oil fired hot water boiler, which was converted into a boiler fuelled by coal powder. The series of tests involved 12 separate trials where each trial operated for two hours. The firing tests were carried out with the mixture proportions of 100/0 per cent, 67/33 per cent, 50/50 per cent, 33/67 per cent and 0/100 per cent, coal/wood powder expressed as heat equivalent percentage. Each test was carried through with an oil support but also without oil support in those cases this could be done. The interval of mixture for acceptable firing includes all the range from 100 per cent coal powder to 100 per cent wood powder. However, oil support was needed in the mixture interval between 33/67 per cent and 0/100 per cent coal/wood powder. A pronounced decrease of the Nosub(x) emission was obtained when the share of wood powder was increased in the mixture. It was reduced by 40 per cent from 0.21 g/MJ (100 per cent coal) to 0.13 g/MJ in a 50/50 per cent mixture and further to 0.10 g/MJ for a pure wood firing. The sulphur content of the flue gas decreased linearly with increasing wood powder addition, which could be expected as a result of the dilution effect. The sulphur content of wood powder is an order of magnitude less than that of coal powder. The sulphur emission was reduced from 0.24 g S/MJ (100 per cent coal) to 0.03 g S/MJ (100 per cent wood). In comparison with oil firing the rated output of the boiler was reduced from 9 MW to 8.4 MW (7 per cent) when a mixture of 50/50 per cent coal/wood powder was used in a full load test. The lowest load that was obtained with a steady flame for the same mixture was 5.2 MW. The amount of unburnt material in the ash varied from 18 per cent for a pure wood powder firing to 44 per cent for a 67/33 per cent coal/wood powder mixture. No increased fouling or slagging in the furnace was observed after completion of all the tests as compared to commercial coal powder firing.

37413 **(SVF—279) Secondary supply of wood and peat powder when firing coal powders. Investigation of the effect on NOsub(x) emission.** Rudling, L. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden); Studsvik Energiteknik AB, Nykoeping (Sweden)). Oct 1987. 105p. (In Swedish). (STUDSVIK-EP—87-4). NTIS (US Sales Only), PC A06. Order Number DE88752990/JAW.

The NOsub(x) reduction potential of pulverized wood and peat as reburning fuels during combustion of pulverized coal has been investigated. The experiments were carried out in a laboratory scale experimental furnace (diameter 0.3m, length 4m). The primary fuel flow of coal was 10 kg/h. As reburning fuel pulverized wood and peat was compared to propane. The results showed that pulverized wood gave almost the same NOsub(x) reduction as propane. For propane the emission was 85-90 mg NOsub(x)/MJ and for wood the emission was 90-95 mg NOsub(x)/MJ. Pulverized peat was somewhat less efficient than wood as reburning fuel with a NOsub(x)-emission of 140 mg/MJ. The difference is believed to be due to the higher nitrogen content of the peat.

37414 **Sealing apparatus utilizing a conformable member.** Neef, W.S.; Lambert, D.R. (to Dept. of Energy, Washington, DC). US Patent 4,735,421. 5 Apr 1988. Filed date 10 Aug 1982. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a sealing apparatus comprising: (a) housing means having a closed end and an open end and defining a single chamber therein; (b) at least one deformable means forming a substantially flat surface, and attached to the open end of the housing means in a manner to close the chamber; (c) apertured means positioned adjacent to the deformable means and secured to the housing means adjacent to but spaced from the open end for preventing substantial movement of the deformable means into the chamber; and (d) urging means including fluid pressure supply means operatively connected to the chamber for pressurizing the chamber and for deforming the deformable means outwardly from the chamber into contact with an associated surface to form a seal therebetween.

37415 (CONF-8609418—, pp 573-606) **Offshore foundations of the platform Schwedeneck.** Quast, P.; Salewski, J.; Wagner, P. (Grundbauingenieure Steinfeld und Partner, Hamburg (Germany, F.R.); Bilfinger und Berger A.G., Wiesbaden (Germany, F.R.)). 1986. (In German). NTIS (US Sales Only), PC A25/MF A01. Order Number DE88770212/JAW.

From Meeting and technical exhibition on construction foundations; Nuernberg, F.R. Germany (22 Sep 1986).

In 1983 the first German production platforms were installed in the oil field 'Schwedeneck-See', Baltic Sea. At the proposed locations a comprehensive soil investigation program was conducted. The liquefaction potential and the reduction of shear strength due to cyclic loading were of special importance. The essential construction stages and the foundation examinations are described.

37416 (DTH-ISVA-PR—65, pp 21-30) **Effect of Reynolds number on the in-line vibrations of pipelines.** Jensen, B.L. (Inst. Hydrodyn. and Hydraulic Engrg., Tech. Univ. (DK)). 1987. NTIS (US Sales Only), PC A04/MF A01.

In [Vibrations of Pipelines]. Progress report.

The equation of motion for the in-line movements of free spanning pipelines is solved for different values of the relevant parameters such as Reynolds number, Keulegan-Carpenter number, gap ratio etc. The results are presented in the form of series of diagrams, covering $10^4 < Re < 10^6$ and $10 < KC < 100$.

37417 **(NEI-DK—76) Suction anchors. Anchoring system for floating offshore structures.** Larsen, P. (Geoteknisk Inst., Lyngby (Denmark)). Jan 1988. 82p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752918/JAW.

This report deals with the use of suction anchors as an anchoring system for floating offshore constructions. Previous litterature and experience concerning the physical aspects of installation and load capacity during employment are evaluated, and a model-

test program is developed on this basis. The water flow conditions in the suction anchor and its influence on the down suction during installation are theoretically examined (finite element method); these results are compared with observations from down suction of model anchors as well as with available published information. Tests are at first carried out by subjecting the anchors to a static pull. Thereafter the tests are repeated under identical experimental conditions using a harmonically oscillating traction on the anchor. The purpose of this approach is to elucidate possible variation in horizontal ultimate bearing capacities between the two types of loads. Test results are given in the report in the form of load-displacement diagrams that illustrate relationships between applied horizontal force and horizontal displacements. It is evident from these diagrams that the estimated horizontal ultimate bearing capacity for suction anchors in sand is equally large for the two types of applied forces. Supplementary model tests have been carried out using an 0.1 m anchor in clay and kaolin. Load-displacement curves from these investigations show a clear difference in horizontal ultimate bearing capacity between the two types of stress. The ultimate bearing capacity for experiments conducted using oscillating load on suction anchors in clay and kaolin is estimated to be only half the ultimate bearing capacity for static load. 31 refs. (SM).

37418 **(NEI-NO—38) Telecommunications in connection with the offshore petroleum activity.** (Norsk Hydrologisk Komite, Oslo (Norway)). 1984. 233p. (In Norwegian). (CONF-8405446—). NTIS (US Sales Only), PC A11. Order Number DE88752841/JAW.

From Telecommunications in connection with the offshore petroleum activity; Kristiansand, Norway (28 May 1984).

The conference proceedings contain 19 papers. The topics covered are: Telecommunications in the North Sea; Who has the telecommunications engineering capacity? Concession obligation, obligatory equipment and technical requirements - the regulations of the Norwegian Telecommunications Administration; Loudspeaker and alarm installations on offshore platforms; Telephone systems and networks for offshore platforms; Satelitte communications to platforms - present day and in the future; The use of offshore microwave communications; Power supply plants for communications systems; Radio/TV entertainment installations; Telecommunication cables for offshore applications; Electric installations in areas with a danger of explosion; Fiber optics applications and possibilities offshore; Telecommunications net for STATPIPE; Data communications; New communications systems offshore. Separate abstracts were prepared for none of the papers of the proceedings.

37419 **(PB—88-186705/XAB) Low-flow-rate laboratory feeders for agglomerative particles.** Gullett, B.K.; Gillis, G.R. (Acurex Corp., Research Triangle Park, NC (USA)). 1987. 7p. NTIS, PC A02/MF A01.

Pub. in Powder Technology 52, 257-260(1987).

The paper describes two particle feeders (fluidizing and entrainment): one was developed by modifying a design used for coal-dust suspensions, and the other was developed later in response to shortcomings of the initial system. The two feeders were tested and compared for their performance at feeding $Ca(OH)_2$ sorbents. The development and operation of a particle feeder for laboratory-scale, gas/solid-flow reactors is crucial in many research efforts. On this small scale, it is particularly difficult to feed particles at high mass rates without quantities of carrier gas that disrupt the operation of the reactor. These problems have been encountered in research programs involving the injection of limestone-based sorbents into utility boilers for the removal of SO_2. The injection systems for these reactors must be designed to minimize the effects of the sorbent carrier gas upon the simulated utility-boiler environment.

37420 **(PB—88-191176/XAB) Industrial Combustion Emissions (ICE) model, Version 6.0. Software description. Final report, March 1985-February 1986.** Hogan, T. (Energy and Environmental Analysis, Inc., Arlington, VA (USA)). Feb 1988. 100p. NTIS, PC A05/MF A01.

For system on magnetic tape, see PB—88-172226.

This report describes the software of the Industrial Combustion Emissions (ICE) model, developed to support the EPA's analysis of acid-deposition control alternatives. The model projects industrial fossil-fuel-fired boiler fuels, air emissions, and costs by state for 1985, 1990, 1995, 2000, 2010, 2020, and 2030. The current base year in the ICE model (Version 3) is 1980. Fuels include natural gas, distillate and residual fuel oil, and coal. Air emissions include sulfur oxides, sulfates, and nitrogen oxides. The report describes the structure of the ICE model (Version 6.0) computer programs, its input and output data files, major internal variables and constants, and the use of comment statements in the model's source code for one of the subroutines. It does not provide the necessary Job Control Language to run the model.

37421 **Hot gas cross flow filtering module.** Lippert, T.E.; Ciliberti, D.F. (to Dept. of Energy, Washington, DC). US Patent 4,737,176. 12 Apr 1988. Filed date 12 Nov 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A filter module for filtering particulates from a mixture of particulates in a high temperature gas is described comprising: a duct having an interior space; filter elements; support mounts, means for securing the filter element to the upper surface of the support mount over the opening, and the filter elements each being supported on the inwardly directed rim of a respective support mount by engagement means which causes contact of the lower wall of a filter element with the rim.

37422 **Random control at n/sup 2/ points using n shakers.** Paez, T.L.; Smallwood, D.; Buksa, E. (Sandia National Labs., Albuquerque, NM (US)). pp 271-275 of Proceedings of the 33rd annual technical meeting of the institute of environmental sciences on environmental technology: Knowing the way. Mt. Prospect, IL; Institute of Environmental Sciences (1987). (CONF-870566—).

From Institute of Environmental Sciences annual meeting; San Jose, CA, USA (4 May 1987).

Until recently, random vibration tests performed in the laboratory were typically run using single-point control with the excitation generated using one vibration exciter. Recently, a method was developed for the coherent control of multiple vibration exciters. The method was implement at Sandia National Laboratories and has been used successfully. This new method for testing permits the simultaneous control of the autospectral density of motion at n points on a structure, and the cross-spectral density of motion between every pair of control points. It is shown in this paper that use of the present control technique also permits random vibration control of the autospectral density at n/sup 2/ points during an n-shaker test.

4250 Power Cycles

37423 **(CONF-880702—4) C-CAMP, A closed cycle alkali metal power system.** Wichner, R.P.; Hoffman, H.W. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 7p. (CONF-880702—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009715/JAW.

From 23. intersociety energy conversion engineering conference; Denver, CO, USA (31 Jul 1988).

A concept is presented for a Closed-Cycle Alkali Metal (C-CAMP) power systems which utilizes the heat of reaction of an alkali metal and halogen compound to vaporize an alkali metal turbine fluid for a Rankine cycle. Unique features of the concept are (1) direct contact (heat exchange) between the reaction products and turbine fluid, and (2) a flow-through chemical reactor/boiler. The principal feasibility issues of the concept relate to the degree of cross-mixing of product and turbine fluid streams within the reactor-boiler. If proven feasible, the concept may be adapted to a range of fuel and turbine fluids and ultimately lead to thermal efficiencies in excess of 35%.

37424 **(DOE/NASA/50112—74) Test results of a 40-kW Stirling engine and comparison with the NASA Lewis computer code predictions.** Allen, D.J.; Cairelli, J.E. (National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center; Sverdrup Technology, Inc., Cleveland, OH (USA)). 1985. Contract AI01-85CE50112. 14p. (NASA-TM—87050; CONF-850808—33). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008076/JAW.

From 20. intersociety energy conversion engineering conference; Miami Beach, FL, USA (18 Aug 1985).

A United Stirling 4-95 Stirling engine was tested without auxiliaries at the NASA Lewis Research Center. Three different regenerator configurations were tested with hydrogen. The test objectives were: (1) to obtain steady-state and dynamic engine data, including indicated power, for validation of an existing NASA Lewis computer model for that engine; and (2) to evaluate structurally the use of silicon carbide regenerators. This paper presents comparisons of the measured brake performance, indicated mean effective pressure (IMEP), and cyclic pressure variations, with those predicted by the code. The result of these NASA Lewis P-40 Stirling engine tests can be summarized: 1. The computer code developed at NASA Lewis did predict, with reasonable accuracy, the performance of the engine throughout the range of operating points tested. In particular, the predicted brake power and brake efficiency agreed quite well with the standard and part-power regenerator data. 2. IMEP trends for the code followed the actual measured curves as observed from the MEIS system. The measured IMEP data was consistently lower than the predicted values. 3. Measured dynamic pressures are similar amplitude and an apparent phase shift.

(Fermi National Accelerator Lab., Batavia, IL (USA)). Feb 1988. Contract AC02-76CH03000. 11p. (CONF-870950—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008054/JAW.

From 14. annual National Energy Division of the American Society of Quality Control conference; Las Vegas, NV, USA (14 Sep 1987).

After a brief description of the goal of Fermi National Accelerator Laboratory (Fermilab) this paper poses and answers three questions related to Quality Assurance (QA) at the Laboratory. First, what is the difference between 'orthodox' and 'unorthodox' QA and is there a place for 'orthodox' QA at a laboratory like Fermilab? Second, are the deeper philosophical and cultural frameworks of high-energy physics acommodating or antagonistic to an 'orthodox' QA Program? Finally, faced with the task of developing an institutional QA program for Fermilab where does one begin? The paper is based on experience with the on-going development and implementation of an institutional QA Program at Fermilab. 10 refs.

37426 **(Juel-Spez—416) Introduction to the accelerator techniques for synchrotrons and storage rings.** Martin, S.; Richert, A.; Sobotta, K. (comps.). (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.)). Sep 1987. 121p. (In German). (CONF-8610412—). Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

From COSY seminar; Simonskall, F.R. Germany (31 Oct 1986).

This report includes the manuscripts of the papers presented at the training seminar on COSY techniques. Lectures on the fundamentals and discussion sessions of specialists took place under seclusion, covering the main topics magnet technology, power supply, instrumentation, and rf and diagnosis at COSY. With the experts from CERN, SIN, GSI, MPI, and BESSY existing solutions for COSY were discussed as well as criticized, and technical improvements were elaborated. (orig./HSI).

37427 **(BNL—41333) Status of the Alternating Gradient Synchrotron (AGS) upgrade project.** Sluyters, T. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 4p. (CONF-880695—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011621/JAW.

From 1. European particle accelerator conference; Rome, Italy (7 Jun 1988).

The upgrade of BNL's Alternating Gradient Synchrotron progresses parallel with the construction of the 1.5 GeV Booster with a view to completion of its major components in 1991. The initial goals of the upgrade program are: to prepare the AGS ring for acceleration of at least 5 {times} 10^{13} protons per pulse, to accelerate heavy ions up to gold, to accelerate polarized protons in the 10^{12}-10^{13} intensity range, and to improve the reliability and flexibility of the present machine operation. Figure 1 shows the AGS complex as it will operate in 1991. There are several major systems in the AGS complex which have to be upgraded in order to accelerate the higher intensity beams and heavier ions. These systems are: the RFQ preinjector, the rf cavities, the vacuum, the transverse dampers, the correction magnets, extraction equipment, and the Siemens main magnet power supply. Additional major projects, which will keep the ring activation within {open←quotes}acceptable{close←quotes} limits despite a four-fold increase in beam intensity, are a fast beam chopper, a gamma-transition jump system, and a high frequency dilution cavity. These last projects have received high priority because they benefit as well the present operation of the AGS.

37428 **(LA—11265-MS) Design of high-power radio-frequency drive loops for operation into 425-MHz linear accelerators.** Liska, D.; Dauelsberg, L. (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 20p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010305/JAW.

Recent designs for ultra high-frequency (UHF) band accelerators have prompted the need for high-powered drive loops compatible with the peak and average power needs of the accelerator tanks. Two such loops have ben developed in the Accelerator Technology (AT) Division at Los Alamos and are now part of the general accelerator inventory. One loop is of small size, appropriate for radio-frequency quadrupole (RFQ) injector-accelerators, and is rated at 500-kW peak, 2-ms pulse length and 5% duty factor. The other loop is a 1-MW design, physically larger, also rated at 2-ms pulse length and 5% duty factor. The 1-MW drive loop uses a flat-disk ceramic window. The 500-kW loop as developed can use either a flat disk window or a special $\lambda 2$ window module available from Oak Ridge National Laboratory (ORNL). The purpose of this note is to describe the design of these loops and the tests performed on them so that they might be used by design engineers with appropriate applications.

37429 **(RI—194) Neutron flux generation of the cyclotron MGTs-20.** Nemilov, Yu.A.; Selitskij, Yu.A.; Funshtejn, V.B.; Khlebnikov, S.V. (Radievyj Inst., Leningrad (USSR)). 1987. 37p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702952/JAW.

Analysis of reactions for production of monoenergetic neutrons and neutrons of continuous energy spectrum on the cyclotron MGTs-20 is performed. Neutron fluxes are calculated. Optimum irradiation conditions and target materials for production of intensive fluxes of monoenergetic neutrons with low neutron background are recommended. 35 refs.; 23 figs.; 6 tabs.

37430 **(SAND—87-3007C) Long-pulse, high-power vircator experiments.** Coleman, P.D.; Aurand, J.F. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 11p. (CONF-8805132—6). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011787/JAW.

From 4. national high power microwave conference; Monterey, CA, USA (9 May 1988).

An experiment designed to achieve long pulse virtual cathode oscillator (VCO) operation at ~ 700 MHz is described. Low frequency operation allowed operating at large A-K gaps and low current densities which facilitated the 800 ns pulsewidth operation. The VCO was configured in a 91 cm diameter drift tube and consisted of a 76 cm diameter planar cathode separated from an anode screen by an A-K gap that was varied from 5 to 10 cm. The diode was directly driven by a Marx generator with a resultant A-K voltage of 350 kV. Power was extracted axially from the cylindrical waveguide through a Lexan window. Application of a transverse magnetic field downstream of the virtual cathode swept the beam into the wall. This method of dumping the beam avoided plasma formation at the window and a resultant shortening of the radiated pulse. The frequency was observed to chirp from 600 to 800 MHz. The radiation pattern was measured by a seven element B-dot array located 2.4 m from the exit window. Comparison of these patterns to computer code predictions indicated a mix of TM_{01} and TM_{02} modes.

37431 **(SLAC—327) Health physics manual of good practices for accelerator facilities.** Casey, W.R.; Miller, A.J.; McCaslin, J.B.; Coulson, L.V. (Stanford Linear Accelerator Center, Menlo Park, CA (USA); Brookhaven National Lab., Upton, NY (USA); Los Alamos National Lab., NM (USA); Lawrence Berkeley Lab., CA (USA); Fermi National Accelerator Lab., Batavia, IL (USA)). Apr 1988. Contract AC03-76SF00515. 140p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88010816/JAW.

It is hoped that this manual will serve both as a teaching aid as well as a useful adjunct for program development. In the context of application, this manual addresses good practices that should be observed by management, staff, and designers since the achievement of a good radiation program indeed involves a combined effort. Ultimately, radiation safety and good work practices become the personal responsibility of the individual. The practices presented in this manual are not to be construed as mandatory rather they are to be used as appropriate for the specific case in the interest of radiation safety. As experience is accrued and new data obtained in the application of this document, ONS will update the guidance to assure that at any given time the guidance reflects optimum performance consistent with current technology and practice.The intent of this guide therefore is to: define common health physics problems at accelerators; recommend suitable methods of identifying, evaluating, and managing accelerator health physics problems; set out the established safety practices at DOE accelerators that have been arrived at by consensus and, where consensus has not yet been reached, give examples of safe practices; introduce the technical literature in the accelerator health physics field; and supplement the regulatory documents listed in Appendix D. Many accelerator health physics problems are no different than those at other kinds of facilities, e.g., ALARA philosophy, instrument calibration, etc. These problems are touched on very lightly or not at all. Similarly, this document does not cover other hazards such as electrical shock, toxic materials, etc. This does not in any way imply that these problems are not serious. 160 refs.

37432 **(UCRL—97216) The two-beam accelertor.** Sessler, A.M.; Hopkins, D.B. (Lawrence Livermore National Lab., CA (USA)). Aug 1987. Contract W-7405-ENG-48. 7p. (CONF-870632—15). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011352/JAW.

From International Europhysics conference on high energy physics; Uppsala, Sweden (25 Jun 1987).

The Two-Beam Accelerator (TBA) consists of a long high-gradient accelerator structure (HGS) adjacent to an equal-length Free Electron Laser (FEL). In the FEL, a beam propagates through a long series of undulators. At regular intervals, waveguides couple microwave power out of the FEL into the HGS. To replenish energy given up by the FEL beam to the microwave field induction accelerator units are placed periodically along the length or the FEL. In this manner it is expected to achieve gradients of more than 250 MV/m and thus have serious option for a 1 TeV {times} 1 TeV linear collider. The state of present theoretical understanding of the TBA is presented with particular emphasis upon operation of the "steady-state" FEL, phase and amplitude control of the rf wave, and suppression of sideband instabilities. Experimental work has focused upon the development of a suitable HGS and the testing of this structure using the Electron Laser Facility (ELF). Description is given of a first test at ELF with a seven-cell $2\pi/3$ mode structure which without pre-conditioning and with a not-very-good vacuum nevertheless at 35 GHz yielded an average accelerating gradient of 180 MV/m.

37433 **A scientific workstation operator-interface for accelerator control.** Paxson, V.; Jacobson, V.; Theil, E.; Lee, M.; Clearwater, S. (Lawrence Berkeley Lab., Berkeley, CA 94720 (US)). pp 556-558 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—). Contract AC03-76SF00098;AC03-76SF00515.

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Research in human factors has demonstrated that people use computers more efficiently and effectively if they have a highly visual interface to the machine. Today's scientific workstations provide sufficient power to implement such interfaces. By using these workstations, an operator interface for an accelerator control system can be built which is powerful, flexible, and easy to learn. The authors discuss such a system currently being developed on a Sun-3 workstation. The system is designed as a set of building blocks which can be run independently or linked together. This toolbox approach gives the operator the ability to execute precisely those programs needed for the task at hand. Each program runs in a separate window and communicates with other running programs via a common data base. When the operator makes a change in one window, the effects are then shown in the other windows.

37434 **Some applications of AI to the problems of accelerator physics.** Higo, T.; Shoaee, H.; Spencer, J.E. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 701 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Failure of orbit correction schemes to recognize betatron oscillation patterns obvious to any machine operator is a good problem with which to analyze the uses of Artificial Intelligence and the roles and relationships of operators, control systems and machines. Because such error modes are very common, their generalization could provide an efficient machine optimization and control strategy. A set of first-order, unitary transformations connecting canonical variable through measured results are defined which can either be compared to design for commissioning or to past results for 'golden orbit' operation. Because these relate directly to hardware variables, the method is simple, fast and direct. It has implications for machine design, controls, monitoring and feedback. Chronological analysis of such machine signatures can predict or provide a variety of information such as mean time to failure, failure modes and fast feedback or feedforward for optimizing figures of merit such as luminosity or current transmission. The use of theoretical and empirical scaling relations for such problems is discussed in terms of various figures of merit, the variables on which they depend as well as their functional dependences.

37435 **Programmable master-timer system.** Potter, J.M.; Barnes, M.L.; Bjorklund, E.A. (Los Alamos National Lab., Los Alamos, NM (US)). pp 628-630 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The Clinton P. Anderson Meson Physics Facility (LAMPF) master-timer system provides a 96-channel timing solution of programmable signals and eight predefined system signals required for accelerator operation. Each signal may differ in delay, length, and rate of repetition. Timing solutions are calculated in the LAMPF

central control computer, a VAX 11/780, and down-loaded to the master-timer computer, a μVAX-II. The one second timing solution consists of 120 macropulses synchronized to the zero crossing of the ac line. The output signal resolution is one microsecond. This CAMAC-based system is implemented in a dual configuration to ensure versatility and reliability. Each subsystem provides two, 96-channel timing solutions. Any of the four master-timer solutions can be loaded, verified, and then synchronously selected. If the μVAX-II discovers a timing error during self-testing, it automatically switches to a valid solution. Once loaded, the system will continue to run without computer intervention. The master-time system has the capability of local control and of displaying current status information. Adaptability, reliability, and self-testing assure that the LAMPF master-timer system will keep pace with future requirements.

37436 **Present and future superconducting linacs.** Bollinger, L.M. (Argonne National Lab., Argonne, IL (US)). pp 233-238 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

This paper is a survey of superconducting linacs designed for heavy-ion acceleration and a brief discussion of future prospects. Eight such machines are in operation or under construction, and others are being planned. Most of these linacs function as energy boosters for ions from tandem electrostatic accelerators and are designed to provide output beams or relatively low energy but very good quality. The short independently-phased accelerating structures of the linacs involved in these tandem-linac systems cover the velocity range $0.4 \leq \beta \leq 0.3$. In a recent development, the technology is being extended down to ions with $\beta < 0.01$ in order to eliminate the need for the tandem injector. The main design features of the various heavy-ion linacs are summarized, and differences from superconducting linacs for electron acceleration are noted.

37437 **Collective acceleration of protons by the plasma waves in a counterstreaming electron beam.** Yan, Y.T. (Applied Theoretical Physics Div., Los Alamos National Lab., Los Alamos, NM (US)). pp 175-177 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

A novel advanced accelerator is proposed. The counterstreaming electron beam accelerator relies on the same physical mechanism as that of the plasma accelerator but replaces the stationary plasma in the plasma accelerator with as magnetized relativistic electron beam, drifting antiparallel to the driving source and the driven particles, as the wave supporting medium. The plasma wave in a counterstreaming electron beam can be excited either by a density-ramped driving electron beam or by properly beating two laser beams. The fundamental advantages of the counterstreaming electron beam accelerator over the plasma accelerator are a loner and tunable plasma wavelength, a longer pump depleting length or a larger transformer ratio, and easier pulse shaping for the driving source and the driven beam. Therefore, the energy gain of the driven particles can be greatly enhanced whereas the trapping threshold can be dramatically reduced, thus admitting the possibility for proton acceleration.

37438 **Modifications to the SSC lattice.** Garren, A.A.; Johnson, D.E. (SSC Central Design Group, c/o Lawrence Berkeley Lab., Berkeley, CA (US)). pp 163-165 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Possible modifications of the lattice described in the Superconducting Super Collider Conceptual Design Report of March 1986 have been considered and are presented below. One potential modification to the lattice is to change the arc cells in betatron phase advance from 60° t 90°, and to lengthen them to include six rather than five dipoles per half cell. Another related change is to make the dispersion suppressors shorter, and to include longer drift spaces for scrapers and detectors.

37439 **Antiproton acceleration in the Fermilab Main Ring and Tevatron.** Martin, P.; Dinkel, J.; Ducar, R.; Kerns, C.; Kerns, Q.; Meisner, K.; Miller, H.W.; Reid, J.; Tawzer, S.; Wildman, D. (Fermi National Accelerator Lab., P.O. Box 500, Batavia, IL (US)). pp 47-49 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The operation of the Fermilab Main Ring and Tevatron rf systems for colliding beams physics is discussed. The changes in the rf feedback system required for acceleration of antiprotons, and the methods for achieving proper transfer of both protons and antiprotons are described. Data on acceleration and transfer efficiencies are presented.

37440 **Rf-driver linear colliders.** Wilson, P.B. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 53-58 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The next generation of linear collider after the SLC (Stanford Linear Collider) will probably have an energy in the range 300 GeV-1 TeV per linac. A number of exotic accelerating schemes, such as laser and plasma acceleration, have been proposed for linear colliders of the far future. However, the technology which is most mature and which could lead to a collider in the above energy range in the relatively near future is the rf-driven linac, in which externally produced rf is fed into a more or less conventional metallic accelerating structure. Two basic technologies have been proposed for producing the required high peak rf power: discrete microwave power sources, and various two-beam acceleration schemes in which the rf is produced by a high current driving beam running parallel to the main accelerator. The current status of experimental and analytic work on both the discrete source and the two-beam methods for producing rf are discussed. The implications of beam-beam related effects (luminosity, disruption and beamstrahlung) for the design of rf-driven linear colliders are also considered.

37441 **Non-plasma based advanced methods of acceleration.** Siemann, R.H. (Accelerator Div., Fermi National Accelerator Lab., Batavia, IL (US)). pp 59-62 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The development of advanced acceleration mechanisms provide new capabilities for science. At the present time, discussions are centered on particle physics where advanced accelerators are the only route to electron-positron collisions at energies significantly above that of LEP. Cost effectiveness in this application leads to requirements which can be stated roughly as: i. high acceleration gradient for a reasonable length machine, ii. small transverse emittances for a small collision spot, iii. small longitudinal emittance to minimize chromatic aberrations while working in the quantum beamstrahlung regime, iv. stable, reproducible operation. These requirements may be unique, and an acceleration technique inappropriate for this may be suitable in some other application. However, since end-use requirements have an important influence and these have been enumerated only for high energy linear colliders, this paper concentrates on advanced accelerators for particle physics. In a linear collider the beam power, center-of-mass energy, luminosity,

and beamstrahlung parameter fix the longitudinal and transverse beam dimensions, the collision frequency, and number of particles. The accelerator must be designed to minimize costs while reaching the needed energy with the needed beam quality.

37442 **Overview of plasma based accelerating schemes.** Clayton, C.E. (Univ. of California, Los Angeles, Los Angeles, CA (US)). pp 63-67 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The group of accelerator concepts which exploit the ability of plasma to support extremely high electric fields are reviewed here. The topic of Plasma Accelerators is introduced by a general discussion of the relativistic plasma waves which provide the accelerating structure for the two most studied plasma accelerator concepts; namely, the Beatwave and Wakefield Accelerators. Some recent results on beam loading, extraction efficiency, and emittance growth in these structures are also discussed. Current research highlights in the several accelerator concepts will be presented as well as some other uses for plasma in the accelerator field such as plasma lenses and plasma wigglers.

37443 **An advanced hadron facility: A combined kaon factory and cold-neutron source.** Thiessen, H.A. (Los Alamos National Lab., Los Alamos, NM (US)). pp 86-89 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The authors present a concept for an advanced hadron facility consisting of a combined kaon factory and second generation spallation source. The authors' concept consists of a 1.2 GeV superconducting H/sup -/ afterburner to bring the LAMPF energy up to 2 GeV, a multi-ring 2 GeV compressor, a shared cold-neutron and stopped-pion neutrino source, a 60 GeV 25 μAmp 6 Hz proton synchrotron, and kaon and proton experimental areas. The authors discuss the considerations which led to this concept. The authors summarize recent results of r and d work on components for rapid-cycling synchrotrons. Finally, they mention briefly the possibilities for a pion linac at LAMPF.

37444 **(ANL-HEP-CP—88-17) Commissioning of polarized-proton and antiproton beams at Fermilab.** Yokosawa, A. (Argonne National Lab., IL (USA)). 4 May 1988. Contract W-31-109-ENG-38. 6p. (CONF-880399—4). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012045/JAW.

From 23. Rencontre de Moriond: current issues in hadron physics; Les Arcs, France (13 Mar 1988).

The author described the polarized-proton and polarized-antiproton beams up to 200 GeV/c at Fermilab. The beam line, called MP, consists of the 400-m long primary and 350-m long secondary beam line followed by 60-m long experimental hall. We discuss the characteristics of the polarized beams. The Fermilab polarization projects are designated at E-581/704 initiated and carried out by an international collaboration, Argonne (US), Fermilab (US), Kyoto-Kyushu-Hiroshima-KEK (Japan), LAPP (France), Northwestern University (US), Los Alamos Laboratory (US), Rice (US), Saclay (France), Serpukhov (USSR), INFN Trieste (Italy), and University of Texas (US).

37445 **(BNL—41328) Effect of coupling on intrabeam scattering.** Parzen, G. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 3p. (CONF-880695—7). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012141/JAW.

From 1. European particle accelerator conference; Rome, Italy (7 Jun 1988).

The effect of coupling between horizontal and vertical betatron oscillations on the growth of a beam due to a intrabeam scattering has been studied. It was suggested that the presence of coupling may reduce the effects of intrabeam scattering. A procedure is outlined for revising intrabeam scattering theory to include coupling. There is one case where a plausible solution is not difficult to find, and this is the case of complete coupling. In this case, although coupling reduces the initial horizontal growth rate by a factor of 2, the final size of the beam after many hours is reduced by about 15%. An invariant is found that relates the energy spread and the transverse beam size that is valid at high energies and for the case of complete coupling.

37446 **(BNL—41360) Nonlinear synchrotron motion near transition energy in RHIC.** Lee, S.Y.; Wei, J. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 4p. (CONF-880695—6). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012142/JAW.

From 1. European particle accelerator conference; Rome, Italy (7 Jun 1988).

A tracking program to study the nonlinear effect of the longitudinal motion for particles in the circular accelerator has been written. When the RF voltage $V_0 = 1.2$ MV is used, we find that $\gamma_{sub\ T}$ jump, $\gamma_{sub\ T}$ or faster acceleration rate, γ is needed in RHIC. The simulation result can be understood analytically via the nonlinear equation of motion. For the $\gamma_{sub\ T}$ jump scheme, there is little bunch shape dilution or deformation in the transition energy crossing. At a bunch area of 0.3 ev-sec/amu, $\Delta\gamma_{sub\ T} = 0.6$ in 30 msec is satisfactory to eliminate the beam loss and preserve the bunch area. By manipulating the momentum aperture, γ can be increased substantially at the transition energy region. To eliminate beam loss, +/- 0.8% of momentum aperture is needed. On the other hand, when the RF voltage is reduced to 100KV, while maintaining the same acceleration rate, the bunch survival rate across the transition energy is dramatically increased. This is resulted from both smaller momentum spread and longer adiabatic time at the transition energy region due to the smaller voltage.

37447 **(BNL—41363) Beam-beam interactions and luminosity considerations in RHIC.** Rhoades-Brown, M.J. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 4p. (CONF-880695—8). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012138/JAW.

From 1. European particle accelerator conference; Rome, Italy (7 Jun 1988).

The performance of the RHIC machine is largely determined by the intrabeam scattering process. However, beam-beam interactions due to both nuclear scattering and intrinsic Coulomb excitation of the heavy ions will result in beam loss and luminosity reductions. The transverse electric field, responsible for Coulomb excitation, is multiplied by a Lorentz Gamma factor at relativistic energies. For ^{197}Au beams in RHIC (Lab. Frame) this factor is 108. Once Coulomb excitation has occurred, the nucleus may fragment or emit a proton, and thus be lost from the beam. Estimates of the beam lifetime will be presented, based on perturbative calculations for the Coulomb excitation process. In addition, di-lepton production from the enormous transverse electric field will be discussed and related to the more general luminosity questions.

37448 **(CONF-880601—8) The modified high-energy transport code, HETC, and design calculations for the SSC [Superconducting Super Collider].** Alsmiller, R.G. Jr.; Alsmiller, F.S.; Gabriel, T.A.; Hermann, O.W.; Bishop, B.L. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88004483/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

The proposed Superconducting Super Collider (SSC) will have two circulating proton beams, each with an energy of 20 TeV. In order to perform detector and shield design calculations at these higher energies that are as accurate as possible, it is necessary to incorporate in the calculations the best available information on

differential particle production from hadron-nucleus collisions. In this paper, the manner in which this has been done in the High-Energy Transport Code HETC will be described and calculated results obtained with the modified code will be compared with experimental data. 10 refs., 1 fig.

37449 **(ENEA-RT-TIB—87-35) Analytical treatment of the FEL pulse dynamics in the long bunch limit. Pt III.** Dattoli, G.; Torre, A.; Mezi, L.; Gallardo, J.C. (ENEA, Frascati (Italy). Centro Ricerche Energia; Brookhaven National Lab., Upton, NY (USA)). (ENEA, Rome (Italy)). 1987. 19p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702852/JAW.

The FEL pulse dynamics is investigated in terms of stationary solutions of super mode type. A fully analytical investigation is carried out and it is shown that, within the approximation of long bunch limit, FEL super modes realize a biorthogonal basis. The relevance of this result to treat the optical field evolution with a preinjected signal or higher order perturbation is also discussed. Finally it is shown that the present analytical method is in very good agreement with previous numerical predictions.

37450 **(IFVE-OUNK—87-71) Effect of synchrotron beam parameters on the spectrum of its electromagnetic radiation in nonuniform magnetic field.** Smolyakov, N.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702862/JAW.

Submitted to the journal Zh. Tekh. Fiz. .

The dipole electromagnetic radiation of a beam in the synchrotron passing through the rapid azimuthally nonuniform magnetic field is studied. The spectral density of the radiation is shown to be greater for the particles moving nearer to the magnetic system poles. The nature of a such growth of the spectral-angular density of radiation is found to be independent of the certain type of the plane magnetic system (short magnets, dipole magnet edge, plane ondulator). The formula for spectral-angular raiation density versus particles transverse coordinate is obtained. Some features of the beam transverse profile diagnostics by means of beam radiation in ondulator fields and short magnets are analysed. 25 refs.; 1 fig.

37451 **(INFN-LNF—88-04(R)) Infrared free electron laser on the superconducting linac LISA.** Castellano, M. (Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati). (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1988. 12p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702864/JAW.

The main parameters of a Free Electron Laser covering the infrared wavelength region and using the high quality electron beam produced by the Superconducting Linac LISA in development at the Frascati National Laboratories are breafly reviewed. Some considerations of the effects of the FEL interaction on a possible electron beam energy recover are also presented.

37452 **(JINR—R-9-87-268) Calculations of high-frequency parameters of disc-loaded waveguides.** Kaschiev, M.S.; Mamonov, V.N.; Obukhov, Yu.L.; Reshetnikova, K.A.; Rubin, S.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1987. 11p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702178/JAW.

Radio-technical parameters of a disc-loaded waveguide suitable for modeling two-beam acceleration are designed. Two series of calculations using the finite element method (MULTIMODE program) and restricted region method (ALF program) lead to coinciding resonance frequencies for rectangular-disc waveguide. The MULTIMODE program package is also used for the numerical simulation of the rounded-edge-disc waveguide, the field distribution picture and several energy parameters of the designed system. 10 refs.; 6 figs.; 4 tabs.

37453 **(JINR-R—11-87-349) On an approach to solving the charged particle motion differential equations in synchrotron.** Yudin, I.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 8p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702939/JAW.

Submitted to the Organizing Committee of All-Union Conference New approach to differential equation solution, Drogobych, 17 - 21 May 1987.

A numercial solution of a system of differential equations describing transverse (betatron) oscillations of charged particles when they pass through a bending magnet which field contains, besides the dipole component, the amplitude of 3th, 5th and 7th Fourier harmonics is obtained with a high accuracy by means of constructed the Runge-Kutta type algorithm of the 5th order. An analytical dependence of the obtained numerical solution (final phase coordinates x/sub K/, x'/sub K/, y/sub K/, y'/sub K/) upon the initial phase coordinates and magnetic field parameters is proposed. Program realization of the proposed method for solving differential equations of charged particle motion in the accelerator-synchrotron is developed. 14 refs.; 3 figs.; 1 tab.

37454 **(LA-UR—88-1476) Performance of the Los Alamos expanding telescope.** Dombeck, T.W. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 16p. (CONF-880695—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010924/JAW.

From 1. European particle accelerator conference; Rome, Italy (7 Jun 1988).

An expanding telescope can produce a very low divergence particle beam, provided that the beam optics have sufficient quality in order not to introduce large aberrations. Even as late as two years ago there were no theoretical beamline codes, and little experimental work that could describe the third-order aberrations introduced by an expanding telescope. A project was undertaken at Los Alamos National Laboratory to perform these calculations, and to build a telescope to confirm the predictions. It was installed at Argonne National Laboratory during the summer of 1987 and tested in a 50 MeV H/sup {-/} beam. The telescope consisted of a singlet eyepiece and triplet objective lens with a twenty times magnification. It performed to the design specifications of twenty-five micro-radians beam divergence with a parallel beam focus. The measured geometric aberrations were found to be in agreement with the computer calculations.

37455 **(LA-UR—88-1544) PARMILA [Phase And Radial Motion In Linear Accelerators]: An introduction.** Boicourt, G.P. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 23p. (CONF-880178—2). NTIS, PC A03;3. Order Number DE88011050/JAW.

From Workshop on accelerator and beam optics codes; San Diego, CA, USA (19 Jan 1988).

This is a tutorial overview of the PARMILA drift-tube linac beam-dynamics code. First discussed are what PARMILA is and what it is used for. Its origins are discussed. What PARMILA does and how it does its tasks are described. One of the major uses of PARMILA is for the evaluation of effects produced by errors in construction and deviations from design operating conditions. In this connection, a few words are said about what errors PARMILA is able to handle. A section on user friendliness is followed by a few words on the code's accuracy. Finally, some options and improvements are proposed.

37456 **(LA-UR—88-1545) Moment invariants for particle beams.** Lysenko, W.P.; Overley, M.S. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 14p. (CONF-880178—7). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011052/JAW.

From Workshop on accelerator and beam optics codes; San Diego, CA, USA (19 Jan 1988).

The rms emittance is a certain function of second moments in 2-D phase space. It is preserved for linear uncoupled (1-D) motion. In this paper, the authors present new functions of moments that are invariants for coupled motion. These invariants were computed symbolically using a computer algebra system. Possible

applications for these invariants are discussed. Also, approximate moment invariants for nonlinear motion are presented.

37457 (LA-UR—88-1690) Multipole correction in large synchrotrons. Neuffer, D. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 14p. (CONF-8804111—2; CONF-8804111—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010949/JAW.

From 2. ICFA advanced beam dynamics; Lugano, Switzerland (11 Apr 1988).

A new method of correcting dynamic nonlinearities due to the multipole content of a synchrotron such as the Superconducting Super Collider is discussed. The method uses lumped multipole elements placed at the center (C) of the accelerator half-cells as well as elements near the focusing (F) and defocusing (D) quads. In a first approximation, the corrector strengths follow Simpson's Rule. Correction of second-order sextupole nonlinearities may also be obtained with the F, C, and D octupoles. Correction of nonlinearities by about three orders of magnitude are obtained, and simple solutions to a fundamental problem in synchrotrons are demonstrated. Applications to the CERN Large Hadron Collider and lower energy machines, as well as extensions for quadrupole correction, are also discussed.

37458 (LA-UR—88-1734) Coupled-bunch instabilities in RHIC. Colton, E.; Gianfelice, E.; Bisognano, J. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 15p. (CONF-880335—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010931/JAW.

From Workshop on the relativistic heavy ion collider performance; Upton, NY, USA (21 Mar 1988).

We used the program ZAP to evaluate the coupled-bunch modes for the case of 57 equally spaced bunches with the Sacherer-Zotter formalism assuming parabolic bunches. The sources of coupling impedances assumed were space charge, resistive wall, broadband, and rf cavity fundamental and parasitic modes. Generally the studies assumed a stainless steel vacuum chamber, but we did perform a comparison run using a stainless steel chamber internally coated with a thin cold copper layer. These latter investigations were motivated by the proposal for coating which would reduce parasitic wall heating in the vacuum chambers in the superconducting dipoles. 10 tabs.

37459 (LBL—24519) Heavy ion fusion accelerator research (HIFAR) year-end report, April 1, 1987-September 30, 1987. (Lawrence Berkeley Lab., CA (USA)). Dec 1987. Contract AC03-76SF00098. 33p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008464/JAW.

The basic objective of the Heavy Ion Fusion Accelerator Research (HIFAR) program is to access the suitabilty of heavy ion accelerators as igniters for Inertial Confinement Fusion (ICF). A specific accerelator techonolgy, the induction linac, has been studied at the Lawerence Berkeley Laboratory and has reached the point at which its viability for ICF applications can be assessed over the next few years. The HIFAR program addresses the generation of high-power, high-brightness beams of heavy ions, the understanding of the scaling laws in this novel physics regime, and the vadidation of new accelerator strategies, to cut costs. The papers in this report that address these goals are: MBE-4 mechanical progress, alignment of MBE-4, a compact energy analyzer for MBE-4, Cs^+ injector modeling with the EGUN code, an improved emittance scanning system for HIFAR, 2-MV injector, carbon arc source development, beam combining in ILSE, emittance growth due to transverse beam combining in ILSE - particle simulation results, achromatic beam combiner for ILSE, additional elements for beam merging, quadrupole magnet design for ILSE, and waveforms and longitudinal beam-parameters for ILSE.

37460 (UUIP—1139) Manual to the MAXRAY program library for reflective and dispersive ray tracing. Svensson, S.; Nyholm, R. (Uppsala Univ. (Sweden). Inst. of Physics). Jul 1985. 68p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752513/JAW.

A general ray tracing program package for reflective and dispersive X-ray optics is described. The package consists of a number of subroutines written in FORTRAN 77 code giving the necessary tools for ray tracing. The program package is available on request from the authors. (authors).

37461 Experimental observation of plasma wake-field acceleration. Rosenzweig, J.B.; Cline, D.B.; Cole, B.; Figueroa, H.; Gai, W.; Konecny, R.; Norem, J.; Schoessow, P.; Simpson, J. (High Energy Physics Division, Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review Letters;* **61**: No. 1, 98-101(4 Jul 1988).

We report the first experimental test of the physics of plasma wake-field acceleration performed at the Argonne National Laboratory Advanced Accelerator Test Facility. Megavolt-per-meter plasma wake fields are excited by an intense 21 MeV, multipiscosecond bunch of electrons in a plasma of density n/sub e/≃10/sup 13/ cm/sup -3/, and probed by a low-intensity 15-MeV witness pulse with a variable delay time behind the intense bunch. Accelerating and deflecting wake-field measurements are presented, and the results compared to theoretical predictions.

37462 Parametric growth of space charge waves using a self-biased electrostatic wiggler. Anselmo, A.; Nation, J.A. (Laboratory of Plasma Studies and School of Electrical Engineering, Cornell University, Ithaca, New York 14853-5401). *Physics of Fluids;* **31**: No. 7, 2037-2046(Jul 1988).

An investigation is reported on the use of parametric scattering from an electrostatic wiggler for the growth of space charge waves. This investigation extends previous work on slow space charge wave generation and propagation in inhomogeneous waveguides. Observations show that the scattering technique may be used for the growth of large amplitude waves and that this technique permits wave growth at all values of interest for the ratio of beam to limiting current.

37463 Monitoring the beam position in the SLC interaction region. Denard, J.C.; Bowden, G.B.; Oxoby, G.J.; Pellegrin, J.L.; Ross, M.C. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 686-688 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The Stanford Linear Collider requires special Beam Position Monitors near the Interaction Point (IP) to bring the two beams (e/sup +/ and /sup e-/) into collision. These beams pass through two monitors on each side of the IP with a short time separation (about 20 and 50ns). The mechanics of the monitors as well as the electronics will be described. In order to bring beams of several microns diameter into collision at the IP, these monitors measure beam deflection induced by the presence of the opposite beam.

37464 Performance of wire scanner beam profile monitors to determine the emittance and position of high power CW electron beams of the NBS-Los Alamos racetrack microtron. Cutler, R.I.; Owen, J.; Whittaker, J. (National Bureau of Standards, Gaithersburg, MD (US)). pp 625-627 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The NBS-LANL Race Track Microtron (RTM) injector produces a sub-millimeter diameter, 600 μA, 5 MeV CW electron beam. In order to steer and focus this electron beam and to measure its emittance and energy spread, a system of wire scanner beam profile monitors has been developed. Three wire scanners are mounted in a straight line with approximately one meter spacing for emittance measurements. The fourth wire scanner is positioned after a 45° bending magnet for energy spread measurements.

37465 **Time dependent chromaticity changes in the Tevatron.** Finley, D.A.; Edwards, D.A.; Hanft, R.W.; Johnson, R.; McInturff, A.D.; Strait, J. (Fermilab, Batavia, IL (US)). pp 151-153 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The Tevatron Collider energy is held constant at 150 GeV for some time while proton and antiproton bunches are injected prior to acceleration and storage. Under these conditions the machine chromaticity has been observed to change by as much as 70 units over the course of several hours. The data are consistent with a decay of the sextupole component of the 774 superconducting dipoles in the ring. Measurements of individual magnets in the Magnet Test Facility show similar behavior. An operating procedure has been devised to compensate for the chromaticity changes which gives a satisfactory beam lifetime.

37466 **Wave growth technique for collective wave accelerators.** Anselmo, A.P.; Nation, J.A. (Lab. of Plasma Studies and School of Electrical Engineering, Cornell Univ., Ithaca, NY (US)). pp 157-159 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The use of parametric scattering as a means of space charge wave growth for a converging guide, ion accelerator system is discussed. A 400-600 keV, 1.5-30 kA electron beam is passed through a self biasing, electrostatic wiggler in order to grow both slow and fast space charge waves. The authors present measurements of the wave frequency and associated wave fields as a function of the equilibrium. Furthermore, a calculation of the wave kinetic power flow and wave electromagnetic power flow is used to estimate the achievable axial electric field.

37467 **Transverse focussing using plasma wake fields.** Cline, D.B.; Cole, B.; Rosenzweig, J.; Norem, J. (Univ. of Wisconsin, Madison, WI (US)). pp 154-156 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Dense particle beams travelling in plasmas can produce very high electric and magnetic fields, and these fields can be used to accelerate and focus particles. The effects on trailing beams and self focusing can be strong and nonlinear. This paper discusses two aspects of self pinching beams: 1) the production of beams which do not self pinch, and 2) a short focal length plasma lens which uses self pinching to reduce beam sizes at the interaction point of a linear collider. As an example, the authors consider a final focus system for the Stanford Linear Collider, considering plasma production, vacuum system and backgrounds, and show how the luminosity could be increased using this system. The authors also discuss experimental tests of the plasma lens concept.

37468 **The Ultralac: A collective wave accelerator for ultrarelativistic particles.** Nation, J.A.; Anselmo, A.P. (Lab. of Plasma Studies and School of Electrical Engineering, Cornell Univ., Ithaca, NY (US)). pp 145-147 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Collective wave accelerator schemes utilizing slow waves on an electron beam have an upper energy limit on the load particles set by the drive beam velocity. Typical intense electron beams operating near limiting current have drift velocities between 0.7c and 0.9c, setting an energy limit for protons of about 1 GeV. In order to collectively accelerate electrons or ions aboue this limit, the drive wave must have a phase velocity greater than electron beam velocity. The Ultralac concept utilizes the fast upper hybrid wave for particle acceleration. It has a phase velocity that is bounded only in the lower limit by the electron drift velocity. Calculations are presented showing the operating parameters of such a device including beam and wave parameters and achievable field gradients, load particle current limits and particle focusing.

37469 **Some experiences from the commissioning program of the SLC arcs.** Fischer, G.E.; Brown, K.L.; Bulos, F.; Fieguth, T.; Hutton, A.; Murray, J.J.; Toge, N.; Weng, W.T.; Wiedemann, H. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 139-141 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The SLC Arc System is designed to transport beams of electrons and positrons from the end of the SLAC Linac to the beginning of the Final Focus System where they are made to collide head on. To minimize phase space dilution caused by quantum processes in the synchrotron radiation energy loss mechanism, the bending radii are large (279 m) and very high gradient (n = 32824) AG cells are arranged in trains of low dispersion, terrain following achromats. First experiences in operating a system of over 900 magnets, each with beam position monitors and corrector magnet movers, spanning 9000 feet, are described.

37470 **A very large β interaction region for the SSC.** Groom, D.E.; Garren, A.A.; Johnson, D.E. (SSC Central Design Group, Lawrence Berkeley Lab. 90-4040, Berkeley, CA (US)). pp 97-99 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Measurements of the p-p elastic scattering cross section into the Coulomb scattering region are important for determining the total p-p cross section, measuring the slope of the elastic cross section with momentum transfer, and normalizing the luminosity of the machine. At SSC energies, Coulomb scattering dominates only below 1 μrad. For the nominal SSC emittance (ϵ/sub N/ = 10/sup -6/m-rad), the angular spread of the beam is 6.8 x $\sqrt{1}$ m/β^* μrad. For the contribution of this spread to be comparable to the desired experimental resolution, the authors require $\beta^* \simeq 4000$ m. Moreover, to scan the cross section at larger angles it is desirable to tune β^* to smaller values. These requirements result in stringent IR design criteria: Crossing angles must be large to avoid disruption at bunch encounters, but not too large, in order to avoid synchro-betatron oscillations. At the same time, beams must pass through common triplet quadrupoles to be sufficiently separated for separate quadrupoles.

37471 **A low voltage repeater for studies of e-beam wave interactions.** Ivers, J.D.; Zhang, Y.Z.; Anselmo, A.; Nation, J.A. (Lab. of Plasma Studies and School of Electrical Engineering, Cornell Univ., Ithaca, NY (US)). pp 91-93 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

A long pulse (350 nsec.), low energy 40-80 kV), electron beam repeater has been built for the study of various electron beam wave interactions. The authors' primary interest is in the fast upper hybrid mode, which they wish to excite such that its phase velocity is equal to the speed of light and hence, is suitable for electron acceleration. The repeater is capable of a 1 Hz pulse rate at current levels of 1.4 kA, well above the space charge current limits of the experiments. Electron beam confinement is provided by a pulsed axial magnetic field of 300 to 1500 Gauss. A study of beam charac-

teristics using radial electric field probes, Faraday cups and Rogowski coils is underway. Results are presented showing the equilibrium beam plasma parameters as a function of the operating conditions. Techniques used for the wave growth are discussed and first results indicated. The wave frequency is chosen to be below the electromagnetic cutoff frequency of the empty guide. Results from the experiment will enable them to scale future experiments for 0.5 MeV, 2.0 kA beams supporting upper hybrid waves in the K-band. These high frequency waves on these more intense beams may lead to a high gradient (200 MV/m) electron accelerator.

37472 **Experimental beam dynamics in the SLC linac.** Seeman, J.T.; Campisi, I.E.; Hermannsfeldt, W.; Lee, M.; Petersen, A.; Tsang, D.; Abrams, G.S.; Adolphsen, C.; Soderstrom, E. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 73-76 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The component installation for the upgrade of the three-kilometer linac for the SLAC Linear Collider (SLC) was completed in late summer 1986. The system status and measurements of beam properties made during commissioning are described in this paper. Further linac measurements are reviewed in companion papers. In summary, a low-emittance electron beam from a damping ring has been accelerated through the linac and injected into the north SLC Arc with negligible loss. The maximum bunch intensity is 2.9 x 10/ sup 10/ electrons/pulse. A peak particle energy of 53 GeV has been reached. Operation at 47 GeV is now routine. The energy and energy spectrum of the electron beam can be rapidly measured nondestructively at high energy. These signals will be used in a fast feedback system nearing completion. The electron beam can be centered in the accelerator to about 200 μm rms. Slow feedback of the injection position and angle into the linac and injection into the north ARc are operational. Longitudinal and transverse wakefields have been measured and appear to be near expectations. Transverse position measurements at the end of the linac show a 120 μm horizontal and a 30 μm vertical (rms) jitter from pulse to pulse. The spot shape, including the transverse tails, also shows some jitter. The transverse position and shape fluctuations have several sources involving launch instabilities, chromatic effects, RF deflections and lattice mismatches. Continued improvements are expected. These parameter jitters would not preclude collisions. The measured invariant transverse emittances of the beam at 47 GeV are 2 x 10/sup -5/ rm vertically and 12 25 x 10/sup -5/ rm horizontally at 1 x 10/ sup 10/ e/sup -/. The horizontal emittance increases with beam intensity. Damped positrons have been injected into the linac, and trajectory correction is underway.

37473 **Studies of anomalous dispersion in the SLC second order achromat.** Fieguth, T.; Kheifets, S.; Murray, J.J. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 77-79 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Certain causes of anomalous dispersion in the second order achromats of the SLC arcs are investigated. For matched dispersion, transverse displacements of combined function magnets do not introduce anomalous dispersion. This is shown by deriving a non-dispersive condition connecting the average of the matched dispersion function with the quadrupole and sextupole components of the field. In the SLC Arcs, however, the achromats are rolled producing a dispersion mismatch. In this case, the horizontal (vertical) dispersion is affected linearly by vertical (horizontal) displacement of magnets. The integral condition connecting the dipole and quadrupole fields and the matched dispersion is also derived. Combining this with the non-dispersive condition and the analytic expression of the matched dispersion gives two simple relationships for the fields of second order achromats constructed of combined function magnets. The effects of the dispersion mismatch in the SLC Arcs is investigated using computer simulations. The results show that this mismatch will increase the sensitivity to transverse errors. The authors report the effects of certain systematic errors.

37474 **Computer simulation studies of electron beam propagation and collective ion acceleration in vacuum.** Chang, C.R.; Reiser, M. (Lab. for Plasma and Fusion Energy Studies, Univ. of Maryland, College Park, MD (US)). pp 106-108 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The propagation of a relativistic electron beam through plasma into vacuum via collective ion acceleration from the plasma is investigated with a numerical simulation code. Results show dynamic details of virtual cathode formation and the high-energy tail in the ion distribution not noticed previously.

37475 **Stability of the driving bunch in the plasma wakefield accelerator.** Su, J.J.; Dawson, J.M.; Katsouleas, T.; Wilks, S.; Chen, P.; Jones, M.; Keinigs, R. (UCLA, Los Angeles, CA (US)). pp 127-129 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The authors investigate the stability of the driving electron or positron beam in the plasma wakefield accelerator. Although the beam is subject to self-focusing, filamentation and two stream instability, they find that all of these can be annihilated by introducing thermal energy and an axial magnetic field.

37476 **Observations of the beam-beam interaction.** Seeman, J.T. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 121-153 of Nonlinear dynamics aspects of particle accelerators. Araki, H.; Ehlers, J.; Hepp, K.; Kippenhahn, R.; Weidenmuller, A.; Zittartz, J. New York, NY; Springer-Verlag New York Inc. (1986). (CONF-850114—).

From Joint US/CERN School on Particle Accelerators topical course on non-linear dynamics; Sardinia, Italy (31 Jan 1985).

During the past two and one-half decades a new colliding beam storage ring has been built and commissioned every two years on the average. This rate will continue at least for the next decade. With each new machine there is great excitement for new physics discoveries and there are many challenges for the accelerator builders. One of the challenges is the continual drive to increase the peak and integrated luminosities of these rings. The beam-beam interaction influences directly the luminosity and has been studied extensively. It has resisted complete understanding, both theoretically and experimentally. The primary difficulties are the nonlinearity of the Coulomb force and the bunch shapes (Gaussian), the large number of degrees of freedom (six), and the large numbers of particles involved ($\sim 10^{11}$). The observed complexity of the beam-beam interaction of this paper. The varied observations obtained from many storage rings happen to be sufficiently similar that a prescription can be formulated to describe the behavior of the luminosity as a function of beam current including the peak value. This prescription can be used to interpret various methods for improving the luminosity. Discussion of these improvement methods is accompanied with examples from actual practice. The consequences of reducing the vertical betatron function (one of the most used techniques) to near the value of the bunch length are reviewed. Finally, areas needing further experimental and calculational studies are pointed out as they are uncovered.

37477 Nonlinear beam-beam resonances. Chao, A.W.; Bambade, P.; Weng, W.T. (SSC Central Design Group, Univ. Research Association, c/o Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). pp 77-103 of Nonlinear dynamics aspects of particle accelerators. Araki, H.; Ehlers, J.; Hepp, K.; Kippenhahn, R.; Weidenmuller, A.; Zittartz, J. New York, NY; Springer-Verlag New York Inc. (1986). (CONF-850114—). Contract AC03-76SF00515.

From Joint US/CERN School on Particle Accelerators topical course on non-linear dynamics; Sardinia, Italy (31 Jan 1985).

In a colliding beam storage ring, a major source of nonlinear resonance excitation resides in the beam-beam collisions as the stored beams repeatedly cross each other. During such collisions, particles in each beam see the electromagnetic field generated by the counter rotating beam. The beam-beam collisions therefore perturb the particle motion, causing: 1. the transverse beam size to blow up and los of luminosity; 2. the beam lifetime to be reduced; 3. and rapid beam loss as beam intensity increases beyond a more or less distinct threshold. Considerable efforts, both experimental and theoretical, have brought some insight into the beam-beam instability problem and often led to improvements in luminosity. But the nature of the instability and its associated underlying mechanism(s) are not yet fully understood and remain an outstanding problem for the designers of colliding beam storage rings. To reduce the scope of this lecture, the authors consider only head-on collisions of bunched beams. For the sign convention of the beam-beam force, they assume the two colliding beams to have opposite charges. They also assume that the reader is at least somewhat familiar with Hamiltonian dynamics and some basic facts about the beam-beam interaction. For part of the discussions on coherent beam-beam effects, they assume the reader has some knowledge about the Vlasov equation.

37478 Single particle dynamics and nonlinear resonances in circular accelerators. Ruth, R.D. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 37-63 of Nonlinear dynamics aspects of particle accelerators. Araki, H.; Ehlers, J.; Hepp, K.; Kippenhahn, R.; Weidenmuller, A.; Zittartz, J. New York, NY; Springer-Verlag New York Inc. (1986). (CONF-850114—). Contract AC03-76SF00515.

From Joint US/CERN School on Particle Accelerators topical course on non-linear dynamics; Sardinia, Italy (31 Jan 1985).

The purpose of this paper is to introduce the reader to single particle dynamics in circular accelerators with an emphasis on nonlinear resonances. The authors begin with the Hamiltonian and the equations of motion in the neighborhood of the design orbit. In the linear theory this yields linear betatron oscillations about a closed orbit. It is useful then to introduce the action-angle variables of the linear problem. Next the authors discuss the nonlinear terms which are present in an actual accelerator, and in particular, they motivate the inclusion of sextupoles to cure chromatic effects. To study the effects of the nonlinear terms, they next discuss canonical perturbation theory which leads them to nonlinear resonances. After showing a few examples of perturbation theory, they abandon it when very close to a resonance. This leads to the study of an isolated resonance in one degree of freedom with a 'time'-dependent Hamiltonian. They see the familiar resonance structure in phase space which is simply closed islands when the nonlinear amplitude dependence or the frequency or 'tune' is included. To show the limits of the validity of the isolated resonance approximation, they discuss two criteria for the onset of chaotic motion. Finally, the authors study an isolated coupling resonance in two degrees of freedom with a 'time'-dependent Hamiltonian and calculate the two invariants in this case. This leads to a surface of section which is a 2-torus in 4-dimensional phase space. However, they show that it remains a 2-torus when projected into particular 3-dimensional subspaces and thus can be viewed in perspective.

37479 (AECL—8960) Conceptual design study for the proposed ISOL post-accelerator at TRIUMF. McMichael, G.E.; Chidley, B.G.; Hutcheon, R.M. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Nov 1985. 67p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702213/JAW.

The proposed TRIUMF ISOL facility will include the capability to accelerate the extracted radioactive heavy ions for use in a wide range of astrophysics experiments. This report presents a conceptual design for such a post-accelerator, with parameters specific to the TRIUMF facility. It features a 4-rod 23 MHz RFQ linac, able to accelerate singly charged ions with masses to 60 amu, from 1 to 60 keVamu, and a 23 MHz DTL for singly charged mass 20 ions (or triply charged ions of mass 60 or less) to complete the acceleration to any desired value in the range 0.265 to 1 MeVamu. Two single gap bucket rotator cavities reduce the energy spread to 1 part in 10^3 over the whole energy range.

37480 (ANL-HEP-CP—88-22) Calculation of higher order modes in the RHIC 27 MHz rf cavity. Schoessow, P. (Argonne National Lab., IL (USA)). May 1988. Contract W-31-109-ENG-38. 6p. (CONF-880335—3-Vugraphs). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012007/JAW.

From Workshop on the relativistic heavy ion collider performance; Upton, NY, USA (21 Mar 1988).

The URMEL code was used to calculate the frequencies, quality factors, and shunt impedances of the lowest modes of the proposed RHIC accelerating cavity. These values can be used as input for the calculation of the longitudinal and transverse coupled-bunch instabilities. The cavity dimensions were taken from the RHIC conceptual design report.

37481 (BNL—41016) A high intensity, low energy, monoenergetic positron beam at the Brookhaven National Laboratory. Weber, M.; Berko, S.; Canter, K.F.; Lynn, K.G.; Mills, A.P. Jr.; Moodenbaugh, A.R.; Roellig, L.O. (City Coll., New York (USA); Brandeis Univ., Waltham, MA (USA); Brookhaven National Lab., Upton, NY (USA); AT and T Bell Labs., Murray Hill, NJ (USA)). 1985. Contract AC02-76CH00016. 7p. (CONF-850118—3). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88007545/JAW.

From 3. international modal analysis conference; Orlando, FL, USA (28 Jan 1985).

This paper describes how a high intensity, low energy, monoenergetic positron beam can be produced from a ^{58}Cu source. 5 refs., 4 figs.

37482 (BNL—41158) The superconducting wiggler beamport at the National Synchrotron Light Source. Thomlinson, W.; Chapman, D.; Gmuer, N.; Lazarz, N. (Brookhaven National Lab., Upton, NY (USA)). 1987. Contract AC02-76CH00016. 19p. (CONF-870610—21). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009160/JAW.

From 5. national synchrotron radiation instrumentation conference; Madison, WI, USA (21 Jun 1987).

A beamport is currently being instrumented to utilize high energy synchrotron radiation from the superconducting wiggler magnet on the x-ray at the National Synchrotron Light Source. Two independent programs are being developed to run in tandem, non-concurrently, on the central beamline: material sciences on X17B1 and medical research/angiography on X17B2. A high pressure research program will run independently on a side station, X17C. Considerations in the design of the beamline include handling severe power loading, radiation shielding protection and beam energy filtering.

37483 **(BNL—41171) Manually-operated ultra-high-vacuum water-cooled slit mechanism for the U13U wiggler/undulator spectroscopy branch line at the National Synchrotron Light Source.** Hulber, S.L.; Rotela, E.; Shleifer, M. (Brookhaven National Lab., Upton, NY (USA); Department of Energy, Washington, DC (USA). Office of Basic Energy Sciences). Apr 1988. Contract AC02-76CH00016. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012133/JAW.

The authors describe a manually-operated ultra-high-vacuum (UHV) water-cooled slit mechanism. The design, which is based on the use of rigid parallelograms, provides a continuously adjustable bilateral slit opening. The entire mechanism is mounted on an eight-inch Conflat flange with two bellows for cooling water tubes and a linear feedthrough to control the size of the slit opening.

37484 **(BNL—41284) Radio frequency systems for present and future accelerators.** Raka, E.C. (Brookhaven National Lab., Upton, NY (USA)). 1987. Contract AC02-76CH00016. 23p. (CONF-8705288—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010666/JAW.

From 3. workshop on new techniques for future acceleration: RF and microwave systems; Erice, Italy (23 May 1987).

Rf systems are described for the FNAL Main Ring and Tevatron Ring, CERN SPS and LEP, and HERA proton acceleration system, CERN PS e^+ e/sup minus/ acceleration system, and CERN EPA monochromatic cavity. Low impedance rf systems in CERN ISR, the Brookhaven CBA, and SSC are also discussed.

37485 **(BNL—41371) Roles of scattered radiation in SRIXE.** Hanson, A.L. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 8p. (CONF-8804154—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012140/JAW.

From 23. school on physics; Zakopane, Poland (16 Apr 1988).

The scattering of x-rays is the major source of background and hence is a limiting factor in the minimum detectable limits available with SRIXE measurements. The scattering can be utilized for normalizing the net peak areas to fluctuations in sample thickness or mass on a relative basis or on a comparative basis. Even then measurement of the scattered x-rays should be made at backward angles. Measurement at forward angles should be avoided because of diffraction problems. The uncertainties in the measurement of an absolute intensity of the x-rays can be extremely large.

37486 **(CONF-880364—28) Charge exchange stripping cell measurements over a wide pressure range.** Colchin, R.J.; Roquemore, A.L.; Scott, S.D. (Oak Ridge National Lab., TN (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.). 1988. Contract AC05-84OR21400. 14p. (CONF-880364—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011016/JAW.

From 7. topical conference on high temperature plasma diagnostics; Napa, CA, USA (13 Mar 1988).

The efficiency of the stripping cell incorporated in a charge exchange analyzer has been measured over a pressure range of 1.8 to 130 mtorr and over an energy range of 1 to 130 keV/amu. In these measurements, a beam of hydrogen atoms was ionized by helium gas. As a by-product of the measurements, the scattering cross section was also measured. At the lowest pressure, the scattering cross section compared well with those measured previously; at high pressure, the cross section no longer followed an energy power law. The analyzer efficiency (defined as the fraction of the atoms that is ionized and not lost through scattering) can be modeled over the entire range of energy and pressure by including the measured scattering cross sections.

37487 **(CONF-8708180—13) Experimental observation of diffraction patterns from micro-specimens.** Sayre, D.; Yun, W.B.; Kirz, J. (International Business Machines Corp., Yorktown Heights, NY (USA). Thomas J. Watson Research Center; Argonne National Lab., IL (USA); State Univ. of New York, Stony Brook (USA). Dept. of Physics). Mar 1988. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012049/JAW.

From Symposium on X-ray microscopy; Upton, NY, USA (31 Aug 1987).

Small non-periodic specimens scatter soft x-rays strongly enough to permit scattered-photon imaging. For the type of imaging principally studied here (diffraction-pattern imaging), the requirements on divergence and monochromaticity of the illumination are also moderately well understood, and appear to be capable of being sufficiently well met by undulator beamlines to permit imaging to the diffraction-limited resolution of $\lambda/2$, provided of course that a method of phasing the diffraction pattern is available. It may be remarked that for holography the illumination requirements, while varying with the form of holography, are more severe than for diffraction-pattern imaging, while for imaging microscopy they may be considerably less severe, depending on the angular and frequency bandwidths of the imaging element. It would appear to be for this reason that imaging microscopes are currently achieving exposure times of a few seconds even on bending-magnet beamlines.

37488 **(DOE/ER/40039—19) Gas delivery system and beamline studies for the test beam facility of the Collider Detector at Fermilab.** Franke, H.G. III. (Texas A and M Univ., College Station (USA). Dept. of Physics). Dec 1987. Contract AS05-81ER40039. 121p. NTIS, PC A06;3. Order Number DE88011178/JAW.

A fixed-target test beam facility has been designed and constructed at the Meson Test (MT) site to support studies of components of the Collider Detector at Fermi National Accelerator Laboratory (CDF). I assisted in the design and constuction of the test beam facility gas delivery system, and I conducted the initial studies to document the ability of the MT beamline to meet the needs of CDF. Analysis of the preliminary performance data on MT beamline components and beam tunes at required particle energies is presented. Preliminary studies show that the MT beamline has the necessary flexibility to satisfy most CDF requirements now.

37489 **(DOE/ER/40150—44) Application of radio frequency superconductivity to recirculating linacs.** Sundelin, R.M. (Continuous Electron Beam Accelerator Facility, Newport News, VA (USA)). 1988. Contract AC05-84ER40150. 17p. (CEBAF-PR—88-002). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008599/JAW.

Although an recirculating linear accelerator (RLA) was built and successfully operated many years ago, recent developments in rf superconductivity, which developments have raised practical gradients from 2 MV/m to 5 MV/m, have made RLA's with energies >1 GeV economically feasible. RLA's using present superconducting rf technology are slightly less expensive and have substantially higher quality beams than stretcher rings fed by pulsed linacs. This paper discusses these developments and new design considerations. 25 refs., 7 figs.

37490 **(DOE/ER/45231—3) [Construction and operation of SUNY facilities at the National Synchrotron Light Source]: Progress report, December 1, 1987-November 30, 1988.** Coppens, P. (State Univ. of New York, Buffalo (USA)). 1988. Contract FG02-86ER45231. 30p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010538/JAW.

The SUNY PRT was formed in 1980 to give SUNY researchers and their associates access to advanced facilities in Materials Research at the National Synchrotron Light Source. The beamline which we have constructed during the past years allows a large variety of novel experiments, and will achieve its full potential when NSLS resumes operation. It is open to all PRT members, which include non-SUNY faculty, and in addition provides access to general users during 25% of beamtime. The PRT has designed and constructed a multi-disciplinary facility, initially located at port X21, and more recently moved to X3. The first branch, X21A, became operational in January 1985 at the start-up of the x-ray ring. By the end of the Phase 1 experimental period, four ports were being used or in advanced states of commissioning. Modifications and additions are being made during the move to X3 which will result in five experimental stations, of which three will have independent optics, and two timeshare a mirror/monochromator combination. A description of the present status of the stations and a summary of recent results are given. Since no beamtime was

available during the past 14 months, these mainly reflect analysis of data collected in the preceding year. A full list of PRT publications since the inception of the project is included. The large number of papers presented at conferences during the 1986-1989 period attest to the productivity of our facility.

37491 **(FNAL-TM—1519) Rf cavity primer for cyclic proton accelerators.** Griffin, J.E. (Fermi National Accelerator Lab., Batavia, IL (USA)). Apr 1988. Contract AC02-76CH03000. 37p. (CONF-8705291—). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010655/JAW.

From 4. INFN ELOISATRON project workshop: very high energy proton-proton physics; Erice, Italy (31 May 1987).

The purpose of this note is to describe the electrical and mechanical properites of particle accelerator rf cavities in a manner which will be useful to physics and engineering graduates entering the accelerator field. The discussion will be limited to proton (or antiproton) synchrotron accelerators or storage rings operating roughly in the range of 20 to 200 MHz. The very high gradient, fixed frequency UHF or microwave devices appropriate for electron machines and the somewhat lower frequency and broader bandwidth devices required for heavy ion accelerators are discussed extensively in other papers in this series. While it is common pratice to employ field calculation programs such as SUPERFISH, URMEL, or MAFIA as design aids in the development of rf cavities, we attempt here to elucidate various of the design parameters commonly dealt with in proton machines through the use of simple standing wave coaxial resonator expressions. In so doing, we treat only standing wave structures. Although low-impedance, moderately broad pass-band travelling wave accelerating systems are used in the CERN SPS, such systems are more commonly found in linacs, and they have not been used widely in large cyclic accelerators. Two appendices providing useful supporting material regarding relativistic particle dynamics and synchrotron motion in cyclic accelerators are added to supplement the text.

37492 (GSI—87-11, pp D12.1-D12.2) **Beam port and irradiation chamber of the RIKEN ring cyclotron for biological samples.** Kaneko, I.; Eguchi-Kasai, K.; Takahashi, T.; Kosaka, T.; Nakano, K. (Institute of Physical and Chemical Research, Wako, Saitama (Japan)). Jul 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753546/JAW. (CONF-870779—).

From 3. workshop on heavy charged particles in biology and medicine; Darmstadt, F.R. Germany (13 Jul 1987).

37493 (GSI—87-11, pp K6.1-K6.6) **Heavy ion synchrotron SIS.** Blasche, K. Jul 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753546/JAW. (CONF-870779—).

From 3. workshop on heavy charged particles in biology and medicine; Darmstadt, F.R. Germany (13 Jul 1987).

37494 (GSI—87-11, pp K7.1-K7.7) **Projectile-fragment separator at SIS.** Geissel, H.; Armbruster, P.; Franczak, B.; Klepper, O.; Langenbeck, B.; Nickel, F.; Poppensieker, K.; Roeckl, E.; Schardt, D.; Schmidt, K.H. Jul 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753546/JAW. (CONF-870779—).

From 3. workshop on heavy charged particles in biology and medicine; Darmstadt, F.R. Germany (13 Jul 1987).

37495 **(GSI—87-84-Prepr.) RF system of a synchrotron for protons and heavy ions.** Boehne, D. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Dec 1987. 15p. (CONF-8705288—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753378/JAW.

From 3. workshop on new techniques for future acceleration: RF and microwave systems; Erice, Italy (23 May 1987).

In this paper the potential and the constraints of producing many kilovolts of rf accelerating voltage for synchrotrons in a cumbersome board frequency range are reviewed from the electrical engineering standpoint. This paper elaborates on numbers and limits which determine cost and complexity of the rf system. (orig./HSI).

37496 **(INFN/TC—86-14) Construction and assembling of the trim coils for the Milan superconducting cyclotron.** Baccaglioni, G.; Cartegni, G.C.; Fusetti, M.; Gini, L.; Grilli, L. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1986. 17p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702276/JAW.

This paper presents the main characteristics of the trim coils realized for the heavy ions superconducting cyclotron under construction at the Milan University. The guidelines in the choice of the conductor size, of the insulation and cooling parameters are discussed in some details. The main operations in the coils construction, as winding, impregnation, electrical tests and assembling, are described.

37497 **(INFN/TC—87-11) Optimization of the shape of the HV electrode of the electrostatic deflectors for the Milan superconducting cyclotron.** De Martinis, C.; Ferrari, A. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1987. 63p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702277/JAW.

The electrostatic deflectors for the extraction of the beam from the Milan Superconducting Cyclotron are presently under development. The early tests showed that major troubles arise from the modifications induced in the discharge mechanism by the presence of the magnetic field, resulting in a drastic reduction of the deflector performances. Therefore a detailed analysis of the electric field configuration of the deflector has been carried out in order to improve its performances. In this paper the results so far obtained in the optimization of the shape of the electrode and insulator fixing are reported.

37498 **(INIS-SU—28) Non-mirror wave reflection by strip grating on the metal-dielectric substrates.** Kusajkin, A.P. (AN Ukrainskoj SSR, Kharkov. Inst. Radiofiziki i Ehlektroniki). 1986. 36p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702389/JAW.

On the basis of the strong solution of the diffraction problem numerical investigation of energetic and phase characteristics of iron-mirror reflection of a plane wave from infinite periodic strip grating placed on the metallodielectric sublayer has been carried out. The results obtained are of interest for development of the systems of attenuation of interferences, creation of high quality open resonators, waveguide filters, diplexers and others SHF devices. Preprint-313; 10 refs.; 18 figs.

37499 **(JINR—9-87-322) Measurement of JINR modified phasotron extracted proton beam parameters.** Abazov, V.M.; Gustov, S.A.; Zorin, V.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702122/JAW.

The energy, energy distributions, vertical and horizontal emittances of extracted proton beam of modified JINR phasotron are measured. It is shown that the measured beam parameters permit to solve satisfactorily the problem of beam transport to the target of the π-meson wide angle lens. 8 refs.; 3 figs.; 1 tab.

37500 **(KEK—87-8) Proceedings of the 6th meeting on ultra high vacuum techniques for accelerators and storage rings.** Horikoshi, Gen-ichi (ed.). (National Lab. for High Energy Physics, Oho, Ibaraki (Japan)). Aug 1987. vp. (In Japanese). (CONF-8702140—). NTIS (US Sales Only), PC A10/MF A01. Order Number DE88780082/JAW.

From 6. meeting on ultra high vacuum techniques for accelerators and storage rings; Oho, Japan (27 Feb 1987).

Separate abstracts were prepared for individual papers in these proceedings. (LEW)

37501 **(LA-UR—88-1617) A CW-pion focusing horn for low-energy muon neutrino beams.** Dombeck, T.; Koetke, D.D.; Koetke, D.S.; Fisk, R. (Los Alamos National Lab., NM (USA); Valparaiso Univ., IN (USA)). 1988. Contract W-7405-ENG-36. 14p. (CONF-880695—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010923/JAW.

From 1. European particle accelerator conference; Rome, Italy (7 Jun 1988).

Low-energy muon neutrino beams can be produced from pion decays in-flight at high-intensity accelerators, such as the Los Alamos Meson Physics Facility (LAMPF), providing a new tool to study the role of the weak interaction in nuclear and particle physics. Employing a pion focusing device can enhance the neutrino flux by large factors, and reduce backgrounds by sign-selection of the parent pions. However, LAMPF's long beam pulse and high repetition rate makes it impractical to use pulsed horns like those found at high-energy accelerators. In this paper we discuss a CW-pion focusing device that uses coils wound inside vanes mounted radially around the beam axis to provide an azimuthal field. From our studies with a prototype magnet, we have found the optimum field configuration needed to focus pions at LAMPF energies can be obtained by adjusting the radial density of turns in the coils. This optimum yields an eight-fold increase in neutrino flux above the muon threshold over the bare-target case. Our calculations also indicate a correlation between the arrival time of the neutrinos in the detector and their energy.

37502 **(LA-UR—88-1687) Linac working group technical summary.** Schriber, S.O. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 9p. (CONF-880263—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010934/JAW.

From Accelerator design workshop; Los Alamos, NM, USA (22 Feb 1988).

The working group looked at linac injectors for a Superconducting Super Collider (SSC) or Hadron Facility. Discussion includes rf power, a possible strawman linac, ion source/injector, radio-frequency quadrupole, and coupled-cavity linac. (LEW)

37503 **(LBL—24686) Development of high current and high brightness negative hydrogen ion sources.** Leung, K.N. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 21p. (CONF-880614—1; CONF-880614—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010882/JAW.

From 7. international conference on ion implantation technology; Kyoto, Japan (7 Jun 1988).

Negative hydrogen ions have found important applications in particle accelerators and in fusion research. These ions can be generated from two different types of ion sources—the surface conversion source and the volume production source. Recent experiments demonstrate that H/sup {minus/} current exceeding 1 A can be obtained from both types of ion sources. Because of the lower H/sup {minus/} ion temperature and the fact that they can be operated without cesium, volume H/sup {minus/} sources are highly desired. However, further technology must be developed on the control of electrons and the reduction of gas flow before this type of sources become practical units of a multiampere neutral beam injection system.

37504 **(LBL—24734) Advances in metal ion sources.** Brown, I.G. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 15p. (CONF-880614—4). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012020/JAW.

From 7. international conference on ion implantation technology; Kyoto, Japan (7 Jun 1988).

Beams of metallic ion species can be produced by the ECR (electron cyclotron resonance) ion source and by the MEVVA (metal vapor vacuum arc) ion source. Although the ECR source is fundamentally a gaseous ion source, metal ion beams can be produced by introducing metallic feed material into the plasma discharge using a number of techniques. The ion charge states can be very high, which is a significant advantage to most applications. The MEVVA ion source, on the other hand, is specifically a metal ion source. It has produced metallic ion beams from virtually all the solid metallic elements at a current of typically hundreds of milliamperes; the ions produced are in general multiply ionized, but not as highly stripped as those generated in the ECR source. Although the MEVVA source at present operates in a pulsed mode with a low duty cycle (≦ 1%), work is in progress to increase the duty cycle significantly. In this paper the operation and performance of the LBL ECR and MEVVA ion sources, with respect to metal ion generation, are described.

37506 **(LBL—25255) Insertion device vacuum system designs.** Hoyer, E. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 12p. (CONF-880552—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012025/JAW.

From Vacuum design of advanced and compact synchrotron light sources; Upton, NY, USA (16 May 1988).

Synchrotron light source insertion device vacuum systems now in operation and systems proposed for the future are reviewed. An overview of insertion devices is given and four generic vacuum chamber designs, transition section design and pumping considerations are discussed. Examples of vacuum chamber systems are presented.

37506 **(SAND—88-1032) RADLAC-II upgrade injector experiments.** Hasti, D.E.; Shope, S.L.; Frost, C.A.; Leifeste, G.T.; Mazarakis, M.G.; Poukey, J.W.; Smith, D.L. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 29p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011282/JAW.

The RADLAC-II upgrade is correcting pulsed power and beam injection and transport problems to increase the output beam energy and current and to improve beam quality. Initial experiments with a modified pulsed power module and injector are described and results, which agree with predictions, are presented. The pulsed power module generated >2.5 MVstage with >40 ns pulse width and >20 ns flattop. The output from the RADLAC-II injector, using two of these stages, was a 5 MeV, 40 kA, 1 cm radius annular beam with β/sub {perpendicular/} = 0.19. Particle code simulations show that the beam which the injector experiments produced will result in a 20 MeV, 40 kA, 1 cm radius beam with total β/sub {perpendicular/} < 0.2, when the upgrade is completed. This beam will allow high current conditioning, lead pulse stability, and current scaling experiments to be completed.

37507 **(SLAC-PUB—4622) Algorithms for the self-consistent simulation of high power klystrons.** Eppley, K. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). May 1988. Contract AC03-76SF00515. 6p. (CONF-880178—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010684/JAW.

From Workshop on accelerator and beam optics codes; San Diego, CA, USA (19 Jan 1988).

We discuss an improvement to the algorithm developed by Yu for modelling rf cavities in klystrons using the port approximation. In this method, the cavity is simulated by imposing an rf voltage as a boundary condition across the outer wall. The voltage and phase are chosen to be consistent with the cavity impedence and with the rf current induced by the electron beam. In the original method, each cavity was calculated successively using either linear theory or an iterative method to achieve a self-consistent voltage. The new method relaxes the voltage and phase of several cavities simultaneously during the simulation. The time dependence of the voltages are calculated from a relaxation equation. The new algorithm reduces the total computation time by about a factor of five for a complete klystron.

37508 **(UCRL—21052) Preliminary design for a pierce wiggler beamstick and addendum.** Pirkle, D. (Lawrence Livermore National Lab., CA (USA)). May 1988. Contract W-7405-ENG-48. 30p. NTIS, PC A03;3. Order Number DE88011310/JAW.

Lawrence Livermore National Laboratory is developing a fast tunable microwave source for operation at 250 GHz and 10kW peak output power. This report presents the preliminary design of a Pierce gun and solenoid magnet that will be compatible with a Pierce-wiggler electron beam formation system (beamstick). The beamstick will be an appropriate power source for a tunable gyro-BWO at 250 GHz. Figure 1 presents the major components of the Pierce-wiggler beamstick: the electron gun, solenoid, beam tunnel, wiggler, and vacuum valve. Figure 2 shows an artistic conception of how the beamstick will interface with the interaction magnet, modulator and gyro-BWO circuit at MIT. 15 figs.

37509 **Progress report on the SLD Cerenkov ring imaging detector system.** Hallewell, G.; Ashford, V.; Bienz, T.; Bird, F.; Gaillard, M.; Kwon, Y.J.; Leith, D.; McShurley, D.; Nuttall, A.; Oxoby, G. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* 35: No. 1, 398-403(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

The authors report on the development of the Cerenkov Ring Imaging Detector for the SLD experiment at the SLAC Linear Collider. In particular the authors outline recent progress in engineering and new construction techniques which will greatly simplify the manufacture of the 40 quartz window drift tubes required for the barrel CRID. Progress in the preliminary design of the endcap CRID is reviewed, and the development of operating, monitoring and control systems for the complete detector is discussed.

37510 **The CEBAF control system architecture.** Bork, R. (Continuous Electron Beam Accelerator Facility, 12070 Jefferson Avenue, Newport News, VA 23606 (US)). pp 523-525 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The focus of this paper is on CEBAF's computer control system. This control system utilizes computers in a distributed, networked configuration. The architecture, networking and operating system of the computers and preliminary performance data are presented. The authors also discuss the design of the operator consoles and the interfacing between the computers and CEBAF's instrumentation and operating equipment.

37511 **Tuned beam position detector for the Fermilab switchyard.** Kerns, Q.; Childress, S.; Crawford, C.; Fuja, R.; Janes, R. pp 661-663 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Stripline beam position detectors, similar to those in the Fermilab Energy Doubler, have been designed to operate in the Fermilab Switchyard, with instantaneous extracted beam intensities smaller by a factor of 10^7 than present in the accelerator. The detectors are tuned to resonance at the RF frequency of 53.1 MHz., with a resulting increase of detector shunt impedance from 50 Ω to 9.5 KΩ and a Q of around 190. Beam position determination of 0.1 mm has been achieved for beam intensities as small as 10^3 protons per RF bucket.

37512 **Beam trajectory acquisition system for the arcs of the Stanford Linear Collider.** Pellegrin, J.L.; Ross, M.C.; Scott, B.D.; Wilson, D.S. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 673-675 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—). Contract AC03-76SF00515.

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The Beam Position Monitoring system of the Collider Arcs constitute the main tool, along with the Moving Magnet system and the Backleg Windings, for controlling the beam emittance growth. The two Arcs are analogous to two strongly focused transport lines. The focusing and defocusing magnets can be rocked an amount of +- 1 mm at their upstream end as part of the orbit correction scheme. This motion is in one plane only and, as a result, the BPM, which is mounted on the moving end of each magnet, is wired in such a way as to detect horizontal or vertical beam displacements only, depending on whether this BPM is attached to a focusing or a defocusing magnet. This Beam Position Monitoring system is different from other BPM systems at SLAC, not only by the expense of its hardware (908) monitors, 500,000 feet of coaxial cable, over 20,000 connectors) but also by its ungated, self-triggered electronics. Moreover, it is the first time that the authors attempt to operate their BPMs with all the processing electronics installed in the accelerator tunnel.

37513 **The Los Alamos Free-Electron Laser energy-recovery experiment.** Feldman, D.W.; Warren, R.W.; Watson, J.M.; Stein, W.E.; Fraser, J.S.; Spalek, G.; Lumpkin, A.H.; Carlsten, B.E.; Takeda, H.; Wang, T.F. (Los Alamos National Lab., Los Alamos, NM (US)). pp 221-223 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The authors concluded experiments demonstrating energy recovery in conjunction with the Los Alamos free-electron laser. In this paper, the authors discuss measurements of electron-beam transport during decelerations greater than 70% from 21 MeV down to 5 MeV. Power-flow measurements demonstrate the efficient conversion of beam power back into rf power and it reuse in the accelerator. They also describe instabilities of the system and compare them with simulations.

37514 **State of the art in polarized proton sources.** Alessi, J.G. (Brookhaven National Lab., Upton, NY (US)). pp 249-253 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Present day polarized H/sup +/ and H/sup -/ ion sources are reviewed by describing the performance of sources representative of each of the techniques being used. New ideas for producing higher intensities are then mentioned. Presently, pulsed H/sup +/ currents in the milliampere range, and H/sup -/ currents of hundreds of μA's, can be obtained.

37515 **Commissioning of the SLC injector.** Sheppard, J.C.; Bambade, P.S.; Clendenin, J.E.; Gearhart, R.A.; Miller, R.H.; Sodja, J. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 43-46 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

For every cycle of the SLC, the injector is required to launch two electron bunches and a single positron bunch into their respective emittance damping rings. Each bunch is to have a population of 7.5x10/sup 10/ particles/bunch, an energy of 1.21 GeV, and a full width energy spread of less than 2%. The electron beams are produced from a thermionic cathode, bunched, and accelerated to about 200 MeV. Positrons are injected after electrons at the 200 MeV point. The three bunches, spaced by approximately 60 ns, are subsequently accelerated to the damping ring energy within a single RF pulse. As of September 1986, all of the injector hardware had been installed and tested. Single electron bunches were being produced, stabilized with respect to energy characteristics, and injected into the damping rings. Commissioning of two electron bunch operation is currently in progress. Three bunch running should be commissioned by early 1987 and the SLC injector is expected to be operational by April 1987. This paper reports on the hardware and software developments necessary for the injector. The operational status of the entire system is discussed.

37516 **Motion control system for the Fermilab electrostatic septa.** Lackey, S.; Coburn, M.; Crawford, C.; Elseth, J.; Knopf, W. (Fermi National Accelerator Lab. (US)). pp 617-618 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

For many years the intensities of the proton beams going to the various experimental areas of the Fermi National Accelerator Laboratory were controlled by moving the beam relative to the wires of the electrostatic septa splitting stations. A change in this basic philosophy was made previous to the last fixed target run at Fermilab. The authors now have a system that moves the septa relative to the stationary beam. Magnets are no longer adjusted while changing split ratios. This has resulted in less tuning of the beam lines downstream of splitting stations. As many as ten, ten foot long electrostatic septa have been moved simultaneously while maintaining alignment to within a mil.

37517 **New low-level RF system for the Fermilab booster synchrotron.** Kerns, C.; Crisp, J.; Kerns, Q.; Miller, H. (Fermi National Accelerator Lab., P.O. Box 500, Batavia, IL (US)). pp 619-621 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

This paper describes the Booster low-level RF system that was constructed to meet these recently added requirements: (1) synthesizer controlled capture frequency at injection, (2) very low-phase noise over the machine cycle, (3) smooth phase-lock of beam to an external reference frequency and (4) ability to accelerate either a full turn or partial turn of beam.

37518 **Resonance control for a CW accelerator.** Young, L.M.; Biddle, R.S. (Los Alamos National Lab., Los Alamos, NM (US)). pp 634-636 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

This paper describes a resonance-control technique that has been successfully applied to several cw accelerating structures built by the Los Alamos National Laboratory for the National Bureau of Standards and for the University of Illinois. The technique involves sensing the rf fields in an accelerating structure as well as the rf power feeding into the cavity and, then, using the measurement to control the resonant frequency of the structure by altering the temperature of the structure. The temperature of the structure is altered by adjusting the temperature of the circulating cooling water. The technique has been applied to continuous wave (cw) side-coupled cavities only but should have applications with most high-average-power accelerator structures. Some additional effort would be required for pulsed systems.

37519 **Progress in the design of a DC FEL power source using a pelletron driver.** Larson, D.J.; Cline, D.B.; Anderson, D.R.; Rosenzweig, J.B.; Mills, F.E.; Sundquist, M.L.; Adney, J.R.; Dehais, S.J. (Univ. of Wisconsin, 1150 University Ave., Madison, WI (US)). pp 215-217 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The authors discuss progress in the design of a DC Free Electron Laser power source using a Pelletron electrostatic accelerator as a driver. Such a power source should deliver up to 200 kW DC power in wavelengths ranging from a few microns to a few centimeters. The advantages of this system for use as a power source for future acceleration techniques are its efficiency, tunability and high average power. In order to achieve DC operation of the system extremely high electron recovery efficiencies are required. It is also likely that FEL operation will result in a large spread of electron energies. These design constraints require the development of a highly efficient electron beam collector as well as beam optic capable of recirculating beams with a large energy spread. The authors present collector and beamline designs and include electron optics studies for the full range of operating conditions.

37520 **On-line electron beam measurements for the Los Alamos Free-Electron Laser.** Lumpkin, A.H.; Feldman, R.B.; Feldman, D.W.; Stein, W.E. (Los Alamos National Lab., P.O. Box 1663, Los Alamos, NM (US)). pp 212-214 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Recent developments in the electron beam diagnostics used on the Los Alamos Free-Electron Laser (FEL) have extended the authors' on-line, quantitative analysis capability to extraction efficiency and micropulse temporal duration. The FEL's 20-MeV electron beam is 10 μs in length and consists of —2000 micropulses of 20-ps duration and 46-ns separation. This extreme range of time scales is addressed by employing a combination of synchronized beam deflectors, an electron spectrometer, intensified video cameras, real-time video digitizers, and microcomputers. The tapered wiggler result for extraction efficiency (2%)and results for pulse duration measurements (10-15 ps) by two techniques are presented.

37521 **A single-pass free-electron laser for soft x-rays with wavelengths $\leqq$ 10 nm.** Goldstein, J.C.; Wang, T.F.; Newnam, B.E.; McVey, B.D. (Los Alamos National Lab., Los Alamos, NM (US)). pp 202-204 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The authors consider a single-pass FEL amplifier, driven by an rf-linac followed by a damping ring for reduced emittance, for use in generating intense coherent light at wavelengths $<$ 10 nm. The dependence of the optical gain on electron beam quality, studied with the 3-D FEL simulation code FELEX, is given and related to the expected power of self-amplified spontaneous emission. Design issues for the damping ring to achieve the required electron beam quality are discussed.

37522 **Plasma wave wigglers for free electron lasers.** Joshi, C.; Katsouleas, T.; Dawson, J.M.; Yan, Y.T.; Chen, F.F. (Univ. of California, Los Angeles, CA (US)). pp 199-201 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The authors explore the possibility of using relativistic plasma density waves as wigglers for producing free electron laser radiation. Two possible wave and beam geometries are explored. In the first, the wiggler is a purely electric wiggler with frequency ω/sub p/ (plasma frequency) but (approximately) zero wavenumber κ/sub p/. If an electron beam is injected parallel to a wide plasma wave wavefront, it is wiggled transversely with an apparent wiggler wavelength λ/sub w/ = $2\pi c/\omega$/sub p/. In the second scheme, the electron beam is injected down the axis between two narrow plasma waves propagating opposite to the beam. The electrons are wiggled by the radial fields of the waves and are guided (focused) by the waves' ponderomotive force. With either scheme, effective wiggler wavelengths of order 50-100 μ may be obtained in a plasma of density 10/sup 17/(cm/sup -3/), thereby permitting generation of short wavelength radiation with modest energy beams. The effective wiggler strengths a/sub w/ = eA/mc/sup 2/ $\approx$ 0.5 can extremely large. The authors discuss the excitation methods for such wigglers and examine these with PIC computer simulations.

37523 **Induction linac-based FELs.** Briggs, R.J.; Birx, D.L.; Prono, D.S.; Prosnitz, D.; Reginato, L.L. (Lawrence Livermore National Lab., Livermore, CA (US)). pp 178-182 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The multikiloampere peak currents available from linear induction accelerators make high-gain, free-electron-laser-amplifier configurations feasible. High-extraction efficiencies in a single pass of the electron beam are possible if the wiggler parameters are appropriately "tapered," as recently demonstrated at millimeter wavelengths on the 4-MeV ELF facility. Magnetic pulse power systems enable high-repetition-rate operation of the accelerator for high-average-power applications. Key issues involved in extending the technology to shorter wavelengths and higher average power are described.

37524 **Superconducting quadrupoles for the SLC final focus.** Erickson, R.; Fieguth, T.; Murray, J.J. (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA (US)). pp 142-144 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The final focus system of the SLC will be upgraded by replacing the final quadrupoles with higher gradient supperconducting magnets positioned closer to the interaction point. The parameters of the new system have been chosen to be compatible with the experimental detectors with a minimum of changes to other final focus components. These parameter choices are discussed along with the expected improvement in SLC performance.

37525 **Collective ion acceleration via laser controlled ionization channel.** Destler, W.W.; O'Shea, P.G.; Rodgers, J.; Segalov, Z. (Lab. for Plasma and Fusion Energy Studies, Univ. of Maryland, College Park, MD (US)). pp 103-105 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Initial results from a successful laser-controlled collective ion acceleration experiment at the University of Maryland are presented. In the experiment, positive ions are trapped in the potential well at the head of an intense relativistic electron beam injected at current levels above the space charge limit. Seed ions for acceleration are provided by puff valve injection of a neutral gas cloud localized to within 3 cm of the injection point. Control over the acceleration of the well and the ions is then achieved by means of a laser-generated ionization channel produced by passing the light from a Q-switched ruby laser through a series of partially and fully reflecting mirrors in such a way as to provide time-sequenced laser ionization of a target located on the drift tube wall. Using this system, controlled acceleration of protons at a rate of approximately 40 MV/m has been demonstrated over a distance of about 50 cm.

37526 **Fabrication and 35GH/sub z/ testing of key two-beam accelerator components.** Hopkins, D.B.; Koehler, G.W.; Kuenning, R.W.; Low, W.; Sessler, A.M.; Prosnitz, D.; Throop, A.L.; Westenskow, G.R.; Haimson, J. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). pp 80-82 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

This paper discusses two 34-cavity 10-cm long, 33.3 GH/sub z/ high gradient accelerator sections fabricated by different methods. Also described are the construction and testing of a septum coupler designed for periodically extracting power from the free electron laser (FEL) portion of a two-beam accelerator.

37527 **A design for a 2 km experimental straight section for the SSC.** Johnson, D.E.; Toohig, T.E. (SSC Central Design Group, c/o Lawrence Berkeley Lab., Berkeley, CA (US)). pp 89-90 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

The design of an experimental insertion for the SSC suitable for a very forward spectrometer is presented. This design has a usable space of +-1000 m around the interaction point and can achieve a luminosity of approximately 10/sup 30/ cm/sup -2/ s/sup -1/. The design utilizes large-aperture quadrupoles which are part of the spectrometer array to focus the two beams. In order to achieve the necessary free space for this design, a beam bypass of one of the clustered straight sections is utilized. This bypass allows for the possibility of two, approximately 2.5 km sections free of horizontal dipole magnets. The bypass stubs needed to permit this possibility to be implemented in the future would increase the overall circumference of the SSC by roughly 3%.

4304 Storage Rings

37528 **(CONF-880552—3) Design for ANL 7 GeV storage ring vacuum system.** Wehrle, R.B.; Nielsen, R.W. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 12p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012064/JAW.

From Vacuum design of advanced and compact synchrotron light sources; Upton, NY, USA (16 May 1988).

The 7-GeV Advanced Photon Source (APS) design includes a storage ring having a 1060-m circumference with the capability of accommodating 34 insertion devices (ID) and their associated photon beam lines. An additional 35 photon lines can be provided from bending magnets. The vacuum system for the storage ring is designed to maintain a beam-on operating pressure of 1n Torr or less to achieve a positron beam lifetime of approximately 20 hours. The vacuum system and it's current developmental status are described.

37529 **(DESY-HERA—87-15) Modified harmonic closed orbit adjustment formalism for the optimization of polarization in electron storage rings.** Barber, D.P.; Ripken, G. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). May 1987. 32p. Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.).

We extend the closed orbit correction formalism of an earlier paper (1985) to take into account the notion that the polarization in electron storage rings may be more sensitive to tilts, δn vector, of the equilibrium spin axis in some parts of the lattice than in others. This is achieved by means of a periodic weighting function. The formalism requires some modifications of the computer program already developed for implementing the ideas given in the cited paper. (orig./HSI).

37530 **(GAO/RCED—87-175FS) Federal research projects: Concerns about DOE's super collider site selection process.** (General Accounting Office, Washington, DC (USA)). 1987. 23p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

In April 1987, the Department of Energy issued an invitation for site proposals for its proposed $4.375 billion Superconducting Super Collider soliciting states and others to provide land to the U.S. government on or under which to build and operate the SSC. This report examines whether precedents exist for selecting sites for multimillion dollar research projects on the basis of competitive bidding, with states providing land and other incentives.

37531 (INIS-mf—11223, pp 589-605) **Physics at the ep-collider HERA.** Mattig, P. (Deutsches Elektronen-Synchrotron (DESY), Hamburg (Germany, F.R.)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The basic features of the electron-proton storage ring HERA are presented and some possibilities of e-p measurements related to standard physics which offer HERA are discussed. The signatures and mass range of new states to be probed at HERA are also discussed. 20 refs., 15 figs. (M.F.W.).

37532 **(LA-UR—1682) Analysis ob beam losses at PSR [Proton Storage Ring].** Macek, R.J.; Fitzgerald, D.H.; Hutson, R.L.; Plum, M.A.; Thiessen, H.A. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 4p. (CONF-880695—2; CONF-880695—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010921/JAW.

From 1. European particle accelerator conference; Rome, Italy (7 Jun 1988).

Beam losses and the resulting component activation at the Los Alamos Proton Storage Ring (PSR) have limited operating currents to about 30μA average at a repetition rate of 15 Hz. Loss rates were found to be approximately proportional to the circulating current and can be understood by a detailed accounting of emittance growth in the two step injection process along with Coulomb scattering of the stored beam during multiple traversals of the injection foil. Calculations and simulations of the losses are in reasonable agreement with measurements.

37533 **Relativistic heavy ion collider project: A status report.** Ludlam, T.W.; Samios, N.P. (Brookhaven National Lab., Upton, NY (USA)). *Zeitschrift fuer Physik [Sektion] C: Particles and Fields;* **38**: No. 1/2, 353-359(Apr 1988). (CONF-8708166—).

From 6. international conference on ultra-relativistic nucleus-nucleus collisions; Nordkirchen, F.R. Germany (24 Aug 1987).

The relativistic heavy ion collider (RHIC) is a proposed facility at Brookhaven National Laboratory for very high energy collisions of nuclear beams. The project has had a substantial amount of R and D effort and is ready to begin construction within the next year or two, as funding permits. We describe the parameters of the machine, discuss the current status of development work on the project, and describe the requirements for experiments at such a facility.

37534 **Operating results for the beam profile monitor system currently in use at Bevalac facility.** Stover, G.; Fowler, K. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). pp 622-624 of Proceedings of the 1987 IEEE particle accelerator conference: Accelerator engineering and technology. Lindstrom, E.R.; Taylor, L.S. Piscataway, NJ; IEEE Service Center (1987). (CONF-870302—).

From Particle accelerator conference; Washington, DC, USA (16 Mar 1987).

Three stations of a soon to be completed multi-station, multi-wire beam monitoring system have been installed in the Bevalac transfer line. The following article provides a cursory analysis of the electronic circuitry, discuss new design additions and summarizes the operating results obtained the last year.

37535 **Nonlinear dynamics aspects of modern storage rings.** Helleman, R.H.G.; Kheifets, S.A. (La Jolla Institute, CNLS, P.O. Box 1434, La Jolla, CA 92038 (US)). pp 64-76 of Nonlinear dynamics aspects of particle accelerators. Araki, H.; Ehlers, J.; Hepp, K.; Kippenhahn, R.; Weidenmuller, A.; Zittartz, J. New York, NY; Springer-Verlag New York Inc. (1986). (CONF-850114—).

From Joint US/CERN School on Particle Accelerators topical course on non-linear dynamics; Sardinia, Italy (31 Jan 1985).

The authors try to address the following two questions: a. Why should accelerator physicists to be interested in the recent, sometimes abstract, developments in Nonlinear Dynamics, a field which will recently was mainly studied by mathematicians, theoretical physicists and astronomers? That such an interest to some extent already exists is apparent from the fact that many accelerator physicists attended this School and several analogous meetings in the past. b. Why should researchers from nonlinear dynamics be interested in modern Storage Rings which are largely designed and built by experimental physicists and engineers? At the moment few 'nonlinear scientists' work on storage rings (or in the field of accelerator physics). It is a hopeful sign that many (more) attended this School.

37536 **Theories of statistical equilibrium in electron-positron colliding-beam storage rings.** Schonfeld, J.F. (Fermi National Accelerator Lab., P.O. Box 500, Batavia, IL (US)). pp 315-342 of Nonlinear dynamics aspects of particle accelerators. Araki, H.; Ehlers, J.; Hepp, K.; Kippenhahn, R.; Weidenmuller, A.; Zittartz, J. New York, NY; Springer-Verlag New York Inc. (1986). (CONF-850114—).

From Joint US/CERN School on Particle Accelerators topical course on non-linear dynamics; Sardinia, Italy (31 Jan 1985).

In this lecture the author introduces some recent theoretical work that represents a significant and long overdue departure from the mainstream of ideas on the physics of colliding-beam storage rings. The goal of this work in question is to understand analytically - without recourse to computer simulation - the role that dissipation and noise play in the observed colliding-beam behavior of electron-positron storage rings. More traditional approaches have given such "thermal" processes relatively little attention, with results that have been qualitative at best.

37537 **(BNL-tr—1066) Metal-coated ceramic chambers for PETRA.** Hemmie, G. (Brookhaven National Lab., Upton, NY (USA)). [1988]. Contract AC02-76CH00016. Translation of report DESY--S1-77/05, May 1977. 33p. NTIS, PC A03;3.

The PETRA vacuum chamber should have as good a conductance as possible. The spectra of fields to which the chamber is to be transparent is relatively narrow, and beam instabilities are not expected until shunt impedence reach above 100Mhz, so metal coated ceramic chambers are to be used. Topics discussed include beam spectrum and beam measurements, losses in the chamber wall caused by the beam, shielding effect of a cylindrical metal coating, and measurement of homogeneity and losses. (LEW)

44 INSTRUMENTATION

37538 **(INPE—4124) 4-channel time delayed pulse generator.** Wetzel, L.F.S.; Rossi, J.O.; Del Bosco, E. (Instituto de Pesquisas Espaciais, Sao Jose dos Campos (Brazil)). Feb 1987. 31p. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702394/JAW.

It is described the project of a 4-channel delayed pulse generator employed to trigger the plasma centrifuge experiment of the Laboratorio Associado de Plasmas. The circuit delivers pulses with amplitude of 15V, full width at half maximum of 50μs and rise time of 0.7μs. The maximum time delay is 100ms. There are two channels with a fine adjustment of 0-1ms. The system can be manually or automatically driven.

4401 Radiation Instrumentation

(Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Bundesanstalt fuer Geowissenschaften und Rohstoffe, Hannover (Germany, F.R.)). 1987. 70p. (In German). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen,, Germany, F.R.

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

The problem was to apply a radiometric measuring system (with a detector crystal with a volume of 16.8 litres) which is part of the equipment of a BGR helicopter used for geophysical prospecting, for certain purposes of radiation protection. An extension of the existing EDP, the computer-controlled representation of results and of theoretical investigations was associated with this. Due to a larger flying program, documents on the natural radiation intensity in the Harz area and cover certain industrial, mining and waste disposal areas were produced. It is shown how the counting rates measured with the gamma ray spectrometer at altitude can be converted to equivalent dose rate of the radiation at ground level (for radiation sources distributed over large areas) by various corrections and conversions. The conditions in which a radioactive point source on the radiating earth's surface is traced by measurements in flight, are examined. A 256 channel analyser was used.

37540 **(BNL—41071) Aging effects in wire chambers operated at low pressure with TMAE and its effect on the use of BaF_2-TMAE calorimetry at the SSC [Superconducting Super Collider].** Woody, C.L. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 8p. (CONF-880356—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008773/JAW.

From Task force meeting on radiation effects at the superconducting super collider; Berkeley, CA, USA (7 Mar 1988).

This note summarizes the result of a study carried out on the aging effects in low pressure wire multiwire proportional chambers operated with gas mixtures containing TMAE. The purpose of the study was to investigate the effects of radiation damage in low pressure wire chambers used as a part of a BaF_2-TMAE calorimeter operated at high rates for an extended period of time. 8 refs., 6 figs.

37541 **(BNL—41078) Effects of radiation damage to TMP [tetramethylpentane], TMS [tetramethylsilane] and liquid argon solutions.** Holroyd, R. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 14p. (CONF-880356—2). NTIS, PC A03. Order Number DE88008239/JAW.

From Task force meeting on radiation effects at the superconducting super collider; Berkeley, CA, USA (7 Mar 1988).

The effects of exposure of calorimeter liquids like tetramethylsilane (TMS), 2,2,4,4-tetramethylpentane (TMP) and liquid argon solutions to the large doses of ionizing radiation expected in the SCC environment is examined. Like other organic liquids TMS and TMP are decomposed by radiation to various products; thus, we must consider the effects these products may have on the calorimeter operation. Questions considered include how will radiation effect electron drift velocity and lifetime? Will gaseous products produce significant pressure buildup? Are dose rate effects significant? Do we expect different effects from neutrons compared to minimum ionizing radiation? 16 refs., 5 figs., 3 tabs.

37542 **(CENBG—8715) Monte-Carlo simulation of multicounter system characteristics used for the double beta decay study of ^{76}Ge.** Larrieu, P. (Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires). Oct 1987. 140p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753940/JAW.

The response function of a detection system including 19 NaI detectors in coincidence with 4 germanium detectors is a complex function of several parameters like nature and position of gamma rays emitting source, detector sizes, nature of constituent materials, system geometry. The most important characteristics of an experimental setup applied to the study of double beta decay in ^{76}Ge have been simulated using Monte Carlo calculations and compared to experimental results.

37543 **(CIEMAT—606) High speed UNIBUS-VME interface.** Olmos, P. (Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas, Madrid (Spain)). Jun 1987. 50p. (In Spanish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702839/JAW.

An interface between VME and the UNIBUS of PDP or VAX computer is presented. The system supports high speed parallel communication (up to 1MB/S) and is composed of two modules. One of these is a commercial DR11M board which performs DMA transfers between UNIBUS and the external word. The other is a VME module specifically developed for this application. The interface has been tested under VMS operating system in VAX and VALET-PLUS system for the VME Bus. We describe in detail the VME module and its connection with the DR11M. Software, both in WMS and VALET, is also described. (author) 10 figs., 7 refs.

37544 **(CONF-880546—13) Responses of C_6D_6 and C_6F_6 gamma-ray detectors and the capture in the 1.15-keV resonance of ^{56}Fe.** Perey, F.G.; Johnson, J.O.; Gabriel, T.A.; Macklin, R.L.; Winters, R.R.; Todd, J.H.; Hill, N.W. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 13p. (CONF-880546—). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011008/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

We have used the electron gamma-ray transport code EGS to calculate responses of C_6D_6 and C_6F_6 gamma-ray detectors, where the geometry of the capture experiments was carefully modelled. Very good agreement was obtained with spectra from selected resonances in the capture of neutrons by ^{207}Pb. Weighting functions based upon the calculated responses were used in measuring the capture in the 1.15-keV resonance of ^{56}Fe relative to the capture in the Au 4.9-eV resonance. The neutron width was measured to be 64.5+-3. MeV with C_6F_6 detectors, and 63.0+-2.5 meV with C_6D_6 detectors. These valuues are in good agreement with the value of 61.7+-0.9 MeV found from transmission measurements. 16 refs., 6 figs.

37545 **(DOE/ER—13065-528) Performance of the AMY central drift chamber in a high magnetic field.** Ueno, Koji. (Rochester Univ., NY (USA). Dept. of Physics and Astronomy). [1988]. Contract AC02-76ER13065. 20p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008097/JAW.

This note describes the design characteristics of the AMY central drift changer (CDC) and its performance during its operation for the first year since it was installed in the AMY solenoid on October 24, 1986. In general, the chamber has performed according to our original specifications, providing us with good efficiency and excellent spatial resolution. 5 figs.

37546 **(DOE/ER/40039—20) Testing and calibrating a hadron calorimeter.** Cao, Hung Duc. (Texas A and M Univ., College Station (USA). Dept. of Physics). 1988. Contract AS05-81ER40039. 41p. NTIS, PC A03;3. Order Number DE88011177/JAW.

We propose to test and calibrate the Forward/Backward Hadron Calorimeter of the CDF (Collider Detector at Fermilab). It is designed to cover a pseudorapidity region of 2.2 ≤ {vert bar} {eta} {vert bar} ≤ 4.2. It is composed of multiproportional wire-chambers and steel plates. The test data were taken form the CDF Test Beam facility during Dec. 1987 and Jan. 1988. We describe the characteristics of our calorimeter and the result of our analysis. 8 refs., 17 figs.

37547 **(DOE/ER/40125—16) Indiana University high energy physics group, Task E. Technical progress report, December 1, 1987-June 1, 1988.** Alyea, E.D. Jr. (Indiana Univ., Bloomington (USA). Dept. of Physics). 1988. Contract AC02-84ER40125. 26p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012122/JAW.

Task E of the Indiana University High Energy Physics Group was established on December 1, 1987. This progress report covers the period December 1, 1987 to June 1, 1988. Work was concentrated on the development of the Large Volume Detector (LVD) at the Gran Sasso Laboratory in Italy. Most effort was devoted to design and experimental tests for the gas recirculating and purification system of the limited streamer tubes used in particle tracking. Some time was also devoted to the valuation of competing designs for the data acquisition system of the limited streamer tubes.

37548 **(DOE/ER/40325—2-A) Silicon drift-chamber prototype for the upgrade of the UA6 experiment at the CERN p {bar char}p collider.** Gatti, E.; Longoni, A.; Sampietro, M.; Giacomelli, P.; Vacchi, A.; Rehak, P.; Kemmer, J.; Holl, P.; Struder, L.; Kubischta, W. (Politecnico di Milano (Italy). Dipt. di Elettronica; Rockefeller Univ., New York (USA); Brookhaven National Lab., Upton, NY (USA); Technische Univ. Muencheń, Garching (Germany, F.R.). Fakultaet fuer Physik; Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.); European Organization for Nuclear Research, Geneva (Switzerland)). 1987. Contract AC02-87ER40325. 10p. (CONF-8709153—4; RU—87/E-3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008099/JAW.

From Conference on position-sensitive detectors; London, UK (7 Sep 1987).

A large-area (≃ 4 x 4 cm^2) silicon drift chamber has been designed and constructed in order to investigate its possible use in the UA6 experiment. The drift chamber will supply unambiguously (x,y) space points on each track; each arm of the UA6 spectrometer will be provided with two layers of drift detectors. 12 refs., 4 figs.

37549 (GSI—87-11, pp A2.1-A2.4) **Profiles of latent tracks.** Albrecht, D. (Hartmann und Braun A.G. Mess- und Regeltechnik, Frankfurt am Main (Germany, F.R.)). Jul 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753546/JAW. (CONF-870779—).

From 3. workshop on heavy charged particles in biology and medicine; Darmstadt, F.R. Germany (13 Jul 1987).

37550 **(IKDA—87/12) Fast decay components in the scintillation gases Ar, Ar-N_2, Xe, and He-Xe excited by heavy-ion impact.** Grimm, P.; Hambsch, F.J.; Mutterer, M.; Theobald, J.P.; Kubota, S. (Technische Hochschule Darmstadt (Germany, F.R.). Inst. fuer Kernphysik; Rikkyo Univ., Tokyo (Japan). Dept. of Physics). May 1987. 17p. Also published in Nucl. Instrum. Methods Phys. Res., Sect. A (15 Dec 1987) Vol. 2162(2/3) p. 394-402.

The delayed single-photon method was applied to measure the decay-time structure of gas scintillations in the noble gases Ar and Xe, Ar with an admixture of N_2, and He with an admixture of Xe, after excitation by heavy ions. Measured decay times are fitted to relevant models that describe the population and decay of noble gas excimers as well as energy transfer processes. Deduced decay parameters are compared with values known from scintillations excited by lower-ionizing radiation. With 13 figs..

37551 **(INFN/AE—87-5) Charge collection in partially depleted Silicon detectors.** Fontanelli, F.; Ramella, P.; Vitale, S. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1987. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702274/JAW.

The behaviour of partially depleted silicon detectors deserves some attention in the design of large system as electromagnetic or hadronic calorimeters in which these detectors are used and conservative operating conditions must be imposed. Charge collection from the undepleted region in silicon detectors manufactured for high energy calorimetry by Ansaldo Semiconductors S.p.A. has been experimentally investigated. The observed results are compared with a simple model.

37552 **(INFN/TC—88-6) Pulse generator for the performance control of NAI detectors.** Castoldi, M.; Rottura, A. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1988. 4p. (In Italian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702281/JAW.

A simple pulse generator is described that reveals to be economic and easy to be operated. The doublet generator can be assembled as a multistage version, due to its modular nature. The long term stability is also reported.

37553 **(ISH—110) Measurement of chemiluminescence of solids as possible indicator system for rapid dose determination following radiation accidents.** Hammermaier, A.; Reich, E.; Boegl, W. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Jun 1987. 123p. (In German). Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

14 different types of pharmaceutical tablets, 18 different pharmaceutical powders, and 32 other solid substances (foodstuffs, environmental materials, etc.) were tested. The results from pharmaceutical powders have shown after optimizing the test conditions that, in some pharmaceuticals, radiation doses of less than 1 Gy were still detectable. Other pharmaceuticals either demonstrated only a slight increase in intensity or none at all. For pharmaceuticals in tablet form, the sample must be processed prior to measurement (deteriorating the detection limit). For examining the various solid substances, materials were selected which are non-soluble or only poorly soluble in luminol solution. All samples were exposed to a radiation dose of 100 Gy. When extrapolating on the basis of a linear dose-effect relation-ship into a lower dose range, it becomes clear that it will be very difficult, if it is possible at all, to find any poorly soluble materials in the liminol solution which could indicate an exposure in the area of 10 Gy or below.

37554 **(ITEF—106(1987)) Installation for purification of liquid rare gases with volume to 100l by means of the spark technique.** Anisimov, S.N.; Barabash, A.S.; Bolozdynya, A.I.; Stekhanov, V.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 12p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702887/JAW.

An installation for purification of liquid rare gases with volume up to 100 l by means of a titanium powder sputtered into liquids by spark discharge has been constructed. In this installation 5 and 25 liquid krypton have been purified up to the electron capture length L=24 and 3 cm, respectively, in electric field E=2 kVcm at the temperature 135 K. Moreover it has been shown that a gaseous krypton are purified with help of the "nickel on kizilgure" ($NiSiO_3$) absorber from electronegative impurities. In this way in 5 of liquid krypton the electron capture length 3 cm (E=2 kVcm) have been achieved. 9 refs.; 7 figs.

37555 **(JINR—E-10-87-378) Supercomputer for parallel data analysis.** Kolpakov, I.F.; Senner, A.E.; Smirnov, V.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 11p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702148/JAW.

The project of a powerful multiprocessor system is proposed. The main purpose of the project is to develop a low cost computer system with a processing rate of a few tens of millions of operations per second. The system solves many problems of data analysis from high-energy physics spectrometers. It includes about 70 MOTOROLA-68020 based powerful slave microprocessor boards liaisoned through the VME crates to a host VAX micro computer. Each single microprocessor board performs the same algorithm requiring large computing time. The host computer distributes data over the microprocessor board, collects and combines obtained results. The architecture of the system easily allows one to use it in the real time mode. 4 refs.; 6 figs.

37556 **(JINR—R-1-87-560) Software and hardware complex on the base of semiconductor detectors operating on-line with the MERA-60/45, ES-1060 and ES-1061 computers.** Butsev, V.S.; Butseva, G.L.; Nefed'eva, L.S.; Panyutchev, E.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 22p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702159/JAW.

Submitted to the journal Instrum. Exp. Tech. .

The improved software and hardware complex (setup GAMMA) are described in detail. Using these facilities, the fragmentation of projectiles, target-nuclei and production and decay mechanism of radioactive nuclides on beams of relativistic particles and nuclei (p, d, a, ^{12}C, ^{16}O) of an energy of 4.5 GeVnucleon ac-

celerated at the Dubna synchrophasotron have been studied during 1980-1987. The facilities consist of Ge(Li)-detectors CAMAC multichannel analyzers on-line with HP-2116B and MERA-6045 computers and appropriate software. The facilities are used for the acquisition of spectrometric information, its preliminary processing and transfer to the base BESM-6, ES-1060 and ES-1061 computers. A problem-oriented system of programs for precision spectrometric information processing used in the indicated experiments is described. 17 refs.; 5 figs.

37557 **(JINR—R-3-87-531) Resolution function of neutron diffractometer on IBR-2 pulsed reactor.** Balagurov, A.M.; Beskrovnyj, A.I.; Popa, N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1987. 13p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702449/JAW.

The resolution of the time-of-flight neutron diffractometer DN-2 on the IBR-2 is constructed on the base of experimental data. The comparison of calculated and measured diffraction spectra from the standard Al_2O_3 polycrystalline sample pointed to their conformity within the 2.5% limit. 4 refs.; 9 figs.; 1 tab.

37558 **(JINR-E—13-87-399) High-voltage test and training of plastic streamer tubes for the DELPHI hadron calorimeter.** Alekseev, G.D.; Cellar, S.; Khomenko, B.A.; Korytov, A.V.; Kulinich, P.A.; Micelmacher, G.V.; Sedykh, Yu.V.; Toledo, R. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702915/JAW.

Submitted to the journal DELPHI-Notes.

The results of high-voltage test and training of plastic streamer tubes of the DELPHI hadron calorimeter are presented. The testing technique is considered in detail. The equipment for high-voltage training consists of a mini-computer, CAMAC-electronics, a controllable high-voltage supply and a digital ampermeter. The experimental results shows that high-voltage training of streamer tubes improves their characteristics. The value of dark current decreased up to 1 μA. The operational voltage range increased by a value more than 300 V. 2 refs.; 8 figs.

37559 **(JINR-R—1-87-551) Electron and hadron separation by means of a system consisting of an active converters, scintillation counter and total absorption spectrometer.** Astvatsaturov, R.G.; Arkhipov, V.V.; Vasil'ev, S.E. and others. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702925/JAW.

Submitted to the journal Instrum. Exp. Tech. .

The possibility of hadron suppression with the aid of the system consisting of an "active" lead-glass converter, Cherenkov lead-glass γ-spectrometer and a scintillation counter of 1 m long was investigated on a beam of 2 GeVc π^--mesons that contains ~6% of electrons. The scintillation counter having two photomultipliers at two opposite ends operated in the dEdx mode. The application of the system of counters makes it possible to increase the hadron suppression by a factor of 14 as compared to the one by total absorption counters only. The detection efficiency of electron is > 90%. The accuracy of determination of the axis X-coordinate σ/sub x/ of an electromagnetic shower produced in converters (lead glass, lead plates) was also investigated by means of the scintillation counter by the time interval between the arrival of light signals. The accuracy of measuring the axis X-coordinate of the electromagnetic shower in the lead plates from 2 r.u. to 6 r.u. in thickness was practically constant (σ/sub x/=2.1 cm). 7 refs.; 6 figs.; 1 tab.

37560 **(JINR-R—10-87-254) Specialized processor with algebraic structure for event fast selection.** Nikityuk, N.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 19p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702937/JAW.

Submitted to the journal Instrum. Exp. Tech. .

A processor having algebraic structure for fast selection of events detected in a scintillation hodoscope is described. The main property of the processor is that data read out from the scintillation hodoscope and then (in parallel) analysed to determine the multiplicity of events and their coordinates are calculated. The rule for the construction of such a processor is the following. The number of inputs n is 15, signals t=1, t=2, t=3 and t ≧ 4 are formed from the first group of outputs, information on the coordinates of three simultaneously registered events is obtained from the second group of outputs. Moreover, with the help of random access memory module of 1Kbit capacity in which data are preliminary written, at a separate output of the processor under the condition that the signals from given combination of three scintillators are generated. The delay from the input to the output is not more than 35 ns. 17 refs.; 13 figs.; 1 tab.

37561 **(JINR-R—13-87-407) Time-of-flight small-angle scattering spectrometers on pulsed neutron sources.** Ostanevich, Yu.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1987. 14p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702944/JAW.

Submitted to the Organizing Comittee of the 10. International conference on small angle scattering and applied methods, Prague, 13-16 Jul 1987.

The operation principles, constructions, advantages and shortcomings of known time-of-flight small angle neutron scattering (TOF SANS) spectrometers built up with pulsed neutron sources are reviewed. The most important characteristics of TOF SANS apparatuses are rather a high luminosity and the possibility for the measurement in an extremely wide range of scattering vector at a single exposure. This is achieved by simultaneous employment of white beam, TOF technique for wave length-scan and the commonly known angle-scan. However, the electronic equipment, data-matching programs, and the measurement procedure, necessary for accurate normalization of experimental data and their transformation into absolute cross-section scale, they all become more complex, as compared with those for SANS apparatuses operating on steady-state neutron sources, where only angle-scan is used. 28 refs.; 4 figs.

37562 **(LA-UR—88-830) Progress report on the Los Alamos tritium beta decay experiment.** Wilkerson, J.F.; Bowles, T.J.; Knapp, D.A.; Robertson, R.G.H.; Wark, D.L. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 11p. (CONF-880369—2). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88007893/JAW.

From International symposium on neutrino mass and related topics; Tokyo, Japan (16 Mar 1988).

Measurements near the endpoint of the tritium beta-decay spectrum using a gaseous molecular tritium source yield an essentially model-independent upper limit of 27 eV on the {ovr ν}/sub e/ mass at the 95% confidence level. Since demonstrating from this initial measurement the successful operation of a gaseous source based system, most of our effort has been concentrated towards the upgrade and optimization of the experimental apparatus. The emphasis of this work has been to eliminate or further reduce effects that generate systematic errors. Based on realistic projections from our initial measurement, an ultimate sensitivity to neutrino mass of 10 eV is expected. 12 refs., 1 fig.

37563 **(LA-UR—88-1465) The USDOE mobile non-destructive assay and examination system.** Dowdy, E.J. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 13p. (CONF-8806151—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010958/JAW.

From U. S. DOE/DOD and CEA-France symposium; Tours, France (20 Jun 1988).

A mobile system for non-destructive assay (NDA) and non-destructive examination (NDE), developed at the Los Alamos National Laboratory, provides accurate and sensitive determination of quantities of transuranic (TRU) isotopes contained in 208-{ell} drums of wastes and furnishes images of the contents for further sorting purposes. The NDA unit consists of four major subsystems: an assay chamber, counting and digital electronics, data acquisition, and a neutron generator. It performs both active and passive neutron measurements for the determination of the amount of fissile isotopes at a sensitivity level of 1 mg plutonium, and the determina-

tion of the spontaneous fission and (α,n) isotopes at a comparable level. A complete assay consists of sequential active and passive measurements. The data analysis includes various matrix corrections and a determination that the drum does or does not exceed the 100-nCi/g threshold for TRU wastes. The NDE unit is used to examine for liquids and other materials that are prohibited for long term storage of the drums. An x-ray camera images the contents of 208-{ell} drums that are brought into the system on a conveyor and rotated in front of an x-ray source. Free liquids can be detected by shaking the drum and observing liquid motion on the video screen. Made to fit on flatbed trailers, the entire system can be transported to a Department of Energy (DOE) facility and be ready for operations within 5 hours after arrival. Field tests have been performed on three separate occasions, accomplishing more than 1800 waste drum examinations. 8 refs., 9 figs., 1 tab.

37564 **(LBL—24506) Nuclear breakup and particle densities in 200 A GeV - ^{16}O interactions with emulsion nuclei.** Adamovich, M.I.; Alexandrov, Y.A.; Asimov, S.A.; Badyal, S.K.; Basova, E.; Bhalla, K.B. (Academia Sinica, Beijing, BJ (China); Lawrence Berkeley Lab., CA (USA); CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France); Rajasthan Univ., Jaipur (India); Jammu Univ. (India); Lund Univ. (Sweden); Philipps-Univ., Marburg (Germany, F.R.); AN SSSR, Moscow. Fizicheskij Inst.; National Research Council of Canada, Ottawa, Ontario; Washington Univ., Seattle (USA); AN Uzbekskoj SSR, Tashkent. Inst. Yadernoj Fiziki; AN Uzbekskoj SSR, Tashkent. Fiziko-Tekhnicheskij Inst.). Sep 1987. Contract AC03-76SF00098. 11p. (CONF-8709152—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88005735/JAW.

From 18. international symposium on multiparticle dynamics; Tashkent, USSR (8 Sep 1987).

Experiment EMU-01 makes use of emulsion chambers and conventional stacks to study the interactions in matter of 200 A GeV ^{16}O nuclei accelerated at the CERN SPS. Projectile fragmentation is compatible with such interactions of ^{16}O nuclei at 2 A GeV, indications of limiting fragmentation. Particle production is examined via high precision pseudo-rapidity distributions. Energy densities up to about 3 GeVfm^3 are observed in central ^{16}O + Ag(Br) interactions. Pseudo-rapidity density distributions and fluctuations are well reproduced by the MC model Pritiof, although the existence of new and unknown sources of density fluctuations are not excluded by the data. 7 refs., 7 figs.

37565 **(LBL—25063) Detection of charged particles in thick hydrogenated amorphous silicon layers.** Fujieda, I.; Cho, G.; Kaplan, S.N.; Perez-Mendez, V.; Qureshi, S.; Ward, W.; Street, R.A. (Lawrence Livermore National Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 6p. (CONF-880408—18; CONF-880408—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009817/JAW.

From Spring meeting of the Materials Research Society; Reno, NV, USA (4 Apr 1988).

We show our results in detecting particles of various linear energy transfer, including minimum ionizing electrons from a Sr-90 source with 5 to 12 micron thick n-i-p and p-i-n diodes. We measured W (average energy to produce one electron-hole pair) using 17keV filtered xray pulses with a result W = 6.0 {+-} 0.2eV. This is consistent with the expected value for a semiconductor with band gap of 1.7 to 1.9eV. With heavily ionizing particles such as 6 MeV alphas and 1 to 2 MeV protons, there was some loss of signal due to recombination in the particle track. The minimum ionizing electrons showed no sign of recombination. Applications to pixel and strip detectors for physics experiments and medical imaging will be discussed. 7 refs., 8 figs.

37566 **(NUREG/CR—4728) Equipment qualification research test of a high-range radiation monitor.** Richards, E.H.; Jacobus, M.J.; Drozda, P.M.; Lewin, J.A. (Sandia National Labs., Albuquerque, NM (USA)). Feb 1988. Contract AC04-76DP00789. 61p. NTIS, PC A04/MF A01 - GPO;1. Order Number TI88011626/JAW.

A high-range radiation detector was tested in a simultaneous steam and radiation environment simulating a postulated loss-of-coolant accident (LOCA) to assess possible synergistic effects that may be important to its performance in an accident. The detector, manufactured by General Atomic, was simultaneously subjected to a simulated accident environment including 171{degree}C (340{degree}F) steam at 410 kPa gage (60 psig) and 4 Mrad/hr gamma radiation while its performance was monitored. Test results showed that the detector successfully operated at the high dose rate and temperature, without evidence of synergisms. However, at reduced radiation levels in a saturated steam environment, the detector signal at the readout module deteriorated in accuracy or ceased altogether. The cause of these anomalies is attributed to leakage currents and/or possible galvanic action in the coaxial connections and/or cables.

37567 **(ORNL—6461) Literature survey of aerosol and iodine-vapor deposition models relevant to TVA radiation monitor sampling line conditions.** Wright, A.L. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011369/JAW.

This report describes work performed as part of a project entitled "Investigation of the Degree of Iodine Holdup in Air Monitoring Sampling Lines." The work was sponsored by the Tennessee Valley Authority as project TVA-58784A. This report, the first in a series, summarizes the available modeling data base for predicting iodine aerosol and vapor deposition in air-monitoring sampling lines. Sample aerosol and vapor deposition calculations are presented for conditions that might simulate those present in a sampling line during severe accident conditions.

37568 **(OUP—87-42) Intelligent CPIB controller.** Wikne, J.C. (Oslo Univ. (Norway). Fysisk Inst.). Dec 1987. 74p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752498/JAW.

An intelligent GPIB (General Purpose Interface Bus) controller is described. It employs an autonomous slave CPU together with a dedicated controller/talker/listener chip to handle the GPIB bus protocol, thus freeing the host computer from this time-consuming task. Distribution of a large part of the necessary software to the slave side, assures that the system can be implemented on virtually any computer with a minimum of effort.

37569 **(PPPL—2515) Relative intensities of 2.5 and 14-MeV source neutrons from comparative responses of U-235 and U-238 detectors.** Jassby, D.L.; Hendel, H.W.; Bosch, H.S. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1988. Contract AC02-76CH03073. 17p. (CONF-880364—27). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011166/JAW.

From 7. topical conference on high temperature plasma diagnostics; Napa, CA, USA (13 Mar 1988).

The response of polyethylene-moderated U-235 fission counters is only weakly dependent on incident neutron energy, while the response of unmoderated U-238 or Th-232 fission counters increases strongly with energy. A given concentration of D-T neutrons in a mixed DT-DD source results in a unique relative detector response that depends on the parameters R14 and R2.5, where R14 is the ratio of the unmoderated U-238 and moderated U-235 detector efficiencies for a pure 14-MeV neutron source, and R2.5 is the corresponding ratio for a pure 2.5 MeV source. We have determined R14 and R2.5 using D-D and D-T neutron generators inside the TFTR vacuum vessel. The results indicate that, for our detector geometry, the ratio of U-238 to U-235 count rates should increase by a factor of about 3 when the fusion neutron source changes from pure D-D to pure D-T. This calibration is being applied to recent TFTR {open+-quotes}supersh ot{close+-quotes} data, where the uncollided neutron flux in the post-beam phase contains a high proportion of D-T neutrons from the burnup of D-D tritons. 8 refs., 4 figs,. 2 tabs.

37570 **(REG/G—8.12-Rev.2) Proposed revision 2 to Regulatory Guide 8.12: Criticality accident alarm systems: Draft Regulatory Guide.** (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research). May 1988. 6p. United States Nuclear Regulatory Commission, Washington, DC 20555. Order Number TI88010126/JAW.

Section 70.24, "Criticality Accident Requirements," of 10 CFR Part 70, "Domestic Licensing of Special Nuclear Material," requires licensees who are authorized to possess special nuclear material in excess of certain amounts to maintain a criticality accident alarm system. This guide describes a system acceptable to the NRC staff for meeting the Commission's requirements for a criticality accident alarm system.

37571 **(SIS—1987:10) Equipment, measurement technique and annealing of LiF (TLD-100) in TL-dosimetry.** Unhjem, J.F. (Statens Inst. for Straalehygiene, Oslo (Norway)). 1987. 31p. (In Norwegian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752499/JAW.

Results of variations in reference light, dark current, TL-signal and total background signal during a read-out series of LiF (TLD-100) crystals are presented. Also two annealing procedures are compared. The results indicate a good signal-to-noise ratio, E(S)/σ, and that a new annealing procedure takes less time to carry out. Because of the time-saving effect and the high signal-to-noise ratio, the new annealing procedure can be recommended.

37572 **(SLAC-PUB—4553) A silicon vertex detector for a B factory.** Lueth, V. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Mar 1988. Contract AC03-76SF00515. 9p. (CONF-871261—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009022/JAW.

From Workshop on B-meson factory; Courmayeur, Italy (14 Dec 1987).

The design of a Silicon vertex detector for a high luminosity e$^+$e/sup {minus/} linear collider is discussed, with emphasis on the choice of parameters for the layout, resolution and segmentation.

37573 **(UND-HEP—85-RR01) A cerium glass fiber-optic active target for high energy physics experiments.** Ruchti, R.; Baumbaugh, B.; Bishop, J.; Biswas, N.; Busenitz, J.; Cason, N.; Cunningham, J.; Gardner, R.; Grenquist, S.; Kenney, V.; Mannel, E.; Mountain, R.; Shephard, W.; Baumbaugh, A.; Knickerbocker, K.; Wegner, C.; Yarema, R.; Rogers, A.; Kinchen, B.; Ellis, J.; Mead, R.; Swanson, D. (Notre Dame Univ., IN (USA). Dept. of Physics; Fermi National Accelerator Lab., Batavia, IL (USA); Synergistic Detector Designs, Mountain View, CA (USA); Collimated Holes, Inc., Campbell, CA (USA)). Oct 1985. Contract AC03-84ER80146;AC02-76CH03000. 5p. (CONF-851009—73). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010430/JAW.

From IEEE nuclear science symposium; San Francisco, CA, USA (23 Oct 1985).

A fiber-optic plate imaging system has been developed for active target and tracking applications, in which the active element is Ce(3+) in a silicate glass. Particle tracks and interactions have been recorded with a hit density of {approx<-gt}4/mm for minimum ionizing particles and with a spatial resolution σ {similar<-to} 28μm.

37574 **Energy response of agar-alanine phantom dosimeter to gamma radiation.** Ciesielski, B.; Wielopolski, L.; Reinstein, L.E. (Brookhaven National Laboratory, Medical Department, Upton, New York 11973). *Medical Physics;* **15**: No. 3, 380-383(May 1988).

Calculations of the energy response of an electron paramagnetic resonance (EPR) signal induced by gamma radiation in an agar-alanine phantom dosimeter are presented. Theoretically calculated slopes of the EPR signal calibration lines are comparable with those obtained experimentally for low-(50 kVp), medium-(662 keV), and high-(15 MVp) energy photons. The sensitivity of the phantom dosimeter (EPR signal amplitude/Gray) varies less than 2% within the 150- to 20-MeV energy range. For energies above 150 keV, the influence of variations in the size of alanine crystals is negligible.

37575 **Photosensitive dopants for liquid noble gases.** Anderson, D.F. (to Dept. of Energy, Washington, DC). US Patent 4,733,085. 22 Mar 1988. Filed date 1 Jul 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A method of detecting radiation with an ionization detector is described comprising the steps of: dissolving a photosensitive dopant in a noble gas; liquifying the doped noble gas; placing the doped liquified noble gas in the ionization detector; introducing radiation to be detected into the ionization detector; collecting free ions in the ionization detector; and counting the free ions collected within the ionization detector.

37576 **Fast time-to-digital converter for position-sensitive radiation detectors with delay line readouts.** Harder, J.A. (Brookhaven National Lab., Upton, NY (USA)). *Nuclear Instruments and Methods in Physics Research;* **265**: No. 3, 500-510(15 Mar 1988). Contract AC02-76CH00016.

A fast time-to-digital converter (TDC) has been developed for use with position-sensitive radiation detectors having delay line readouts. The device is recommended for detector applications where high position resolution and low distortion are required at high rates. The device has 2 ns time resolution, less than 0.1% differential nonlinearity, and a recovery time of 70 ns. When used with a detector system having a delay line of temporal length tau, the following performance has been achieved: (1) a position digitization of 1 position resolution element per ns of delay line; (2) an average dead time of (3/4 tau + 70) ns; (3) a maximum incident radiation rate of $\approx$4/tau; and (4) a maximum conversion rate of $\approx$ 1/(3tau). Discriminator circuits reduce pile-up distortion to negligible levels for rates as high as those listed above. Finally, two converters may be connected together for synchronous operation as required by 2-dimensional (chi-γ) detectors.

37577 **Data processing and display algorithms for portable instruments.** Alley, G.T.; Bauer, M.L. (Oak Ridge National Lab., P.O. Box X, Bldg., 3500, Oak Ridge, TN (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 559-561(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

Data processing and display algorithms that have general utility to the processing of statistically poor data and its subsequent presentation on digital or digitally generated analog displays have been developed for microprocessor-based portable radiation instrumentation. By using a modified exponentially weighted filter, the data displayed become easy to interpret in a much shorter amount of time than normally required. The apparent time constant can be dynamically adjusted based on the statistical validity of the data. Related algorithms are used for the simulation of an analog meter movement and handling range changing on digital displays. When used together, these algorithms produce an accurate, stable presentation of data that is also visually pleasing.

37578 **Some solutions to on-line radiological monitoring of difficult streams.** Bauer, M.L.; Ramsey, J.A. (Oak Ridge National Lab., P.O. Box X, Bldg. 3500, Oak Ridge, TN (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 571-574(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

On-line monitoring for radiological contamination of dirty, but normally not radioactive, streams is difficult. Described are several new, low-fouling units that are intended to replace the existing sensors that monitor both beta and gamma activity. A sensor was designed, using a thin-wall Geiger-Mueller tube for beta and gamma sensitivity, to monitor the influent of the sanitary sewage treatment plant. The new design eliminates dead volumes inherent in the old unit by use of a double-layer, helically wound solenoid made of 5/16-in.-OD thin-wall (0.02-in.) Teflon tubing. A 4-L Marinelli beaker-based system that used a 3 x 3 NaI(T1) scintillator was replaced with a multi-layer solenoid of 5/8-in.-OD Teflon. Two units for the detection of beta radiation are also described.

37579 **The effect of detector performance on high countrate PET imaging with a tomograph based on position-sensitive detectors.** Mankoff, D.A.; Muehllehner, G.; Karp, J.S. (Hospital of the Univ. of Pennsylvania, Dept. of Radiology, 3400 Spruce St., Philadelphia, PA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 592-597(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

During dynamic studies, ECT systems employing large position-sensitive detectors are forced to handle high event rates per detector. Since detector performance is likely to change with data rate, it is important to understand the effect of changes in detector behavior on image quality. To determine the ability of the PENN-PET tomograph to perform high countrate scans, the authors studied detector performance up to singles rates in excess of 2 million counts per second per detector. In order to evaluate the quality of images resulting from data acquired at these rates, signal-to-noise ratio analyses were applied to both simulated and experimental high countrate images of a cold spot phantom. Changes in image quality were quantitated, allowing us to test combinations of high countrate event processing techniques to produce optimal high countrate images.

37580 **Simulation studies for cylindrical positron tomography.** Stearns, C.W.; Burnham, C.A.; Chesler, D.A.; Browell, G.L. (Physics Research Lab., Massachusetts General Hospital (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 708-711(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

A VMEbus-based microcomputer system has been used to implement a model for simulation of the flux of gamma rays to cylindrical PET detector systems. The model is capable of tracing over one million photons per hour, and has been used to explore some of the effects of "opening up" planar detector geometries into volumetric imagers. Gross single channel and coincidence rates can be estimated using the model, as well as the distribution patterns of both true and scattered coincidence events in the radial and axial directions. The model demonstrates the increases in scattered coincidences which are encountered in "true" (i.e. no collimation) three-dimensional PET imaging, and underscores the importance of detector energy resolution in managing scattered events. The projection plane view of scattered coincidence events suggests that scatter compensation may be attempted by filtering the projection data by two-dimensional techniques. Combining this "source" model with models of detector properties and reconstruction processes will permit a full simulation of the entire PET imaging session, with exciting prospects for system hardware and software design.

37581 **PC based analysis of gamma-ray spectra.** Chapman, T.C. (Idaho National Engineering Lab., Westinghouse Idaho Nuclear Co., Inc. P.O. Box 4000, Idaho Falls, ID (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 556-558(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

New sophisticated gamma spectral analysis software makes a personal computer based gamma spectroscopy system more capable. The personal computer employs 512 kbytes of RAM and a 20 Mbyte hard disk. Spectral analysis uses algorithms adapted from a minicomputer version of the GAUSS V code and optimized for use on a personal computer. particular care was taken to optimize the peak search and baseline determination functions. Correction for background peak contributions to the spectra is available. Detection limit values are calculated for specified nuclides which are not detected by the measurement. Nuclide identification uses a library of up to 300 nuclides with up to 24 gamma lines for each nuclide. Utilities available include nuclide library editing, energy calibration, and efficiency calibration.

37582 **Mercuric iodide photodetector-cesium iodide scintillator gamma ray spectrometers.** Markakis, J.M. (EG and G Energy Measurements, Inc., Santa Barbara Operations, Goleta, CA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 356-359(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

Scintillation spectrometers with mercuric iodide as the photodetector were evaluated for their spectral response to gammas in the energy range of 60 keV to 1332 keV. A /sup 137/Cs (662 keV) photopeak resolution of better than 5% FWHM was obtained due to the low-noise characteristics and high-quantum efficiency of the mercuric iodide photodetector. Photopeak broadening due to the scintillator, electronic noise, and statistical noise versus gamma energy are detailed.

37583 **A rich MWPC pad readout by using Custom Microplex I.C.** Dhawan, S.K.; Grudberg, P.; Venkateramania, H.; Woods, C. (Gibbs Lab., Yale Univ., New Haven, CT (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 436-440(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

Custom Microplex I.C.'s are used to directly readout 10,800 pads of a RICH photon detector MWPC. Analog pedestal substraction for every pad, digitization, sparsification and hit list are made on the fly while reading serial analog data from the microplex chips. The overall system uses less than 100 cables. Cost per channel for electronics and pads are $4.00 and $1.07 respectively.

37584 **The ring imaging Cherenkov detector for Fermilab experiment 665.** Coutrakon, G.B.; Dhawan, S.; Schuler, P. (Fermilab, Batavia, IL (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 470-474(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

The authors describe a ring imaging Cherenkov counter (RICH) which uses a multiwire proportional chamber (MWPC) with cathode pad readout as a UV photon detector. The detector has 10800 pads, each connected to a charge sensitive amplifier, within an area of 55 x 95 cm/sup 2/. The detector offers high data rate capability and a chamber sensitive time of less than 250 nsec. In addition, the detector has 1 mm spatial resolution and a multi-hit capability of about 50 photons/event.

37585 **Low-background-rate detector for ions in the 5- to 50-keV energy range to be used for radioisotope dating with a small cyclotron.** Friedman, P.G. Berkeley, CA; Univ. of California (1986). 79p. University Microfilms Order No. 87-17,982.

Thesis (Ph. D.).

Accelerator mass spectrometry in tandem Van de Graaff accelerators has proven successful for radioisotope dating small samples. Small, inexpensive cyclotrons serving this purpose would make the technique accessible to more researchers and inexpensive enough to compare many small samples. To this end, VC Berkeley is developing a 20-cm-diameter, 30- to 40-keV cyclotron dedicated to high-sensitivity radioisotope dating, initially for ^{14}C. At this energy, range and dE/dx methods of particle identification are impossible. Thus arises the difficult problem of reliably detecting 30- to 40-keV ^{14}C at 10^{-1} counts/sec in the high-background environment of the cyclotron, where lower energy ions, electrons, and photons bombard the detector at much higher rates. To meet this challenge, an inexpensive, generally useful ion detector was developed that allows dark-count rates below 10^{-4} counts/sec and excellent background suppression. With the cyclotron tuned near the ^{13}CH background peak, to the frequency for ^{14}C, the detector suppresses the background to 6 x 10^{-4} counts/sec. For each ^{14}C ion, the detector's grazing-incidence Al_2O_3 conversion dynode emits about 20 secondary electrons, which are independently multiplied in separate pores of a microchannel plate. The output signal is proportional to the number of secondary electrons, allowing pulse-height discrimination of background.

4402 Radiation Effects On Instrument Components, Instruments, Or Electronic Systems

37586 (AERE-R—12916) CREAM - a Cosmic Radiation Effects and Activation Monitor for space experiments: Pt. 1. Design and construction of experimental packages for flight on a NASA Shuttle mission. Mapper, D.; Stephen, J.H.; Farren, J.; Stimpson, B.P.; Bolus, D.J.; Ellaway, A.M. (UKAEA Harwell Lab. Instrumentation and Applied Physics Div.). Dec 1987. 64p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753984/JAW.

Final report for RAE, Farnborough.

A detailed account is given of the design and construction of the experimental CREAM packages, intended for flight in the mid-deck area of the Space Transport System (Shuttle) Mission in 1986. The complete experiment involved; 1) a self-contained and battery powered activation monitor for measuring energy losses of charged particles; 2) CR-39 and Kapton polymer solid state nuclear track detectors for the detection of ionising particles; 3) metal foils of nickel, titanium and gold for neutron monitoring; and 4) thermoluminescent detectors for dosimetry measurements of the radiation background. The circuit design and detailed functioning of the active monitor is fully described, together with a complete discussion of the principles and operation of the passive monitors.

37587 (IKF-IB—66) Description of the universal low-temperature measuring system. Langfeld, R.; Maurer, C. (Frankfurt Univ. (Germany, F.R.). Inst. fuer Kernphysik). Jan 1987. 70p. (In German). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753549/JAW.

There are various measuring methods for a characterization of semiconductor devices, especially for analysis of radiation effects after ion implantation. The four most important methods are: 1. Recording of voltage-current characteristics at pn-junctions or Schottky diodes. 2. Determination of the temperature dependence of the electrical resistance, e.g. of amorphous semiconductor layers, by feeding a constant voltage and measuring the current as a function of sample temperature. 3. Measurement of the resistive layer capacitance of a semiconductor diode as a function of the fed blocking voltage and determination of the doping concentration profile. 4. Time-resolved capacitance measurement after abrupt blocking-voltage alterations at pn - or Schottky diodes as a function of specimen temperature for determining defects in semiconductors, DLTS method. A measuring equipment has been set up that allows measurements being made in the temperature range between 14 K and 400 K, on up to eight specimens in one temperature test. Operating mode and handling of the computerized measuring program are described.

37588 (SAND—88-0250C) Evaluation of silicon-on-insulator MOS [metal-oxide-semiconductor] transistor response to 10-keV x-ray and cobalt-60 irradiation. Fleetwood, D.M.; Tsao, S.S.; Winokur, P.S. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 5p. (CONF-880730—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88006102/JAW.

From 25. annual conference on nuclear and space radiation effects; Portland, OR, USA (12 Jul 1988).

This front-gate, back-gate, and sidewall response of SIMOX and ZMR MOS transistors to 10-keV x-ray and Co-60 irradiation is compared for SOI devices with and without hardened sidewall passivation. 14 refs., 4 figs.

37589 Total-dose failure mechanisms of integrated circuits in laboratory and space environments. Winokur, P.S.; Sexton, F.W.; Hash, G.L.; Turpin, D.C. (Sandia National Labs., Albuquerque, NM (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **NS-34**: No. 6, 1448-1454(Dec 1987). (CONF-8707112—).

From Annual conference on nuclear and space radiation effects; Snowmass Village, CO, USA (28 Jul 1987).

Total-dose failure mechanisms are identified over a wide range of dose rate for 2K and 16K SRAMs from hardened and commercial CMOS technologies. Failure was defined "parametrically," such that an IC fails if one of its parameters, e.g., static power supply current or timing, exceeds a preset specification following irradiation. These studies demonstrate that the dominant failure mechanisms of SRAMs in space radiation environments are often quite different than those observed at considerably higher laboratory dose rates specified by DoD test guidelines, i.e., 100 to 300 rad(Si)/s. In addition, the total-dose hardness of SRAMs varied significantly between laboratory and space dose rates. Several approaches are discussed for predicting total-dose hardness of ICs in space from laboratory measurements. Results are also presented for transistors irradiated over the same range of dose rate (200 to 0.02 rad(Si)/s) and at all biases, i.e., N-on/off and P-on/off. These transistor measurements are used to characterize the physical mechanisms that govern the radiation response of the more complex SRAMs. In a surprising result, a dose-rate dependence for the buildup of radiation-induced interface states was observed. At dose rates from 200 to 0.02 rad(Si)/s, the number of interface states at a given total dose increased as the dose rate decreased.

37590 (CONF-880277—2) A new automated continuous emissions monitor for incinerators. McIntosh, M.J.; Erickson, M.D.; Demirgian, J.C. (Argonne National Lab., IL (USA)). Jan 1988. Contract W-31109-ENG-38. 10p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010031/JAW.

From Pacific Basin conference on hazardous waste; Honolulu, HI, USA (1 Feb 1988).

Many of the problems as well as the needs of hazardous waste incineration (HWI) are related to stack emissions measurements. In this paper these problems and needs are briefly outlined and some of the characteristics a desired monitor should have are discussed. The theory of Fourier Transform Infrared Spectroscopy (FTIR) and its advantages are discussed. Some recent results are given relative to emissions monitoring by a system based on FTIR, which show that many of the monitoring needs of HWI may be met by such a system. Some of the future possibilities for this type of monitoring are discussed.

37591 (CONF-880740—4) Some observations of acoustic cavitation in water at 1 MHz. Cha, Y.S.; Sheen, S.H.; Lawrence, W.P.; Raptis, A.C. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 21p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010079/JAW.

From Cavitation and multiphase forum; Cincinnati, OH, USA (24 Jul 1988).

The results are summarized: (1) Nuclei distrubution in fresh tap water changes rapidly with time within the first hour after water has been poured into the tank. It is difficult to reproduce the experimental results at relatively low powers within this period. (2) The most violent action (cavitation and streaming) was observed in tests with fresh tap water. The presence of a reflector enhanced the cavitation activity significantly. Stable bubble pattern with stationary bubbles were observed for most of the tests conducted with a long waiting time and without the presence of a reflector. (3) Sometimes four distinctive types of bubble behavior can be observed in one experiment. For example, at relatively high powers in tests with long waiting time and with the presence of a reflector, it was observed that there were stationary bubbles, rising bubbles, dancing bubbles, and streaming bubbles. (4) For tests conducted with long waiting time, no bubbles were observed even when input power was increased to a very high values (100 volts). However, bubbles can be made to appear suddenly by pertubing the frequency away from 1 MHz. Once the bubbles appear, they remain even when the frequency is returned to 1 MHz. This triggering phenomenon may be partly related to hysteresis. (5) The bubbles are gas (not vapor) since most of them gradually rise to the surface when the power is turned off. (6) At relatively high powers ({approximately 100 volts}, strong streaming and pulsing were observed. A group of bubbles was observed to move suddenly in the

direction away form the transducer. This pulsing action does not occur at a fixed interval. 9 refs., 8 figs.

37592 **(CONF-8708180—12) Experimental demonstration of producing high resolution zone plates by spatial-frequency multiplication.** Yun, W.B.; Howells, M.R. (Argonne National Lab., IL (USA); Lawrence Berkeley Lab., CA (USA)). 1987. Contract W-31-109-ENG-38. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88012032/JAW.

From Symposium on X-ray microscopy; Upton, NY, USA (31 Aug 1987).

In an earlier publication, the possibility of producing high resolution zone plates for x-ray applications by spatial-frequency multiplication was analyzed theoretically. The theory predicted that for a daughter zone plate generated from the interference of mth and nth diffraction orders of a parent zone plate, its primary focal spot size and focal length are one (m + n)th of their counterparts of the parent zone plate, respectively. It was also shown that a zone plate with the outermost zone width of as small as 13.8 nm might be produced by this technique. In this paper, we report an experiment which we carried out with laser light (λ = 4166A) for demonstrating this technique. In addition, an outlook for producing high resolution zone plates for x-ray application is briefly discussed.

37593 **(DOE/ER/13487—3) Effects of the nature of the solvent and solutes on the response of a light scattering detector.** Righezza, M.; Guiochon, G. (Tennessee Univ., Knoxville (USA). Dept. of Chemistry; Oak Ridge National Lab., TN (USA)). [1988]. Contract FG05-86ER13487. 50p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010648/JAW.

The effects of the nature of the solvent and solutes on the response of an evaporative light scattering detector (ELSD) are discussed. Data have been measured for six solutes with seven different solvents using concentric and cross-flow nebulizers. The experimental results suggest that the influence of the solvent on the properties of a dried aerosol are not properly accounted for by the equation of Nukiyama and Tanassawa. A modification of the droplet size distribution of the aerosol takes place, probably during the vaporization of the solvent. The amount of scattered light depends strongly on the molar absortivity of the solute at the light beam wavelength. Accordingly, the detector response depends on the properties of the solvent and the solute. The ELSD is not a mass detector and calibration is required for quantitative analysis. 19 refs., 9 figs.

37594 **(DOE/ER/13718—1) Fourth international symposium on accelerator mass spectrometry: Program and abstracts.** (Rochester Univ., NY (USA)). 1987. Contract FG02-87ER13718. 132p. (CONF-8704112—Absts.). NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88008765/JAW.

From 4. international symposium on accelerator mass spectrometry; Ontario, Canada (27 Apr 1987).

This report contains abstracts of papers on mass spectrometry from the international symposium on accelerator mass spectrometry. (LSP)

37595 **(EGG—10617-5003) Streak tube evaluation procedures at EG&G/EM, Los Alamos Operations.** Baker, S.; Whiteson, A.; Jennings, T. (EG and G Energy Measurements, Inc., Los Alamos, NM (USA). Los Alamos Operations). May 1988. Contract AC08-88NV10617. 63p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009567/JAW.

This manual describes the tests used at EG and G Energy Measurements, Inc., Los Alamos Operations (LAO) to characterize streak tubes. Both resolution (static, dynamic spatial, and dynamic temporal) and radiometric (linearity and radiant gain, extinction ratio, opacity, and quantum efficiency/photocathode uniformity) measurements are covered,a nd the significance of these measurements with respect to streak camera applications is discussed. Results from characterization tests done on a typical streak tube have been included in these tests as examples.

37596 **(GKSS—86/E/69) Computer controlled microdensitometer and some applications.** Greim, L.; Greim, M.; Schmitz, H.W.; Schumacher, G.W. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1986. 11p. (CONF-8606235—). Reprint from: Barton, J.P.; Farny, G.; Person, J.L.; Roettger, H. (eds.): Neutron radiography. Proceedings of the 2. world conference. Dordrecht: Reidel (1986) p. 669-677.

From 2. world conference on neutron radiography; Paris, France (16 Jun 1986).

Microdensitometry on neutron radiographs enables quantitative evaluations of images. The measuring set up presented consists of the Jenoptic Schnellphotometer G III with several essential alterations and extensions. The densitometer was equipped with a photodiode which has a fast and linear response over a measuring range of 6 powers of ten. A travelling tabel can be moved by step motors in x- and y-directions over an area of 150x250 mm, step length 10 μm. The scanning program is controlled by minicomputer, with a speed of about 5 measurements per second. Data processing and evaluation is done on- and off-line. Some applications are presented: the examination of several resolution functions, as well as the scanning and fitting for the evaluation of radiographs of the Euratom calibration fuel pin and of the AFNOR IQI and of a proposed L/D standard.

37597 **(IAE—4426/14) Four-channel digital recording system of single process form for study solid properties in pulsed high magnetic fields.** Bessonova, N.A.; Kapustin, G.A.; Meleshko, E.A.; Morozov, A.G.; Olejnik, S.V.; Ostashev, I.E.; Palkin, Yu.Yu. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1987. 24p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702855/JAW.

The four-channel measurement system developed for high-efficiency digital recording and reproduction of the single and rare-recurrent process shape is considered. The 10-capacity bipolar analog-to-digital converter (ADC) with maximum frequency of quantization 10 MHz is used in the system. The measurement system is designed for carrying out investigations related to the effect of pulsed high magnetic fields on solids. Problems concerning the development of high-speed pulse signal recorders based on specialized ADC are considered. Short notices of measurement system operation at the installation for pulsed high magnetic fields are given. 15 refs.; 6 figs.

37598 **(IFVE-OP—87-122) Hardware and software for TV measurement technique study.** Gusak, A.A.; Dubasov, Yu.B.; Novikov, V.N.; Romanov, Yu.A.; Serga, E.V.; Kharlamov, A.V.; Khodyrev, Yu.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 22p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702860/JAW.

Hardware and software which allow to build a model of TV measurement system, to study its parameters and to train measurement algorithms are considered. The capabilities of the complex offered are shown at the examples of TV systems for image analysis in microscopy, beam diagnostics and parameter measurements of the position sensitive photodetectors. 18 refs.; 12 figs.

37599 **(ITEF—140(1987)) SM computer interface with ADAPTER non-standard external equipments.** Bezuglov, M.P.; Bobchenko, B.M.; Gushchin, O.B.; Zhurkin, V.V.; Zavrazhnov, G.N.; Sergeev, N.K. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 13p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702888/JAW.

SM computer interface with ADAPTER non-standard external equipments is described. The communication system developed is constructed according to the principle of independent interface units, every of which provides the communication with the external equipment. A flowsheet of the "ADAPTER", which main elements are an address switch, an address decorder, a data switch and a

control device for "ADAPTER" operating in program and direct memory access modes, is presented. Sampling of addresses for non-standard external equipments and algorithms of block operation in different exchange modes are considered. 3 figs.

37600 **(JINR-R—10-87-550) CAMAC interface with a micro-computer.** Le Dinh Lam; Nguyen Ngoc Hoan; Nguyen Manh Shat. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics; Inst. Fiziki NTsNI, Khanoj, SRV). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1987. 4p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702938/JAW.

The CAMAC interface with the M6800 micro-computer is described. A new approach to criterion of the CAMAC controller is developed. It permits to provide the increase in the reliability of data acquisition system in physical experiments, as well as that of storage and data processing. Algorithm of program for data reading from 2249A ADC unit is described. The interface is located in a single CAMAC module and occupies the 25th position in crate. The velocity of data transfer between micro-computer and CAMAC system is 1 Mbit/s. 4 refs.; 2 figs.; 1 tab.

37601 **(LA-UR—88-1303) An electronic shadowgraph station and control system.** Holt, D.M.; Winchenbach, G.L. (Los Alamos National Lab., NM (USA); Air Force Armament Lab., Eglin AFB, FL (USA)). 1988. Contract W-7405-ENG-36. 10p. (CONF-880592—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009122/JAW.

From 15. AIAA aerodynamic testing conference; San Diego, CA, USA (18 May 1988).

A proof-of-principle electronic shadowgraph station has been installed at the Aeroballistic Research Facility, Eglin Air Force Base, Florida, with encouraging results. This paper reviews the requirements for replacing a film system for aeroballistics measurements with an electronic imaging and processing system, with particular emphasis on using centroid and second moment of inertia algorithms to improve the accuracy. The proof-of principle electronic shadowgraph station is described and results of comparative measurements at the facility between film and digitized video images show comparable accuracy. 6 refs., 16 figs., 2 tabs.

37602 **(LBL—23988) Microprocessor-controlled personal dosimeter for recording low-intensity, power-frequency magnetic fields.** Tenforde, T.S. (Lawrence Berkeley Lab., CA (USA)). Aug 1987. Contract AC03-76SF00098. 51p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008404/JAW.

A portable dosimeter has been developed for monitoring human exposure to power-frequency magnetic fields in residential and occupational environments. This microprocessor-controlled dosimeter has been designed to measure 60-Hz field intensities from 20 μG to 600 mG (r.m.s. values), thereby covering the broad range of field levels generally encountered in households and occupational settings. Field detection is accomplished by three orthogonal 500-turn coils, each of which is enclosed in a copper chamber to provide shielding from ambient electric fields. A digitized resolution of 2.5 μG is provided in the 20 μG to 10 mG range, and 150 μG resolution in the 10 mG to 600 mG range. A bench-mounted HP85 computer is used to initialize the data acquisition program during start-up of the portable dosimeter. The HP85 also retrieves data from the random-access memory through an RS-232-C serial interface when the field monitoring is completed. Calibration tests have demonstrated that linearity of the dosimeter's detection system is within 2% over the field range of 50 μG to 600 mG. Contamination of the main 60-Hz signal by harmonics was found to be less than 1%. Tests of the dosimeter's performance in an electronics laboratory, a 230-kV substation, and a residential environment have demonstrated that it meets the original design specifications. Several design improvements that would reduce the dosimeter's physical size and extend its versatility for long-term field monitoring are discussed.

37603 **(PNL—6537) Direct measurement of solids: High temperature sensing: Experimental development and testing of high temperature pulsed EMATs [electromagnetic acoustic transducer]: Final report.** Boyd, D.M.; Spanner, G.E.; Sperline, P.D. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 60p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009859/JAW.

A pulsed laser/pulsed EMAT (electromagnetic acoustic transducer) receiver system has been demonstrated for measuring the time of flight of acoustic signals in hot steel samples. Attenuation and signal-to-noise ratio are important parameters to be monitored. A continuous contact EMAT application was not achieved; thermal analysis found that contact times of 5 seconds with cooling times of 45 seconds are required at 1300{degree}C. The equipment requires field hardening and improved packaging before system reliability can be assessed. 22 refs., 35 figs. (DLC)

37604 **(PNL-SA—14755) US Department of Energy Radiological Calibration Intercomparison Program.** Cummings, F.M.; Endres, G.W.R. (Pacific Northwest Lab., Richland, WA (USA)). Nov 1987. Contract AC06-76RL01830. 4p. (CONF-880404—7). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008192/JAW.

From 7. international congress of the International Radiation Protection Association; Sydney, Australia (10 Apr 1988).

This paper discusses the procedures and equipment used in the United States Department of Energy Radiological Calibration Intercomparison Program. (LSP)

37605 **(SAND—88-0197C) Acoustic plate mode devices as liquid phase sensors.** Ricco, A.J.; Martin, S.J.; Frye, G.C.; Niemczyk, T.M. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-8806132—1). NTIS, PC A03/MF A01. Order Number TI88010227/JAW.

From Solid state sensors workshop; Hilton Head, SC, USA (6 Jun 1988).

Acoustic plate mode (APM) devices are sensitive to mass accumulated on and removed from a solid surface immersed in a liquid, as well as solution viscosity, density, electrical conductivity, and dielectric coefficient. Operating in direct contact with liquid solution at 158 MHz, APM devices have been used to monitor electrodeposition, electroless deposition, and metal film corrosion. Calibration of a 0.19 mm thick ST-quartz APM sensor by vacuum deposition of a silver film yielded a sensitivity of less than 1 ng/cm^2. Comparison of the frequency shift during Ag deposition to that obtained upon aqueous dissolution of the same Ag film demonstrates that the sensitivity to mass loading is not measurably altered by liquid contacting the device surface. Monitoring the propagation loss of the acoustic wave, which is proportional to viscosity over the 0.3 to 80 cP range, allows use of an APM device as a solid-state viscosity sensor. Acoustoelectric coupling between the APM and solution results in a velocity perturbation which depends on ionic conductivity and solution dielectric coefficient. 16 refs., 5 figs.

37606 **(Y/DW—781) Acoustic emission calibration instrumentation.** Duncan, M.G.; Whittaker, J.W. (Oak Ridge Y-12 Plant, TN (USA)). 13 Nov 1987. Contract AC05-84OS21400. 34p. (CONF-880425—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010817/JAW.

From IEEE instrumentation and measurement technology conference; San Diego, CA, USA (20 Apr 1988).

An automatic calibration instrument was developed to improve calibration accuracy of acoustic emission (AE) transducers by one order-of-magnitude over commercially available equipment. The instrument facilitates calibration by automatically displaying the maximum value of the stress used to produce AE calibration pulses and the AE pulse. Low-noise amplifiers and filters were also developed to improve the sensitivity of AE measurements by more than one order-of-magnitude over commercially available instruments; thus smaller signals may be detected in parts. 1 ref., 10 figs.

37607 **Atmospheric isoplanatism and astronomical image reconstruction on Mauna Kea.** Cowie, L.L.; Songaila, A. (Institute for Astronomy, University of Hawaii, 2680 Woodlawn Drive, Honolulu, Hawaii 96822). *Journal of the Optical Society of America A: Optics and Image Science;* 5: No. 7, 1015-1022(Jul 1988).

Atmospheric isoplanatism for visual wavelength image-reconstruction applications was measured on Mauna Kea in Hawaii. For most nights the correlation of the transform functions is substantially wider than the long-exposure transform function at separations up to 30 arcsec. Theoretical analysis shows that this is reasonable if the mean Fried parameter is approximately 30 cm at 5500 A. Reconstructed image quality may be described by a Gaussian with a FWHM of λ/s_0. Under average conditions, s_0 (30 arcsec) exceeds 55 cm at 7000 A. The results show that visual image quality in the 0.1—0.2 arcsec range is obtainable over much of the sky with large ground-based telescopes on this site.

37608 **Static gas analysis by a transient flow technique.** Leckey, J.H.; Boeckmann, M.D. (Oak Ridge Y-12 Plant, Chemistry and Chemical Engineering Department, Development Division, Martin Marietta Energy Systems, Inc., Oak Ridge, Tennessee 37831). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 6: No. 4, 2514-2517(Jul 1988).

A technique is presented for using a residual gas analyzer (RGA) to analyze small concentrations of heavy gases in lighter gases in a static volume of <10 cm^3. Passing the gas sample through a control valve causes it to enter the RGA chamber in molecular flow. This procedure results in fractionation that causes enrichment of the heavier gas during the evacuation of the sample, giving rise to a significantly higher heavy gas signal near the end of the evacuation, while maintaining low pressures in the RGA chamber that are required for linearity. This heavy gas enrichment near the end of the evacuation results in a significant reduction in its detection limit. Specific examples are presented for the analysis of argon in hydrogen and are compared to a gas-flow model of the system.

37609 **Polarization analyzer for high energy pulsed laser beams.** Roberts, T.G.; Otto, W.F.; Gamble, W.L.; Honeycutt, T.E. (to Secretary of the Army, Washington, DC). US Patent 4,737,643. 12 Apr 1988. Filed date 30 Dec 1985. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A polarization analyzer for an energy laser beam is described comprising a wire resistor wound such that it presents straight line segments each in a single plane and parallel to each other, first means connected to the resistor so as to position the plane such that the laser beam will be substantially perpendicular to the plane and will impringe on at least a portion of the segments so as to cause heating of the resistor in accordance to the average power output of the beam and its polarization position relative to the alignment of the segments. First measurement means connect to the wire resistor for measuring the resistance of the resistor. One raceway means connect to the first means so as to allow rotation of the segments within the plane. Second measurement means connect to the first means and the raceway means for measuring the angle of rotation of the segments relative to a predetermined angle position of the segments relative to the raceway, and the first means are rotated so as to allow measurements to be made about the angles of rotation of the segments.

37610 **Josephson junction q-spoiler.** Clarke, J.; Hilbert, C.; Hahn, E.L.; Sleator, T. (to Dept. of Energy, Washington, DC). US Patent 4,733,182. 22 Mar 1988. Filed date 25 Mar 1986. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

This patent describes a detection system for detecting the gyroprecessional resonance of a specimen having a particle system with magnetic or electric dipole moments comprising: means for irradiating the specimen with a pulse of high frequency radiation, detector means for detecting signals produced by magnetic resonance of the specimen, a dc SQUID having a superconducting ring and two shunted Josephson tunnel junctions interrupting the ring, the ring having a bias current input at one side thereof between the junctions and a bias current output at the other side thereof between the junctions, means for establishing a constant magnetic flux threading the SQUID ring, means for supplying a bias current to the bias current input of the SQUID, an input coil inductively coupled to the SQUID ring, and a resonant circuit coupling the detector means to the input coil.

37611 **Sphericity measurements of full spheres using subaperture optical testing techniques.** Beery, T.A.; Lawrence, G.N.; Day, R.D. (Los Alamos National Lab. (US)). pp 334-341 of Optical testing and metrology. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1986). (CONF-860620—).

From Society of Photo-Optical Instrumentation Engineers international symposium: topics in optical and optoelectronic applied sciences and engineering; Quebec City, Canada (2 Jun 1986).

This paper discusses the progress being made on the development of applying subaperture interferometric testing techniques to making sphericity measurements on the entire surface of a full sphere.

4404 Well Logging Instrumentation

37612 **Neutronic properties of Mesaverde Sands: Pt. 2. Results.** Lysne, P. (Sandia National Labs., Albuquerque, NM (USA)). *Nuclear Geophysics;* 2: No. 2, 113-122(1988).

Thermal neutron absorption cross section measurements were conducted on one hundred and twenty specimens obtained from the Mesaverde formation. Specimens comprised entirely of claystone, mudstone, siltstone and coal were found to have the largest cross sections with typical values in the range of 6-10 CU(gmcm^3). Alternatively, specimens with 1% or less clast or parting material, possess cross sections of 4.2 +- 0.6 CU(gmcm^3) for Mesaverde as a whole, whereas some individual units are characterized by nearly uniform cross section values. A petrographic analysis enabled an estimate of the shale water content and this information, together with the cross section values, was used to estimate the uncertainty in neutron porosity logs. This uncertainty is about +- 3 volume percent and it is due more to uncertainty in the shale water content than to jitter in the matrix cross section values.

37613 **(AD-A—190124/8/XAB) Buckling of blast-loaded cylinder. Final report, 1985-1986.** Santiago, J.M.; Klaus, M.H.; Wisniewski, H.L. (Army Armament Research and Development Command, Aberdeen Proving Ground, MD (USA). Ballistics Research Lab.). Oct 1987. 52p. (BRL-TR—2863). NTIS, PC A04/MF A01.

The transient response of a thin-walled aluminum cylinder subjected to an enveloping shock wave was simulated with the ADINA finite-element program, and the results are compared with counterpart experimental data. The analysis employed the ADINA 16-noded rectangular curved shell. Using linear analysis, the computed strain histories at gage locations were found to correlate reasonably well with test records for the first four milliseconds, but some strain records rapidly diverged thereafter. A subsequent nonlinear analysis showed dynamic buckling to be the principal cause of this discrepancy. The nonlinear calculations and test results were found to generally agree in the number of buckling nodes, The magnitude of the deformation, and frequencies excited, although buckling sensitivity to imperfections prevented an exact coincidence of circumferential modes.

37614 (AD-A—190607/2/XAB) Dynamic test of a corrugated steel keyworker blast shelter MISTY PICTURE. Final report. Holmes, R.L.; Slawson, T.R.; Harris, A.L. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Structures Lab.). Nov 1987. 93p. (WES/TR/SL—87-31). NTIS, PC A05/MF A01.

The 18-man blast shelter was tested dynamically on May 14, 1987 in the MISTY PICTURE event at White Sands Missile Range, NM. The main section of the shelter was fabricated from a 9-foot-diameter, 27.5-foot-long section of 10-gage, galvanized, corrugated steel culvert. The shelter included a vertical entryway and air intake and exhaust stacks. The shelter design was found to be conservative during a previous 50-psi validation test, and some constructibility problems were encountered with the entryway-to-shelter connections. This test was conducted to validate the modifications made to the shelter design. The modifications were made to reduce construction costs and improve constructibility. Primary modifications included: replacing the stiffened endwalls with lighter-weight unstiffened plates, connecting the entryway to an endwall rather than to the main section of the shelter, and the inclusion of an emergency exit. The structure was located at the anticipated 200-psi peak overpressure level. Post-test inspection revealed that the main section of the shelter suffered very little damage during the test. Due to the failure of the emergency exit cover plate, it was necessary to determine if enough pressure entered the shelter to affect its structural response. This test also investigated the shock environment inside the shelter.

37615 (CONF-880724—20) Experimental and analytical study of vapor explosions in stratified geometries. Anderson, R.; Armstrong, D.; Cho, D.; Kras, A. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 9p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011964/JAW.

From 25. American Society of Mechanical Engineers/American Institute of Chemical Engineers/American Nuclear Society national heat transfer conference; Houston, TX, USA (24 Jul 1988).

Vapor explosions in stratified geometries were experimentally studied. The unpredictable stability of stratified systems in a horizontal orientation made them poor experimental subjects. Stratified explosions were successfully generated in a vertical, transparent, fully confined pressure vessel. The explosion propagated with a sharp front and a narrow reaction zone where the two liquids mixed and the cold liquid boiled. Behind the explosion wave the system was in local equilibrium. If two liquid layers of the same thickness mixed and came to 100% equilibrium they would need a total mixture depth of 6 mm to explain the measured equilibrium pressure. Less efficient reactions would require greater mixing depths. A comprehensive model of stratified explosions must include the strong two-dimensional effects.

37616 (LA—11239-MS) Numerical modeling of the effect of particle size of explosives on shock initiation properties. Mader, C.L.; Kershner, J.D. (Los Alamos National Lab., NM (USA)). Mar 1988. Contract W-7405-ENG-36. 22p. NTIS, PC A03. Order Number DE88010479/JAW.

The three-dimensional Eulerian reactive hydrodynamic code 3DE has been used to investigate the effects of particle size and the resulting void or hole size on the shock initiation of heterogeneous explosive charges of TNT. Shocks interacting with TNT containing various hole sizes have been modeled. The void fraction was held at 0.5% while the spherical hole sizes were varied from 0.5- to 0.0005-mm radius, and the TNT was shocked to 12.5 GPa. As the hole size was varied from 0.5 to 0.05 mm, the explosive became more sensitive to shock as the hole size decreased, and the number of hot spots increased. When the hole size was decreased to 0.0005 mm, a 12.5-GPa shock wave failed to build toward propagating detonation because the resulting hot spots were cooled by side rarefactions before appreciable decomposition occurred. At the same density, the most shock-sensitive explosive will be that with particle sizes between coarse and extremely fine material. 11 refs., 6 figs., 2 tabs.

37617 (LA-UR—88-1157) Decomposition of energetic materials on the drop-weight impact machine. Buntain, G.A.; McKinney, T.; Rivera, T.; Taylor, G. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 14p. (CONF-880693—3; CONF-880693—). NTIS, PC A03;3. Order Number DE88009154/JAW.

From 19. international ICT conference on combustion and detonation; Karlsruhe, F.R. Germany (29 Jun 1988).

The drop-weight impact test is essential for initial characterization of limited amounts of new energetic materials. The mechanisms for reaction of energetic materials on the drop-weight machine are largely unknown. Partly as a consequence of this lack of understanding, results obtained on the drop-weight machine are often misleading and inconsistent. We are investigating mechanisms for decomposition of explosives on the drop-weight machine using radiometric and spectroscopic methods. Initial radiometric results reveal consistent, sequential emissions for specific impacted explosives that probably correspond to time-resolved chemical reactions. Time-resolved C_2^* emission has been tentatively identified using spectroscopic methods to examine impacted explosives. 11 refs., 9 figs.

37618 (MLM—3505) Relative flow rates of explosive powders. Willson, V.P. (Monsanto Research Corp., Miamisburg, OH (USA). Mound). 31 May 1988. Contract AC04-76DP00053. 14p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010767/JAW.

A study was performed to determine the relative flow rates of various explosive powders and evaluate their adaptability for use in automated dispensing systems. Results showed that PBX 9407, LX-15, RX-26-BH, and HNAB are potential candidates for use in these systems. It was also shown that powders with graphite and stearate additives generated the least amount of static and were the easiest to handle.

37619 (SAND—87-3032C) Diode laser ignition of high explosives and pyrotechnics. Kunz, S.C.; Salas, F.J. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 19p. (CONF-880750—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008771/JAW.

From 13. international pyrotechnics seminar; Grand Junction, CO, USA (11 Jul 1988).

Thermal ignition of the explcsive CP (2-[5-cyanotetrazolato]pentaamine cobalt (III) perchlorate) and of the pyrotechnic Ti/$KClO_4$ has been achieved using a (GaAl)As diode laser that emitted 1 watt of optical power from the end of a 100{minus}μm core fiber optic to which it was coupled. The wavelength of the emitted light was near 820 nm. Approximate ignition thresholds were obtained for pulse widths of between 2 and 10 ms. For a 10{minus}ms pulse width, pure CP required {approximately}6.7 mJ of energy for ignition whereas pure Ti/$KClO_4$ required only {approximately}3 mJ. Dopants such as carbon black, graphite and a laser dye were added in small concentrations to enhance light absorption and thereby reduce the ignition theshold. Their effects as well as those of powder density, particle size and spot size of the incident light on ignition threshold are described. 9 refs., 7 figs., 3 tabs.

37620 (SAND—87-3069C) A concept for an electro-optic explosive device. Benson, D.A.; Rose, B.H. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 20p. (CONF-880750—6). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009696/JAW.

From 13. international pyrotechnics seminar; Grand Junction, CO, USA (11 Jul 1988).

Enhancement of the safety and security of explosive devices by solely using fiber optic links to the device has been a development objective in both commercial and military applications. Much effort has centered on the direct ignition of explosive materials by light from an optical fiber. While such devices are beginning to emerge, the need to use high optical power levels ans sensitive explosives has limited the approach. We have explored an indirect, but simple approach to operating an optically coupled detonator/igniter. This method is made possible by recent developments in low voltage explosive igniters combined with microcircuit series-

connected photovoltaic arrays. They allow one to convert light from an optical fiber to electrical energy stored in a small capacitor and to trigger its discharge, all locally within the device to produce a precisely timed explosive ignition and subsequent detonation. This produces a component of about the same size as existing devices, which is highly resistant to electromagnetic disturbances and driven by a diode laser through an optical fiber. The method functions with a wide range of insensitive secondary explosives and pyrotechnics. In this paper we will describe prototypes of the device which we have operated. Performance ranges available with present technology and areas of technology which will be fruitful to develop will be discussed. 15 refs., 9 figs., 1 tab.

37621 **(SAND—87-3095C1) Semiconductor bridge (SCB) igniter studies: 1, Comparison of SCB and hot-wire pyrotechnic actuators.** Bickes, R.W. Jr.; Schlobohm, S.L.; Ewick, D.W. (Sandia National Labs., Albuquerque, NM (USA); Monsanto Research Corp., Miamisburg, OH (USA)). 1988. Contract AC04-76DP00789. 12p. (CONF-880750—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008802/JAW.

From 13. international pyrotechnics seminar; Grand Junction, CO, USA (11 Jul 1988).

Sandia National Laboratories has developed a means for igniting pyrotechnics, propellants and primary or secondary explosives using a semiconductor bridge (SCB) instead of the small metal bridgewires, called hot wires, conventionally used for explosive components. The SCB is a heavily n-doped silicon film, typically 100 μm long by 380 μm wide by 2 μm thick, which when driven with a short (20 μs), low-energy current pulse (less than 3 mJ), generates a hot plasma that ignites the explosives. We report in this paper a study of pyrotechnic actuators built with SCB igniters in which we obtained the Langlie All-Fire, Langlie No-Fire and Electrostatic Discharge (ESD) characteristics. Two SCB designs were tested. The first (designated as a type 3-2) was the rectangularly shaped bridge described above. The second (designated as a type 15) included a modification of the rectangular bridge consisting of a narrow waist region. We compare our data for these prototype SCB components with the same actuators built with conventional hot-wire igniters. The results obtained demonstrated the main characteristics of SCB devices: (1) the SCB actuators functioned at one-tenth the input energy of the hot-wire actuators, (2) had higher no-fire currents than the hot-wire devices, (3) passed ESD tests, and (4) functioned in a few tens of microseconds versus the millisecond response of the hot-wire components. 8 refs., 5 figs., 3 tabs.

37622 **A numerical investigation of high-explosive grain size effects on the performance of boosters.** Tang, P.K. (Los Alamos National Lab., NM (US)). *Combustion and Flame;* 70: No. 1, 61-64(Oct 1987).

Initiation of insensitive high explosives requires use of a boosting system with a more sensitive and typically more energetic explosive. However, problems arise if the booster material is too energetic. The initiability of some insensitive but not so energetic high explosives can be enhanced by lowering the density and decreasing the grain size; thus those explosives can be used as booster materials. A class of experiments, commonly called onionskins, has been used to detect the divergence pattern of the detonation wave and determine the performance of the booster. With reactive burn model in a hydrodynamic code, numerical simulations can be performed to obtain the same objectives. Examples are presented using low-density superfine and ultrafine triaminotrinitrobenzene (TATB) as booster explosives to initiate plastic-bonded TATB-base high explosive.

37623 **(AD-A—190478/8/XAB) Geophysical investigations at Pahute Mesa, Nevada. Final report, 1 February 1985-31 January 1987.** Ferguson, J.F.; Reamer, S.K. (Texas Univ., Dallas (USA)). 12 Aug 1987. 132p. NTIS, PC A07/MF A01.

The seismic response of underground nuclear explosion tests at Pahute Mesa, NV displays variations that correlate with the geologic/geophysical structure. Investigations were performed using borehole, gravity, and wide-angle seismic observations, with the aim of producing a geophysical model of the Silent Canyon caldera structure at Pahute Mesa. Empirical models of the density and seismic velocity were formulated, based on well logs. New gravity stations were obtained in 1985 and merged with older, lower-quality data. A new gravity-modeling technique was developed and applied to the modeling of a transect across the area. The resulting model supports the hypothesis that a high density and velocity blanket at a depth of a few kilometers. In 1986 a wide-angle seismic reflection/refraction survey was completed near the gravity profile. The 15-km-long line crossed the buried caldera boundary as well as important normal faults. The shot point was located on outcropping basement. Future interpretation of the combined gravity and seismic data should permit the construction of a predictive geophysical model.

37624 **(CONF-8806141—1) US Department of Energy Coordination and Information Center.** (Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA)). 1988. Contract AC08-84NV10327. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88011217/JAW.

From 79. annual conference of the Special Libraries Association; Denver, CO, USA (11 Jun 1988).

The purpose of the Coordination and Information Center (CIC) is to provide information relating to fallout from nuclear weapons tests. The CIC's information collection includes: 1)data and documentation on the detection and measurement of radioactive fallout and related factors resulting from U.S. nuclear tests at the Nevada Test Site, the Trinity test in New Mexico, the Pacific Proving Grounds, and other on-continent test locations; 2)policy documents on conducting nuclear tests and public safety; 3)documents describing the state-of-knowledge of biological effects of radiation; 4)documents on public information, such as AEC news releases, newspaper, magazine, and journal articles; and 5)related scientific and technical studies and reports concerning nuclear tests. Each document in the CIC collection is entered into a bibliographic data base which is searchable by CIC staff members.

37625 **(GAO/RCED—87-134) Nuclear health and safety: Radiation exposures for some cloud-sampling personnel need to be reexamined.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 1987. 87p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Between 1945 and 1962, nearly 200,000 Americans participated in the atmospheric nuclear weapons testing program, with more than half receiving some level of radiation exposure. In 1985, a public interest group reported that a radiation monitoring device installed inside aircraft that had penetrated the nuclear clouds read more than twice the level of radiation recorded on film badges worn by the aircraft crews suggesting that a reexamination of radiation exposure should be made. Ground personnel working on the testing program did not consistently wear protective breathing devices when working around radioactive materials.

37626 **(GAO/RCED—88-25BR) Nuclear test lobbying: DOE regulations for contractors need reevaluation.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 1987. 45p. General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

Allegations had been made that the Department of Energy was improperly employing contractors to assist in lobbying the Congress on nuclear weapons testing issues. The antilobbying criminal statute has been interpreted by the Department of Justice as allowing federal officials to provide information to the Congress and to state their views on proposed legislation but prohibits "grass-roots" lobbying by federal employees. Thus, DOE's extensive briefings of congressional Members and staff to influence their views on nuclear weapons testing issues did not violate applicable statutory provisions.

37627 **(LA—11226-MS) Roles for neutral particle beams in strategic defense.** Canavan, G.H.; Browne, J. (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 122p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010476/JAW.

Neutral particle beams can play a number of unique, critical roles in strategic defense because of their robust mechanism for discrimination and kill. Their operation, status, and applications are evaluated, showing that their near term roles are complementary to kinetic energy weapons. In addition, particle beams are shown to be the primary candidates for interrogating space objects, discriminating numerous light decoys possible in midcourse, and eliminating reentry vehicles among them.

37628 **(LA—11244-MS) Defensive platform size and survivability.** Canavan, Gregory H. (Los Alamos National Lab., NM (USA)). Jun 1988. Contract W-7405-ENG-36. 40p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011634/JAW.

This report discusses the survivability of space platforms, concentrating on space based kinetic energy interceptors. It evaluates the efficacy of hardening, maneuver, self-defense, and deception in extending the survivability of platforms of varying sizes to expected threats, concluding that they should be adequate in the near and mid terms.

37629 **(LA—11285-MS) Directed energy architectures.** Canavan, G.H. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 58p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010484/JAW.

This report discusses the roles directed energy could play in strategic defense, assesses their likely effectiveness, and outlines the important complementarity between directed and kinetic energy, which appears to be pivotal to the development of robust defenses. Directed energy concepts could provide adequate kill rates that are relatively insensitive to fast, compact launches. Midcourse applications are based on the robust discrimination ability of directed energy weapons.

37630 **(SAND—87-8229) Response of a thin cylindrical shell under lateral impulse loads.** Prantil, V.C. (Sandia National Labs., Livermore, CA (USA)). Mar 1988. Contract AC04-76DR00789. 78p. NTIS, PC A05;3. Order Number DE88008071/JAW.

In support of the current directed energy weapons program investigating lethality levels of short pulse width lasers, a combined analytical/experimental program has been underway to predict large deformation response of conceptual ballistic missile designs to impulsive loading. Both unpressurized cyclindrical shell models have been anaylzed and tested. Such impulsively loaded structures exhibit large scale plastic deformation and local dynamic pulse buckling instability which subsequently influence the loaded surface collapse. Impulse loads were simulated using both lead spray and light initiated high explosive techniques. Finite element calculation using a modified form of the Hughes-Liu shell element verify several characteristics of the structural response observed in experiments. The role of the computational results in identifying lethal impulse levels and response modes is described. In addition, the requirements for initial imperfections and fine mesh discretization for these problems are discussed.

37631 **(SAND—88-0394) Dependence effects in unique signal transmission.** Cooper, J.A. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 27p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010331/JAW.

"Unique Signals" are communicated from a source to a "strong link" safety device in a weapon by means of one or more digital communication channels. The probability that the expected unique signal pattern could be generated accidentally (e.g., due to an abnormal environment) would be an important measure. A probabilistic assessment of this likelihood is deceptive, because it depends on characteristics of the other traffic on the communication channel. One such characteristic that is frequently neglected in analysis is dependence. This report gives a mathematical model for dependence; cites some of the ways in which dependence can increase the likelihood of inadvertent unique signal pattern generation; and suggests that communicating each unique signal "event" at the highest level of protocol in the communication system minimizes dependence effects. 3 refs., 4 figs.

37632 **(UCRL—53784) Guidelines for evaluating the containment of underground nuclear detonations.** Olsen, C.W. (Lawrence Livermore National Lab., CA (USA)). Mar 1987. Contract W-7405-ENG-48. 22p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009030/JAW.

Evaluating the containment aspects of an underground nuclear test is a complex, multidisciplinary task. Many factors, manmade and natural, must be considered along with their various interactions. This document lists the factors that should be considered for a complete containment evaluation. It is intended as a guide for the newcomer, a resource for the experienced, and a reminder that we are most often working with imperfect knowledge.

37633 **(UCRL—98429) Designing tomorrow's warheads – today.** Schneider, D.P. (Lawrence Livermore National Lab., CA (USA)). 15 Mar 1988. Contract W-7405-ENG-48. 16p. (CONF-8806110—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008891/JAW.

From Army science conference; West Point, NY, USA (21 Jun 1988).

Until recently, new weapons' warheads were most often an incremental improvement on a previous warhead design. The tools available to the munition designer today, however, allow for a more comprehensive methodology to be employed. The focus of this paper will be a portion of the process of design of an explosively formed projectile (EFP) which uses tantalum as its liner material. Several questions surrounding tantalum's behavior under high strains require answers before such an EFP can be properly designed. The base-technology issues of different material properties will be explored using a three-dimensional finite element code (DYNA3D) and then compared to experiments. State-of-the-art diagnostics are an integral part of this methodology. Predetermined "flasher block" contours will provide specific position/time data which will assist in improving and understanding the high explosive equation of state as well as determining the energy imparted to the liner. In turn, this will lead to improved modeling of the liner as it translates along the line of flight. Flash X-ray Radiograph (FXR) will provide clues to axial symmetry, density, and overall time/distance information. This data will also provide answers to the strain rate depencence of the tantalum. Integration of the data from the experiment with the material response models allows post-experiment normalization of the code. This "normalized" tool is, finally used in the point design of the warhead.

4503 Explosion Detection

37634 **(UCID—21151-Rev.1) Delamar-induced ground motions at the Hardin site.** Hudson, B.; Stubbs, T.; Wheeler, V. (Lawrence Livermore National Lab., CA (USA)). 5 Aug 1987. Contract W-7405-ENG-48. 20p. NTIS, PC A03;3. Order Number DE88009244/JAW.

A satellite hole was drilled near the HARDIN site for the purpose of making hydrodynamics-yield measurements in support of the Treaty Verification Program. The satellite hole was also instrumented for monitoring ground motion from HARDIN. Because there was considerable interest in ground motion at the Hardin site induced by DELAMAR, the HARDIN instrumentation and recording system was activated during the DELAMAR event. This report presents those results. The relationship between DELAMAR and HARDIN is shown in Figures 1 and 2 and in Table 1. The locations of gauges in the HARDIN satellite hole are shown in Figure 3. Table 2 summarizes the peak measured values for ground motion at the HARDIN satellite hole due to DELAMAR, while individual data records are presented in Figures 4-18. Table 2 also includes predicted range of ground motion values. As indicated, the measured peak accelerations are somewhat below the predicted range, while measured peak velocities and displacements are within the predicted range. 18 figs., 2 tabs.

37635 **(UCRL—96747) Planar array bearing estimation performance bounds.** Harris, D.B. (Lawrence Livermore National Lab., CA (USA)). 30 Oct 1987. Contract W-7405-ENG-48. 5p. (CONF-871162—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011313/JAW.

From 21. annual Asilomar conference on signals, systems, and computers; Pacific Grove, CA, USA (2 Nov 1987).

The Weiss-Weinstein bound on bearing estimator mse is evaluated for planar arrays possessing near-circular symmetry and simpler triaxial single-station instruments. The bounds suggest superior bearing estimation performance of small-aperture seismic arrays when contrasted with the simpler instruments, particularly in the threshold SNR region. The results have implications for the composition of a seismic network that might be deployed to verify nuclear test ban treaties. 4 refs., 6 figs.

37636 **(LA-UR—88-1238) Update on the meso-microscale meteorological hierarchy.** Williams, M.D. (Los Alamos National Lab., NM (USA)). 1987. Contract W-7405-ENG-36. 19p. (CONF-8705282—1). NTIS, PC A03;3. Order Number DE88009133/JAW.

From Workshop on mesoscale modelling, turbulence and diffusion; Riso, Denmark (12 May 1987).

SIGTRA is designed to define the height of the material layer and provide interpolated mass and energy fluxes to VARYME. It also provides interpolated winds, temperatures, and potential densities at levels within the material layer. VARTRA uses similarity theory surface energy budget considerations, and the VARYME solutions to perturb the SIGMET profiles. It is the principal vehicle for converting the VARYME solutions into wind and temperature profiles and for incorporating the effects of local heating into the SIGMET solutions. VARTRA also is used to provide input to HRWHER. A number of shortcomings were identified after the early simulations of project WIND measurements in the Sacramento Valley of California. In particular, the surface temperatures were quite different from the measurements and the VARYME solutions were playing a very limited role in the perturbation of the SIGMET solutions. This note describes some of the efforts to cure these problems and the new simulations. The specific case represents the period June 27-28, 1985. The simulations began at 1pm Pacific Standard Time. Results are presented for 3pm on the 27th and 1am and 9am on the 28th. The SIGMET domain is 480 kilometers on a side of which a large portion is apron. Figure 1 reports the terrain of the SIGMET grid. The actual terrain without the apron is shown in Figure 2. 10 refs., 22 figs.

37637 **(LA-UR—88-1328) A radar study of the interaction between lightning and precipitation.** Holden, D.N.; Ulbrich, C.W. (Los Alamos National Lab., NM (USA); Clemson Univ., SC (USA). Dept. of Physics and Astronomy). 1988. Contract W-7405-ENG-48. 10p. (CONF-8806113—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009120/JAW.

From 8. international conference on atmospheric electricity; Uppsala, Sweden (13 Jun 1988).

A radar study was made of the interaction between lightning and precipitation with the 430 MHz Doppler radar at the Arecibo Observatory in Puerto Rico. On one occasion, the spectral power at Doppler velocities near that corresponding to the updraft increased substantially within a fraction of a second after a discharge was detected in the beam. Calculations were made to simulate the effect of an electric field change on mean Doppler velocity for a distribution of droplets in a thunderstorm. 13 refs., 4 figs.

37638 **(PNL-SA—15289) Sensitivity studies from two scavenging models.** Berkowitz, C.M.; Luecken, D.J. (Pacific Northwest Lab., Richland, WA (USA)). Aug 1987. Contract AC06-76RL01830. 14p. (CONF-8708238—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008187/JAW.

From ACID-MODES workshop; Raleigh, NC, USA (4 Aug 1987).

Results from sensitivity studies from two wet deposition models will be presented. One model (the RSM) has been designed for inclusion in the Regional Acid Deposition Model (RADM). The RSM can easily simulate a variety of meteorological and initial chemical conditions, and is therefore suited for a number of sensitivity studies. It has this flexibility as a result of the steady-state assumptions associated with its meteorology. The other model makes use of processor simulations defining detailed, time-dependent cloud simulations, which are then used to drive a version of the PLUVIUS series reactive scavenging model, which incorporates wet removal and aqueous chemistry. The latter approach is less suitable for meteorological sensitivity studies, because of the need to reinitialize the preprocessor simulations. Both models are designed to stimulate aerosol and gas scavenging processes and aqueous chemical reactions within individual storm systems. These models operate on horizontal scales of about 100 {times} 100 km, rather than the 1000-km scales associated with long-range transport or regional-scale air chemistry models. 9 refs., 16 figs.

37639 **(RISO-M—2627) Some properties of the Langevin model for dispersion.** Baas, A.F. de. (Risoe National Lab., Roskilde (Denmark)). Jan 1988. 248p. NTIS (US Sales Only), PC A11/MF A01 . Order Number DE88752925/JAW.

The Langevin equation is used to describe dispersion of pollutants in the atmosphere. The theoretical background for the equation is discussed in length and a review on previous treatments and applications i given. It is shown that the Langevin equation can describe dispersion in complex circumstances. In particular the equation is applied to dispersion in a convective boundary layer, where it reproduced the measurements accurately. Two froms of the Langevin equation, which have both been used in practical applications, are compared and it is concluded that in terms of their theoretical properties, they are not very different in spite of important differences in practical application. 142 refs.

37647 **(RISO-R—548) Puff kinematics.** Kristensen, L.; Kirkegaard, P. (Risoe National Lab., Roskilde (Denmark)). Nov 1987. 86p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752935/JAW.

We have developed a model to predict the growth of a puff in a turbulent fluid. We discuss in some detail basic considerations that lead to a gennerally accepted growth rate equation which requires knowledge of the autocovariance of the puff center velocity to be used. This autocovariance is modelled by an assumption which is similar to Corrsin's (1964) 'independence hypothesis'. We show that our system of equations has only one unknown function, viz. the Eulerian space-time velocity autocovariance, and that it can be solved if we assume that the turbulence is isotropic. The solution differs from that suggested by Mikkelsen et al. (1987) in that the puff growth rate predicted by our model is considerably smaller. We also compare our 'eddy lifetime' with the 'coherence destroying diffusion time' by Comte-Bellot and Corrsin (1970) and conclude that we are compelled by first principles to use the first and not the last of these characterisic time scales in our modelling of a Eulerian single-point autocovariance function and the Lagrangian autocovariance function shows that our model predicts that the first is never less than the last, a result which is in agreement with Kraichnan's (1964) considerations. 21 refs.

37648 **(UCRL—21043) FEM3A: A finite element model for the simulation of gas transport and dispersion: User's manual.** Chan, S.T. (Lawrence Livermore National Lab., CA (USA)). Apr 1988. Contract W-7405-ENG-48. 135p. NTIS, PC E07/MF A01; 1; GPO Dep. Order Number DE88011316/JAW.

Includes 1 sheet of 48x reduction microfiche.

FEM3A is a numerical model that has been developed primarily to simulate the atmospheric dispersion of heavier-than-air gas and liquid releases, using large scientific computers such as a CRAY-1. The model employs a modified Galerkin finite element method to solve the time-dependent conservation equations of mass, momentum, energy, and species of the dispersed material, together with the ideal gas law for the density of the mixture. A generalized anelastic approximation is invoked to preclude sound waves and yet allow large density variations in space and time. Turbulence is parameterized via a K-theory submodel and heat transfer between the ground surface and the vapor cloud is also included. The model can solve both two-dimensional and three-dimensional problems, including treatment of variable terrain and obstructions. It will handle instantaneous sources, finite-duration, and continuous releases. A simple phase-change submodel based on local thermodynamic equilibrium is available for handling the phase transition between vapor and liquid. Over the past six years, the model has been evaluated using a wide range of data obtained from both laboratory-scale and field-scale heavy-gas dispersion experiments. In this report, an overview of the model is given, the theoretical and numerical aspects of the model are briefly described, user's guides for using the model are provided, and three example problems are presented to illustrate the use of the model. 25 refs., 18 figs.

37649 **Comparisons of meteorological structure parameters in complex terrain using optical and acoustical techniques.** Porch, W.M.; Neff, W.D.; King, C.W. (Los Alamos National Laboratory, Earth & Space Sciences Division, Los Alamos, New Mexico 87545). *Applied Optics;* 27: No. 11, 2222-2228(1 Jun 1988).

Remotely sensed wind, temperature changes with height, and turbulence have been compared with in situ instrumentation using optical and acoustic techniques across and within valleys. These comparisons have provided data useful in the interpretation of spatial averages inherent in remote sensing with spatial and temporal representativity of point meteorological measurements in complex terrain. Of particular interest in this study was comparison of the optical turbulence derived index-of-refraction structure function C/sub n/ with the acoustically derived temperature structure function C/sub T/ over divergent scales across and within a valley.

37650 **Analytic spectral functions for atmospheric transmittance calculations.** Green, A.E.S.; Wagner, J.C.; Mann, A. (University of Florida, Gainesville, Florida 32611). *Applied Optics;* 27: No. 11, 2266-2272(1 Jun 1988).

Analytic formulas for the transition energies, intensities, and spectral absorption coefficients of the big (most intense) band systems of H_2O and CO_2 are presented. Analytic spectral representations of the Chappuis band of O_3, three bands of O_3, and two bands of CH_4 are also given. These inputs in conjunction with band model transmission formulas can be used with spectral functions for the extraterrestrial solar irradiance and Rayleigh and aerosol attenuation for engineering-type calculations of the direct solar spectral irradiance reaching the ground between 0.35 and 4.5 μm. Several algorithms may then be used for estimating the diffuse irradiance.

37651 **(AD-A—190419/2/XAB) Volatility of aerosols in the western European environment. Interim report No. 1 thru 3.** Jennings, S.G. (University Coll., Galway (Ireland)). Oct 1987. 7p. NTIS, PC A02/MF A01.

The volatility apparatus to be used in the proposed work is being currently assembled at the Atmospheric Sciences Laboratory, White Sands Missile Range, New Mexico. When the volatility apparatus is constructed and tested it will be shipped to University College Galway. It is then planned to carry out field-volatility

measurements of the ambient aerosol, primarily for the unmodified maritime air mass and secondly for the partially modified European continental air mass. Continuous measurements for periods up to some weeks spanning all four seasons are planned. In preparation for these measurements, a digital readout facility was acquired for the IM 146 velocity and direction transmitter to be used for recording wind speed and direction. The measurement system was electronically processed to facilitate continuous recording on a microcomputer.

37652 **(ANL/EES-TM—345-Vol.2) In pursuit of clean air: A data book of problems and strategies at the state level, 1987 update: Volume 2, Federal regions VI through X.** Loughe, A. F.; Gerry, P. A.; Streets, D. G. (Argonne National Lab., IL (USA)). Dec 1987. Contract W-31109-ENG-38. 308p. NTIS, PC A14/MF A01;1; GPO Dep. Order Number DE88011590/JAW.

This document is the third edition of a report that presents attainment strategies and maps of nonattainment areas throughout the contiguous United States. It contains nonattainment data that are accurate through December 31, 1987. The report presents, by state, tables of nonattainment and maps of areas in nonattainment of standards for total suspended particulates, sulfur dioxide, carbon monoxide, ozone, or nitrogen oxide. A summary of the State Implementation Plans (SIPs), a list of Prevention of Significant Deterioration (PSD) areas, a map of PSD Class I areas, a table of general sulfur dioxide and particulate matter emission limits, and a list of specific power plant emission limits are also presented. 13 refs., 11 tabs.

37653 **(BDX—613-3919) Annual site environmental report for calendar year 1987.** Brown, D.E. (Allied-Signal Aerospace Co., Kansas City, MO (USA). Kansas City Div.). Apr 1988. Contract AC04-76DP00613. 131p. NTIS, PC A07;3. Order Number DE88009364/JAW.

Air, land, and water quality in the Kansas City Plant environment were monitored and results are reported for calendar year 1987. Environmental monitoring for significant non-radioactive pollutants was conducted to allow evaluation of effluent effects on the environs of the federal complex. Monitoring for radioactive pollutants was not conducted because no processes exist that have a radioactive effluent to the environment. The non-radioactive monitoring data were compared to appropriate standards and guidelines. Results of ambient air and surface water analyses are well below standards and demonstrated no discernible adverse effects on air and water quality from plant discharges. On-site ground water monitoring, initially conducted in CY1984, continued in 1987.

37654 **(BNL—40755) Sulfur dioxide-hydrogen peroxide relationships in clean air, clouds, and precipitation.** Schwartz, S.E.; Daum, P.H. (Brookhaven National Lab., Upton, NY (USA)). Jan 1988. Contract AC02-76CH00016. 12p. (CONF-880604—4). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88006352/JAW.

From Joint meeting of the 195th national meeting of the American Chemical Society and the 3rd Chemical Congress of North America; Toronto, Canada (5 Jun 1988).

In-cloud oxidation by H_2O_2 is a major route for conversion of atmospheric SO_2 to sulfate, as indicated by kinetic calculations for representative H_2O_2 concentrations and supported by the observation of mutual exclusivity of gaseous SO_2 and aqueous H_2O_2 in non-precipitating liquid-water stratiform clouds, which generally persist sufficiently for reaction to proceed to completion. Measurements reported here indicate the aqueous S(IV) and H_2O_2 are also mutually exclusive in surface precipitation samples, but that SO_2 and aqueous H_2O_2 often coexist in precipitating clouds. Gaseous SO_2 and H_2O_2 are also commonly simultaneously present in clear air; in the mixed layer either species maybe in excess, but H_2O_2 present with SO_2 in precipitating clouds is attributed to material dissolved in falling hydrometeors which has not had time to react with SO_2. This supported by model calculations evaluating the characteristic time and distance for reaction of aqueous H_2O_2 in droplets falling through an SO_2-containing layer. 29 refs., 6 figs.

37655 **(CONF-880348—5) Microwave plasma dissociation of hydrogen sulfide.** Harkness, J.B.L.; Gorski, A.J.; Daniels, E.J. (Argonne National Lab., IL (USA)). Jan 1988. Contract W-31109-ENG-38. 12p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010086/JAW.

From American Institute of Chemical Engineers spring national meeting; New Orleans, LA, USA (6 Mar 1988).

The Claus technology and its associated tail gas cleanup (SCOT unit) for hydrogen sulfide environmental control recovers the sulfur contained in hydrogen sulfide wastes but loses the hydrogen as water. The alternative treatment process proposed in this paper uses plasma dissociation to recover the hydrogen in addition to the sulfur, thereby saving a significant fraction of the lost energy. The plasma process also appears to be more economical than the Claus/SCOT process. The total capital required for the plasma facility is projected to be $14 million, versus $26 million (including capital cost for the incremental hydrogen generation capacity) for the Calus/SCOT process. Because of energy savings, the annual operating costs for the plasma process are also lower than for the Claus/SCOT process. Assuming a 15% rate of return on capital, the plasma process will produce a net annual profit of $1.8 million relative to the Claus/SCOT. 4 refs., 6 figs., 3 tabs.

37656 **(CONF-8804140—1) Foliar nitrate reductase: A marker for assimilation of atmospheric nitrogen oxides.** Norby, R.J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 12p. (CONF-8804140—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010453/JAW.

From National Research Council workshop on biological markers of air pollution exposure in trees; Little Switzerland, NC, USA (25 Apr 1988).

Atmospheric deposition of nitrates to forest canopies has been implicated as predisposing trees to environmental stresses. A first step in the evaluation of this hypothesis is the determination of whether atmospheric nitrates are absorbed and metabolized by tree foliage. The enzyme nitrate reductase (NR) is an appropriate marker for nitrate metabolism because it is the rate-limiting step in the assimilation of nitrate into organic compounds and it is substrate-inducible. In laboratory studies, NR was not induced in red spruce foliage exposed to NO_3/sup {minus/} in acid mist, but NR activity increased dramatically in spruce seedlings exposed to NO_3 or HNO_3 vapor, suggesting that gaseous nitrogen oxides can be assimilated by spruce foliage. Nitrate reductase activity also can be measured in the field and may be a useful marker for trees that are impacted by nitrogen pollution, but extensive characterization of diurnal and seasonal variation in foliar NR activity is an important prerequisite. 24 refs.

37657 **(CRIE-U—87015) Effect of simulated acid rain on the growth and yield of soybean plants growth in pots.** Kono, Yoshihisa. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Sep 1987. 25p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752545/JAW.

Examination was made on the effect of simulated acid rain on the growth and yield of the soybean plants grown in pots. From the analysis of the rainfalls in Japan, the acid rain used was adjusted to the weight composition ratio of SO_4^{-2} to NO_3^- to CL^- of 2 : 1 : 1, and the four pH levels. The rainfall was 2.2 mm or 5.5 mm for 1 hr. every rain event. The frequency of the rain event was two times a week. The pH of the contrast was 5.6. At a pH of the rain below 4.0, visible symptoms were developed. The dry-weight per plant tended to be larger than that of the contrast at the pH of 4.0, and significantly smaller at the pH of 2.0. The dry seed yield per plant tended to be larger than that of the contrast at the pH of 2.0, and significantly smaller at the pH of 2.0. In this case, reductions in the number of the seeds per pad and in the number of the pads per plant were observed. The growing number of the root modules was larger than that of the contrast at the pH of 4.0 and significantly smaller at a pH below 3.0. (1 fig, 10 tabs, 29 refs)

37658 (DOE/MC/21063—2586) 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized bed gasification system. Quarterly report, October 1-December 31, 1985. (KRW Energy Systems, Inc., Madison, PA (USA)). Mar 1988. Contract AC21-84MC21063. 193p. NTIS, PC A09/MF A01; 1; GPO Dep. Order Number DE88001091/JAW.

The external hot gas cleanup system, designed for installation on the PDU at Waltz Mill, PA, consists of an external fixed bed desulfurizer of zinc ferrite sorbent, a tertiary particulate removal system (a sintered metal filter and venturi scrubber), and associated piping and instrumentation. The design report for this system was finalized. During the reporting period, PDU structural work was completed and the fixed bed desulfurizer was installed. Candidate samples of zinc ferrite sorbent were procured from United Catalysts, Inc. (2.89/lb) and from AMAX Extractive R & D, Inc. (4.80/lb). These sorbents will be pretested at the US Dept. of Energy Morgantown Energy Technology Center (DOE/METC) before they are tested in the desulfurizer at the PDU. In addition, purchase orders were released for a 5100 lb/hr steam supply system and for components to upgrade the PDU data acquisition system.

37659 (DOE/MC/21063—2587) 32-month gasifier mechanistic study and downstream unit process development program for the pressurized ash-agglomerating fluidized bed gasification system. Quarterly report, January 1-March 31, 1987. (KRW Energy Systems, Inc., Madison, PA (USA)). May 1988. Contract AC21-84MC21063. 95p. NTIS, PC A05/MF A01; 1; GPO Dep. Order Number DE88001092/JAW.

Technical progress and accomplishments achieved during external hot gas cleanup (HGCU) testing at the PDU were reviewed with representatives of the US Dept. of Energy Morgantown Energy Technology Center, and a 1987 Program Test Scope was finalized for continuation of PDU tests. The major modification for the next test includes reducing the inside diameter of the external desulfurizer from 4.5 to 2.0 feet which will decrease the bed volume to approximately 18 cubic feet. Thus, the time increment required to achieve sulfur breakthrough of the zinc ferrite desulfurizer bed should be less. Another modification removed the cold wall pipe as a gas cooling and deposit control device at the gasifier exit and added a direct water injection system to cool the product gas. In line with the new test scope, modifications were defined for future tests, such as: the option to test ceramic filter elements in the HGCU filter vessel and the addition of a building on the PDU that will house advanced instrumentation to monitor, record, and characterize the trace contaminants in the hot gas exiting the desulfurizer.

37660 (DOE/NBB—0084) Regional intercomparisons of General Circulation Model predictions and historical climate data: CO_2. Grotch, S.L. (Lawrence Livermore National Lab., CA (USA)). Apr 1988. Contract W-7405-ENG-48. 307p. NTIS, PC A14/MF A01;1; GPO Dep. Order Number DE88010416/JAW.

This study is a detailed intercomparsion of the results produced by four different General Circulation Models (GCMs) that have been used to project the climatic consequences of a doubling of the atmospheric CO_2 concentration. The results for the models developed by groups at the National Center for Atmospheric Research (NCARCCM, Washington and Meehl, 1984), the Geophysical Fluid Dynamics Laboratory of NOAA (GFDL, Manable and Wetherald, 1987), and the Goddard Institute for Space Studies of NASA (GISS, Hansen, et al., 1984) have been described by Schlesinger and Mitchell (1985) in the DOE state-of-art (SOA) report, "Projecting the Climatic Effects of Increasing Carbon Dioxide". The fourth model examined here is the Oregon State University GCM (OSU, Schlesinger, 1986), results for which did not become available until after publication of the SOA. We have chosen to examine only two model variables here: (1) surface air temperature, and (2) precipation. We consider these variables for both seasonally and annually averaged periods, for both the current climatic conditions and the predicted equilibrium changes after a doubling of the CO_2 concentration. The major conclusion of this study is that, although the models often agree well comparing seasonal or annual averages over the large areas, substanial disagreements become apparent as the spatial extent is reduced, particularly when detailed regional distributions are examined. At scales below continental, the correlations observed between different model predictions are often very poor, particularly for land gridpoints during the Northern Hemisphere (NH) summer, with differences of as much as 5{degree}C between models and observations and between one model and another over relatively large areas.

37661 (EPRI-CS—5850) Introduction to magnesium-enhanced lime flue gas desulfurization: Videotape workbook. (Electric Power Research Inst., Palo Alto, CA (USA); Radian Corp., Austin, TX (USA)). 1988. 28p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010694/JAW.

This workbook presents an introduction to the chemistry involved in a magnesium-enhanced lime FGD system. It covers the factors affecting the efficiency of magnesium-enhanced lime FGD system operation, emphasizing how an undestanding of the chemistry will help avoid some common problems. The ways in which ion activity and dissolved alkalinity affect sulfur dioxide removal, how relative saturations influence solids formation, and the importance of lime preparation all are explained. This tape is an introduction only; future tapes will cover lime/limestone FGD performance indicators and troubleshooting in more detail.

37662 (EUR—10563) Facts and uncertainties about acid rain a challenge for Europe. Benarie, M. (Commission of the European Communities, Luxembourg). 1986. 51p. Commission of the European Communities, Luxembourg.

This is a review of the topic acidic depositions. It points out the areas of well-established facts and other fields still open to debate and therefore requiring further research. Damages caused by acidic depositions are: - Loss in fish stocks. - Deterioration of stones and structural materials. Neither human health effects, nor crop losses can be clearly linked to acid rain. Acid deposition may be a co-factor of: - Forest damages in Central Europe. No prejudice could be established in Scandinavia. There are areas of future concern: - Soil acidification, and - Surface and ground water quality deterioration. The lack of reliable source-receptor relationships and the insufficiency of trend information does not allow firm opinions. These are other areas for future research. The probable money value of the losses is evaluated. The technical means to curtail emissions are available. Their application would represent about 10 per cent additional expense to the actual energy bills. Some actions of the Commission of the European Communities to safekeep the future and to promote research are discussed.

37663 (EUR—10646) Hydrocarbons Identification of air quality problems in Member States of the European Communities. Bouscaren, R.; Frank, R.; Veldt, C. (Commission of the European Communities, Luxembourg). 1986. 326p. Commission of the European Communities, Luxembourg.

Three European consultants, under contract by the Commission, have studied the problem tied to hydrocarbons in the atmosphere of the European Member States. For the first time, a very detailed emission inventory was made in each country (including Spain and Portugal). These emission inventories confirm that the two main producers of hydrocarbons are solvent consumption and road traffic (approximately 40 % each). A list of substances which are involved in this problem of air pollution (toxicity, chemical reactivity, etc.) has been established with their main characteristics. By enquiring in the Member States, information on the orders of magnitude of hydrocarbon concentrations (total non-methanic or sometimes single species) in the ambient air has been collected. These data show for some substances, and taking into account our present knowledge, the possibility of effects on human health or on ecosystems. Finally a review of the governmental actions already underway confirmed that, probably due to the difficulty of the problem, little coherent effort has been made from the legal point of view; however abatement techniques for hydrocarbon emissions do exist (for stationary sources as well as for mobile sources). But, because of the lack of serious assessments of the problems and of good plant designs, these techniques have often been considered as deceptive and inadequate.

37664 **(GAO/RCED—87-89) Acid rain: Delays and management changes in the federal research program.** (General Accounting Office, Washington, DC (USA)). 1987. 75p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The National Acid Precipitation Assessment Program is to help resolve the scientific uncertainties associated with acid rain and determine if and how it should be controlled. It has yet to issue its first assessment report originally scheduled for release in 1985. NAPAP officials believe that, by 1990, their ongoing research program will provide sufficient new information about the causes and effects of acid rain to serve as the basis for policy recommendations.

37665 **(IVL-B—778-Add.) New findings concerning reactions of airborne Hg in water solutions. Addendum to report IVL-B--778.** Brosset, C. (Swedish Environmental Research Inst., Goeteborg). 18 Mar 1987. 24p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752911/JAW.

It has been observed that airborne metallic Hg-vapour (Hg/sp0/) in the presence of O/sb3/ is oxidized when in contact with acid water solution. The oxidation product Hg/sp2+/ reacts further forming different complexes dependent on other components present in the water solution. When the same type of air as above is introduced into an alcaline water solution containing Hg/sp2+/, the last one will be reduced to Hg/sp0/ which leaves the liquid phase. This reaction does not take place if O/sb3/ is removed from the air, which occurs when the air flow is passing a gold trap before entering the solution. The agent responsible for both the oxidation and the reduction reaction is believed to be H/sb2/O/sb2/ formed from O/sb3/ and H/sb2/O or already present in the air.

37666 **(KFK-PEF—30) Development of a semi-continuous monitor to measure sulfuric acid and total sulfates in clean air regions.** Israel, G.W.; Boehm, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Europacisches Forschungszentrum fuer Massnahmen zur Luftre). Jun 1987. 23p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753374/JAW.

An instrument was developed that allows the separate and semi-continuous monitoring of ambient sulfuric acid and sulfates. The sulfate concentration is measured continuously with a flame photometric detector. The sulfuric acid is first absorbed and accumulated in a thermodiffusion denuder and subsequently analysed by the same detector. With a time resolution of 30 min. the detection limit of the instrument amounts to 1.0 μmm^3 for sulfate and 0.1 μgm^3 for the sulfuric acid. The automated and micro-computer controlled instrument is designed for use in forests. With 8 figs., 16 refs..

37667 **(LBL—24219) Removal of NO/sub x/ and SO_2 from flue gas using oxidizing compounds.** Littlejohn, D.; Chang, S.G. (Lawrence Berkeley Lab., CA (USA)). Jun 1988. Contract AC03-76SF00098. 23p. (CONF-880604—12). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011958/JAW.

From Joint meeting of the 195th national meeting of the American Chemical Society and the 3rd Chemical Congress of North America; Toronto, Canada (5 Jun 1988).

There are several general methods of NO/sub x/ and SO_2 from flue gas using chemical reactions. The pollutants can be oxidized, reduced, complexed or dissolved. Oxidation of NO/sub x/ and SO_2 will ultimately yieid nitrate (NO_3^-) and sulfate (SO_4^{2-}) when in solution. Reduction will lead to N_2 and elemental sulfur. Complexation has generally been applied to NO/sub x/ to generate nitrosyl complexes. Since NO/sub x/ is not highly soluble in aqueous solution, dissolution has been generally applied to SO_2 to generate HSO_3^- and SO_3^{2-}. It is desirable to develop a single process which acts on both SO_2 and NO/sub x/ to minimize the complexity of the scrubbing system for the power plant. A suitable oxidizing or reducing system could meet this criterion. The authors have investigated several peroxy compounds to determine their usefulness in removing NO/sub x/ and SO_2 from flue gas by oxidation.

37668 **(LBL—24891) Real-time measurements of the size fractionation of ambient black carbon aerosols at elevated humidities.** Hansen, A.D.A.; Novakov, T. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 12p. (CONF-871055—7). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010870/JAW.

From 3. international conference on carbonaceous particles in the atmosphere; Berkeley, CA, USA (5 Oct 1987).

The aethalometer is an instrument that responds to the concentration of aerosol black carbon in real time. Recent versions constructed at Lawerence Berkeley Laboratory (LBL) contain two or three channels that may be operated simultaneously. When preceded by size-segregating inlets of differing cut points, this configuration allows for a real-time determination of the size fractionation of the black carbon component of the aerosol. In field measuremens at LBL, we studied the incorporation of black carbon into marine fog droplets by comparing the total concentration with the "interstitial aerosol" concentration measured downstream of an interception mesh of 1-μm cutpoint. The data show that up to 80% of the carbon may be occluded by dropplets. In separate experiments during SCAQS program in southern California, a three-channel instrument, equipped with impactors, measured total, <1 μm, and <0.03 μm concentrations, and showed duirnal variations of size fractionation of the ambient carnonaceous aerosol. These results imply that a significant fraction of the aerosol black carbon particles may exhibit hygroscopic behavior. 6 refs., 3 figs.

37669 **(LBL—24892) A concurrent-flow cloud chamber study of incorporation of black carbon into droplets.** Benner, W.H.; Hansen, A.D.A.; Novakov, T. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 18p. (CONF-871055—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010858/JAW.

From 3. international conference on carbonaceous particles in the atmosphere; Berkeley, CA, USA (5 Oct 1987).

A concurrent-flow cloud chamber (16 cm i.d., 1.5 m high) is described in which cold particle-free and humidified particle-laden air streams were mixed to condense water droplets onto combustion-generated soot particles. Total and interstitial black carbon (BC) concentrations in the cloud were measured as a function of input black carbon concentration and the sample air stream dew point in real time, using a two-channel aethalometer. For black carbon particles produced by the combustion of propane, as much as 90% (by mass) of the black carbon when [BC] < 5 $\mu g/m^3$ was incorporated; this decreased to {approxiametly}20% when [BC] $>$ 20 $\mu g/m^3$. It was observed that as sample dew point passed through a maximum, simultaneous maxima were observed in the fraction of black carbon incorporated into droplets and in the amount of black carbon associated with large droplets that settled out of the air stream. The effective supersaturation in the chamber is a function of particle concentration. For black carbon particle concentrations above {approximately}20 $\mu g/m^3$, the estimated supersaturation is of the order of several percent for the experimental conmditions used. 10 refs., 6 figs.

37670 **(LBL—25034) Real-time measurement of aerosol black carbon during the carbonaceous species methods comparison study.** Hansen, A.D.A.; Novakov, T. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 15p. (CONF-871055—1; CONF-871055—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010779/JAW.

From 3. international conference on carbonaceous particles in the atmosphere; Berkeley, CA, USA (5 Oct 1987).

During the Carbonaceous Species Methods Comparison Study, we used the aethalometer, an instrument developed at LBL that measures the concentration of aerosol black carbon ([BC]) in real time. Measurements were taken from August 12-21, 1986, with a 1-min time base and grouped to show 1-hr and multihour concentrations. We found concentrations generally ranging from 1 to 10 $\mu g[BC]m^3$, usually increasing in the morning hours. We also observed short-duration (2--15 min) peaks in the black carbon concentration that could be directly attributed to the activity of vehicles in a delivery area less than 50m from the study site. We conclude that mobile sources were the major contributor to the short- and

medium-term variability of aerosol black carbon measured at this site. 7 refs., 4 figs.

37671 **(MST-LUFT-A—118) SO2-air quality evaluation by means of OML model for Esjberg, Odense and Aalborg.** Loefstroem, P.; Gislason, K.B.; Berkowicz, R. (Miljoestyrelsen, Roskilde (Denmark). Luftforureningslab.). Nov 1987. 87p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753329/JAW.

The Danish National Agency of Environmental Protection has in collaboration with local and regional authorities conducted a nationwide Air Quality Evaluation Program (abbreviated to LMP in Danish) for seven Danish cities. These are Copenhagen, Naestved, Odense, Fredericia, Randers, Esbjerg and Aalborg, with populations ranging from 30,000 to 1.000,000. The purpose of the program was fourfold: To gain knowledge on air quality in selected Danish cities, to test meteorological air quality models, to monitor the development of the air quality, and to form the initial basis for a mapping of the air quality in Denmark. In each of the seven cities several monitors were set up to measure SO2 (and other gases). Further, a mapping was undertaken of SO2-emissions from larger Point Sources, and from smaller sources grouped together in Area Sources (500 x 500 m2). The emissions from this mapping have been used in model calculations for the cities. The OML-model, which is a Gaussian model developed at the Danish Air Pollution Laboratory of the Danish EPA, was applied. Calculations were performed for every hour over a two-year period. Mean values and percentiles of SO2- concentrations were determined. Calculations of SO2-concentrations for Esbjerg, Odense and Aalborg are presented. A major result is that in all cities a few "large" sources (i.e. either source with large emission or sources where the plume is under influence of the wake from surrounding buildings) dominate the SO2-levels for short time periods. Small and large sources are important for long time periods. On the applied scale of resolution (250 m) the calculations show that the levels of SO2-concentrations and their geographical distribution do not vary considerably from one year to another. 20 refs.

37672 **(MST-LUFT-A—119) SO2-air quality evaluation by means of OML model for Randers, Fredericia and Naestved.** Loefstroem, P.; Stenfalk, L.; Berkowicz, R. (Miljoestyrelsen, Roskilde (Denmark). Luftforureningslab.). Nov 1987. 77p. (In Danish). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753330/JAW.

The Danish National Agency of Environmental Protection has in collaboration with local and regional authorities conducted a nationwide Air Quality Evaluation Program (abbreviated to LMP in Danish) for seven Danish cities. These are Copenhagen, Naestved, Odense, Fredericia, Randers, Esbjerg and Aalborg, with populations ranging from 30,000 to 1.000,000. The purpose of the program was fourfold: To gain knowledge on the air quality in selected Danish cities, to test meteorological air quality models, to monitor the development of the air quality, and to form the initial basis for a mapping of air quality in Denmark. In each of the seven cities several monitors were set up to measure SO2 (and other gases). Further, a mapping was undertaken of SO2-emissions from larger Point Sources, and from smaller sourses grouped together in Area Sources (500 x 500 m2). The emissions from this mapping have been used in model calculations for the cities. The OML-model, which is a Gaussian model developed at the Danish Air Pollution Laboratory of the Danish EPA, was applied. Calculations were performed for every hour over a two-year period. Mean values and percentiles of SO2-concentrations were determined. Calculations of SO2-concentrations for Randers, Fredericia and Naestved are presented. A major result is that in all cities a few "large" sources (i.e. either source with large emission or sources where the plume is under influence of the wake from surrounding buildings) dominate the SO2-levels for short time periods. Small and large sources are important for long time periods. On the applied scale of resolution (250 M) the calculations show that the levels of SO2-concentrations and their geographical distribution do not vary considerably from one year to another. 13 refs.

37673 **(MST-LUFT-A—120) Summary of the essential results in a national air quality measuring program.** Palmgren Jensen, F. (Miljoestyrelsen, Roskilde (Denmark). Luftforureningslab.). Oct 1987. 28p. (In Danish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752914/JAW.

The Danish Air Quality Monitoring Programme has been carried out in the period 1980-86 as a cooperation between the National Agency of Environmental Protection, the Greater Copenhagen Council, counties and municipalities in 7 urban areas. The monitoring includes SO2, and TSP (total suspended particulates) measurements at 30 locations. In addition, detailed emission inventories and meteorological air quality model calculations were performed for SO2. The following main conclusions about the air quality in Danish urban areas could be made: 1) Measured and calculated concentrations of SO2 in the 6 provincial towns showed no exceedings of limit values. Also the measured concentrations of SO2 in Copenhagen showed no exceedings of limit values. 2) In the provincial towns the model calculations showed exceedings of guide values of 99-percentiles of 1 hour average around single sources. 5) Annual averages of SO2 in the provincial towns were typically determined of all point sources. Building effects gave locally high values. Area sources did only contribute a little to the annual averages. Long-range transport did only contribute a little to the annual averages (6-9 mug/m3). (EG).

37674 **(NILU-OR—22/87) Oxidant data collection in OECD-Europe 1985-1987 (oxidate). Report on ozone, nitrogen dioxide and peroxyacetyl nitrate, April-September 1985.** Grennfelt, P.; Saltbones, J.; Schjoldager, J. (Norsk Inst. for Luftforskning, Lillestroem). Apr 1987. 103p. NTIS (US Sales Only), PC A06. Order Number DE88752843/JAW.

The report deals with a joint project of European OECD countries for the collection and distribution of regional data on ozone, nitrogen dioxide, and peroxyacetyl nitrate (PAN). The individual countries have selected a number of 25 monitoring stations, and they have been responsible for the quality assurance of the data. There has been no centrally organized intercalibration or other data control activity. The measuring methods used are chemiluminescence or UV absorption for ozone, chemiluminescence for nitrogen dioxide, and gas chromatography with electron capture detection for PAN. Ozone was reported from 24 stations, nitrogen dioxide from six, and PAN from one station. The ozone data have indicated a gradient in episodic high consentrations with lower levels in the north-western part, and higher levels towards the central and south-eastern part of Europe. It is not clear whether this is a general result or representative for 1985 only. There is a need to include more countries and monitoring stations in the project in order to improve the understanding of the oxidant phenomenon. 15 drawings, 10 tables.

37675 **(NILU-OR—45/85) Environmental impact of methanol as motor vehicle fuel.** Wathne, B.M.; Hov, Oe. (Norsk Inst. for Luftforskning, Lillestroem). Sep 1985. 117p. NTIS (US Sales Only), PC A06. Order Number DE88752844/JAW.

Methanol and gasoline/methanol blends are possible automobile fuels. Aldehyde and unburned methanol content in exhaust gases will increase with increasing use of methanol. NO(x) will decrease. Methanol can reduce the need for lead additives in gasoline. Formaldehyde is the dominant aldehyde in exhaust gases and in the atmosphere. Air quality standards, measured values and emission factors are listed. Health effects, atmospheric formation and degradation have been described. Calculations have been made which show that the addition of methanol to gasoline will result in slightly lowered photochemical activity. 166 refs., 30 figs., 24 tabs.

37676 **(ORNL—6441) Environmental Sciences Division annual progress report for period ending September 30, 1987.** (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 221p. NTIS, PC A10/MF A01;1; GPO Dep. Order Number DE88010764/JAW.

Environmental Sciences Division Publication No. 3092.

This progress report summarizes the research and development activities conducted in the Environmental Science Division of

Oak Ridge National Laboratory during the period October 1, 1986 through September 30, 1987. The report is structured to provide descriptions of current activities and accomplishments in each of the Division's major organizational units. Following the accounts of section activities and program activities is a section devoted to lists of information necessary to convey the scope of the work in the Division.

37677 **(PB—88-180393/XAB) Removal of volatile aliphatic hydrocarbons in a soil bioreactor.** Kampbell, D.H.; Wilson, J.T.; Read, H.W.; Stocksdale, T.T. (Environmental Protection Agency, Ada, OK (USA). Robert S. Kerr Environmental Research Lab.). 1987. 7p. (EPA—600/J-87/261). NTIS, PC A02/MF A01.

Pub. in International Jnl. of Air Pollution Control and Hazardous Waste Management, Vol. 37, No. 10, 1236-1240(Oct 1987).

Soil removal of propane, isobutane and n-butane from a waste air stream was evaluated in the laboratory and in a prototype soil bioreactor. Laboratory investigations indicated first-order kinetics and the potential to degrade light aliphatic hydrocarbons and trichlorethylene, a compound ordinarily resistant to aerobic biological treatment. The predicted behavior of the bioreactor, based on laboratory studies, agreed closely with the actual behavior of the field system. The prototype bioreactor reduced the hydrocarbon concentrations in the air by at least 90% with a residence time of 15 minutes and a pressure drop of 85 cm of water. The bioreactor functioned well through a range of temperatures, 12C to 24C.

37678 **(PB—88-181052/XAB) Model and data-base description for California's Level 1 PM(10) assessment package. Final report, 15 July 1985-30 April 1987.** Watson, J.G.; Chow, J.C.; Freeman, D.L.; Egami, R.T.; Roberts, P.T. (Nevada Univ., Reno (USA). Desert Research Inst.). Sep 1987. 170p. (DRI—8066-002.1F1). NTIS, PC A08/MF A01.

See also PB—88-181060.

A Level I PM(10) Assessment Package described will allow initial estimates to be made of the source contributions to PM(10) receptor concentrations. The package consists of the Principal Components Analysis, Chemical Mass Balance (CMB), and Industrial Source Complex-Short Term models implemented on IBM/PC compatible microcomputers. The software is applicable to existing data sets and is consistent with EPA's protocols for application and validation of the CMB receptor model and for reconciling differences among receptor and dispersion models. The document describes the models included in the Level I PM(10) Assessment Package, the measurement methods which are commonly applied to obtain model input data, and the availability of these data in the state of California. A companion users' manual provides step-by-step instructions on the application of the package to real data.

37679 **(PB—88-181060/XAB) Model and data-base description for California's Level 1 PM(10) assessment package: users' guide. Final report, 15 July 1985-30 April 1987.** Freeman, D.L.; Robinson, N.F.; Watson, J.G.; Chow, J.C.; Egami, R.T. (Nevada Univ., Reno (USA). Desert Research Inst.). Oct 1987. 125p. (DRI—8066.2F). NTIS, PC A06/MF A01.

37680 **(PB—88-181805/XAB) Implications of perception thresholds for soiling.** Bradow, F.V.; Lockheed, G.R.; Bradow, R.L. (Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Criteria and Assessment Office). Mar 1988. 25p. (EPA—600/D-88/044). NTIS, PC A03/MF A01.

Soiling of materials and visibility reduction are the two most-important welfare effects of particulate matter. Though the relationship between fine particles and visibility reduction is well documented, the evidence for the relationship of ambient particles to soiling is scant and poorly understood. Considerable uncertainty exists concerning the amount of surface-accumulated particulate matter that leads to a decision to clean, since not only are socio-economic factors involved in such a decision, but accumulation of the particles must first be perceived as soiling. Information regarding relevant physical and chemical properties of airborne particles are reviewed (e.g., factors affecting deposition velocity and color). Considerations to assure congruency between physical-measurement techniques and human observations are discussed. Factors are recommended for inclusion in development of psychophysical models to relate psychological and physical scales of soiling.

37681 **(PB—88-184429/XAB) CO_2-problems. Scientific insights and social consequences.** (Gezondheidsraad, The Hague (Netherlands)). 16 Dec 1986. 149p. (In Dutch). (R—32). NTIS, PC E06/MF A01.

The second report on the effects of increasing CO_2 concentration in the atmosphere was prepared by a committee of the Health Council of the Netherlands. The committee focused its considerations on the possible impacts on society. The increase of CO_2 concentration in the atmosphere is continuing at approximately a rate of 0.5% per year, notwithstanding the somewhat reduced rate of increase of fossil fuel consumption since 1980. The CO_2 increase itself is not directly harmful for human beings, but climate changes and other indirect consequences may seriously affect their wellbeing. The committee arrived at a number of conclusions: within 50 years from now expected changes call for measures to be taken in the field of coastal protection and water management; at longer time scales, climate changes and the CO_2 stimulating effect on plant growth call for measures in the field of agriculture, food supply and the management of natural ecosystems.

37682 **(PB—88-185640/XAB) Observations on studies useful to asbestos O and M activities. Technical paper.** Wilmoth, R.C.; Powers, T.J.; Millette, J.R. (Environmental Protection Agency, Cincinnati, OH (USA). Water Engineering Research Lab.). Mar 1988. 28p. NTIS, PC A03/MF A01.

Buildings that contain ACM (asbestos-containing-materials) may present unique problems for custodial workers. The release of asbestos by aging and deteriorated ACM is known to be episodic, relating to a myriad of factors such as activity within the area, vibration, temperature, humidity, airflow, use patterns, etc. Hopefully, for the majority of buildings containing ACM, fiber release is minimal. If a building contains asbestos and releases occur, the custodial worker may be most intensely affected over the long term. If a release occurs, much of the asbestos will eventually settle and attach to the surfaces of the rooms (walls, furnishings, equipment, floors, and carpet). The preliminary analysis of dusty environments is presented for the micro-vac, sonification, and passive-air-current sampling methodologies.

37683 **(PB—88-186317/XAB) Mesoscale modeling of acid deposition in Maryland. Final report.** Kumar, S. (Versar, Inc., Columbia, MD (USA)). Oct 1987. 167p. NTIS, PC A08/MF A01.

See also PB—88-157805 and PB—88-186309.

The MESOPUFF-II model was exercised to examine spatial and temporal patterns of wet acid deposition in Maryland due to major in-state sources. An entire year (1984) of meteorological data was used as input to the model. Isopleths of predicted monthly and annual wet deposition over Maryland are presented, based on a total of 111 receptors modeled including estimates of wet deposition for 11 monitoring sites in and around Maryland. Two source scenarios of interest were investigated, namely, major power plant

sources in Maryland and the Baltimore Metropolitan Area source. The results of modeling showed that for the case of elevated point sources, representing major Maryland power plants, wet deposition of primary species (SO_3) tends to occur locally around the sources, while wet deposition of secondary species (SO_4, NO_3, and HNO_3) peaks at distances of 75-100 km from the largest sources.

37684 **(PB—88-186655/XAB) Formaldehyde: a candidate toxic air contaminant. Final report.** Frye, B.; Parker, T. (California State Air Resources Board, Sacramento (USA)). Mar 1988. 14p. (ARB/SS—88/02). NTIS, PC A03/MF A01.

Formaldehyde (HCHO) is a gas widely used in adhesives and resins, textiles, embalming fluids, fungicides, air fresheners, and cosmetics. It is directly emitted into the ambient outdoor air from vehicular and stationary sources, and is also produced in the atmosphere from other substances by photochemical smog processes. The International Agency for Research on Cancer (IARC) has determined that there is sufficient evidence for carcinogenicity of formaldehyde to animals, and limited evidence for carcinogenicity to humans. EPA classifies formaldehyde as a probable human carcinogen with a one in a million risk concentration of 0.08 ppb.

37685 **(PB—88-186911/XAB) Facts and uncertainties about acid rain: a challenge for Europe. Final report.** Benarie, M. (Commission of the European Communities, Luxembourg). 1986. 58p. (EUR—10563-EN). NTIS, PC E04/MF E04.

Customers in the European Community countries should apply to the Office for Official Publications of the European Communities, B.P. 2985, Luxembourg.

The report reviews the topic acidic depositions. It points out the areas of well-establibhed facts and other fields still open to debate and therefore requiring further research. (1) Damages caused by acidic depositions are: Loss in fish stocks. Deterioration of stones and structural materials. Neither human health effects, nor crop losses can be clearly linked to acid rain. (2) Acid deposition may be a co-factor of: Forest damages in Central Europe. (3) There areas of future concern are: Soil acidification, and Surface and ground water quality deterioration. The probable money value of the losses is evaluated. The technical means to curtail emissions are available. Their application would represent about 10% additional expense to the actual energy bills. Some actions of the Commission of the European Communities to safekeep the future and to promote research are discussed.

37686 **(PB—88-190632/XAB) Formation and control of nitrogen-containing air pollutants. Final report, June 1983-April 1987.** Russell, A.G.; Cass, G.R. (California Inst. of Tech., Pasadena (USA). Environmental Quality Lab.). May 1987. 229p. (EQL—24). NTIS, PC A11/MF A01.

This work focuses on the formation, transport, and control of nitrogen-containing air pollutants. Particular attention is paid to the problem of understanding how to control atmospheric-aerosol nitrate and nitric acid concentrations. In the course of the study, additional insights are gained into the effects of emission controls on other co-pollutants, including NO_2, O_3, PAN and ammonia. Computer-based theoretical models are employed that relate emissions of reactive organic gases, oxides of nitrogen and ammonia to downwind pollutant concentrations. Both trajectory models that follow the path of a single air parcel and grid models that examine an entire air basin are used. The trajectory version of the atmospheric model is used extensively to test the new features of the chemical mechanism that is built into these models. Nighttime atmospheric chemical reactions that can lead to nitric acid formation are examined, and are found to produce significant amounts of HNO_3. The hypothesis that atmospheric HNO_3 and NH_3 are in equilibrium with the aerosol phase is tested, and found to be a useful basis for predicting the ambient HNO_3 and NH_3 levels.

37687 **(PB—88-191374/XAB) Parametric methodologies of cloud vertical transport for acid-deposition models.** Vukovich, F.M.; Haws, R.C. (Research Triangle Inst., Research Triangle Park, NC (USA)). Mar 1988. 309p. NTIS, PC A14/MF A01.

A CUmulus VENTing (CUVENT) cloud module has been developed that calculates the vertical flux of mass from the boundary layer to the cloud layer by an ensemble of nonprecipitating subgrid-scale air-mass clouds. This model will be integrated into the Regional Acid Deposition Model (RADM) and will serve to establish the effect of cloud venting for the RADM. In the initial phase of this research project, the basic cloud venting algorithm was established. CUVENT used the cloud model that was established by Ritter and Stedman (1985) to calculate the vertical transport of mass due to the ensemble of nonprecipitating air-mass convective clouds. The major effort of the first phase of this research project was to design an optimal parameterization scheme for the cloud model so that it may be incorporated in the RADM. This parameterization scheme used basic meteorological data such as pressure, temperature, humidity, surface heat flux, etc., to predict the convective cloud amount at cloud base and cloud distribution parameters. The various models that made up this scheme were developed using data obtained during the VENTEX field program.

37688 **(PB—88-193628/XAB) Theoretical studies of long-range transport of oxidants. Final report.** Sillman, S.; Jacob, D.J.; Logan, J.A.; Spivakovsky, C.M.; Yevich, R.M. (Harvard Univ., Cambridge, MA (USA)). 29 Dec 1987. 98p. NTIS, PC A05/MF A01.

See also report dated Mar 86, PB—86-232683.

The goal of the project was to develop a model with the capabilities of predicting ozone levels in rural areas. The focus was on long-term statistical measures of air quality. The effort was undertaken in concert with projects funded by NASA and NSF in which a large-scale 3-dimensional chemical tracer model (CTM) was developed for the purposes of studying global atmospheric processes. An ab initio general circulation model (GCM) provides the dynamical framework for the CTM. The CRC project was intended to bring the global model to the regional scale, allowing simulation of mechanisms for production of rural ozone in a realistic dynamical framework. The report details results from four studies which were used to rigorously test the concepts to be employed in the fully coupled CTM. It was shown that the concentrations of ozone precursors in rural air are sufficient to produce significant levels of photochemical oxidant in 1-3 days. Thus, under stagnation conditions, rural ozone levels will become elevated due to local photochemistry.

37689 **(PB—88-195177/XAB) Impact on ozone attainment of CFC (chlorofluorocarbon) controls used to prevent future depletion of stratospheric ozone.** Harmon, D.L.; Smith, N.D. (Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab.). Apr 1988. 19p. (EPA—600/D-88/074). NTIS, PC A03/MF A01.

This paper discusses the impact on ozone attainment of chlorofluorocarbon (CFC) controls used to prevent future depletion of stratospheric ozone. It has been decided that allocated quotas offer the most-attractive approach to limiting the use of CFCs and brominated compounds (halons). This approach should provide for economically efficient reductions. It involves a minimum of administrative costs, is the most easily enforced option, and does not raise any potential legal issues that might result from other options. Control options that might be used by industry to achieve the necessary CFC reductions are evaluated in the Regulatory Impact Analysis (RIA). The most likely long-term control option which may be adopted by most application areas is a chemical substitute. With this option, it may be possible to eliminate 90% or more of the ozone-depleting CFC emissions. A variety of control options hold promise for short-term applicability. Some of the engineering controls may still be applied even after new chemical substitutes (e.g., HFC-134a and HCFC-123) are in use, since the higher cost of these substitutes may justify recovery. EPA is also considering the development of specific regulations limiting CFC and halon use for particular industries to supplement allocated quotas.

37690 **(PNL—6461) The MAP3S network data and quality control summary for 1985.** Dana, M.T. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 84p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008463/JAW.

This report, the ninth in a series documenting results from the MAP3S Precipitation Chemistry Network, contains a statistical

summary of daily precipitation chemistry data from the nine-site network in the eastern United States, both for the year 1985 alone and for the period 1977 through 1985. In addition, a report on quality control and external quality assurance activities is included, which updates the 1980 quality control report.

37691 **(PNL-SA—15645) Statistical techniques for regional model evaluation.** Dana, M.T. (Pacific Northwest Lab., Richland, WA (USA)). Jan 1988. Contract AC06-76RL01830. 9p. (CONF-880388—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008206/JAW.

From NAPAP atmospheric chemistry task group II peer review; Oxford, OH, USA (16 Mar 1988).

Regional acidic deposition models, such as RADM, can generate both short-term and long-term average concentration and deposition fields for the chemistry of precipitation. Evaluation of these averages at sampling points has difficulties: low spatial grid resolution makes the test for short-term (e.g., precipitation event) averages too severe, while the predicted long-term (e.g., annual) averages can too easily approximate measurements without properly addressing mechanisms. These models, however, should be able to simulate concentration distributions at sampling points and reflect seasonal and spatial variations caused by physical and chemical processes included in the models. The availability of 10 years of regional event precipitation chemistry data makes it possible to produce robust distributions of observations for the modeling community's use in evaluation and further development. The project objectives are to calculate and characterize precipitation concentration distributions for sampling sites in the MAP3S network (eastern United States) region; and to evaluate the distributions in terms of spatial, seasonal, and chemical species variations, with the aim of simplifying the model evaluation process. 1 ref., 5 figs., 2 tabs.

37692 **(PNL-SA—15687) Large-eddy simulations of concentration fluctuations.** Bader, D.C.; Horst, T.W. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 4p. (CONF-880463—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009480/JAW.

From 8. symposium on turbulence and diffusion of the American Meterological Society; San Diego, CA, USA (1 Apr 1988).

This paper describes an initial effort to develop a model for numerical simulation of atmospheric diffusion that has spatial and temporal resolution adequate for the estimation of concentration fluctuation statistics. Our intention is to develop a research model whose output has the realism necessary for development and testing of simpler models and parameterizations of concentration fluctuation statistics, which can in turn be used to solve applied problems. This model is built on a large-eddy simulation (LES) model of the turbulent flow field and a time-dependent solution of a passive tracer conservation equation, with a turbulence closure that parallels the LES closure of the Navier-Stokes equations. The model is used to simulate the neutral boundary layer wind-tunnel experiments of Fackrell and Robbins (1982) and the results are evaluated against their measurements. It is believed that once the model can faithfully reproduce observed data, it can then be used as an experimental tool to produce realistic simulations of new and currently unobserved cases. 8 refs., 2 fis.

37693 **(PNL-SA—15689) Field-study design for module evaluation: PRECP VI/3CPO.** Hales, J.M. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 8p. (CONF-880351—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008183/JAW.

From NAPAP atmospheric chemistry task group review; Knoxville, TN, USA (13 Mar 1988).

PRECP VI is the sixth in a progressive series of scavenging field studies, and is centered on the analysis of scavenging by summertime convective storms in polluted environments. Such storms are of substantial interest to NAPAP because they account for a large fraction of the pollution that is wet-deposited annually in the eastern half of the country. Accordingly, convective-storm scavenging behavior must be understood quantitatively to evaluate issues such as nonlinearity and the effects of emission changes on wet deposition. The Regional Acid Deposition Model (RADM) contains a convective-storm scavenging module that has been developed as a component of the NAPAP program. Although this module has been designed to simulate actual scavenging phenomena as accurately as is possible within the constraints imposed by RADM's architecture, to date there has been no satisfactory evaluation of this module's performance in light of a comprehensive data set. One of the important roles of PRECP VI is the generation of a robust data base to be used for this purpose. 1 ref., 2 figs.

37694 **(PNL-SA—15768) Computer simulation procedure for designing airborne aerometric monitoring programs.** Hales, J.M.; Pennell, W.T. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 3p. (CONF-8805101—2). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011896/JAW.

From Conference on lower troposphere profiling: needs and technologies; Boulder, CO, USA (31 May 1988).

With the growing cost and sophistication of modern meteorological and air pollution field experiments, it is becoming increasingly necessary to improve the quality of the design phase of these programs. Experiment designers are faced with the difficult task of choosing, from an ever-expanding assortment of choices, the optimum mix of fixed and mobile, in situ- and remote-sensing devices needed to meet the measurement objectives of their programs. Choosing this optimum mix also requires the designer to determine how these sensing devices should be deployed - given some hypothesis about the spatial and temporal structure of the fields to be observed. The demands of this design process suggest the need for objective analysis tools that allow a designer to examine quantitatively the operational behavior of various measurements techniques and measurements platforms and to assess the effectiveness of alternative sampling strategies.

37695 **(PNL-SA—15880) Effect of the ASARCO smelter shutdown on the acidity of rainfall in the Puget sound area.** Laulainen, N.S.; Larson, T.V.; Vong, R.J.; Zoller, W.H. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 12p. (CONF-880595—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011898/JAW.

From NAPAP atmospheric transport and modeling research program review meeting; Richmond, VA, USA (1 May 1988).

The influence of the sulfur dioxide emissions from a large copper smelter in Tacoma, Washington, USA, was studied by measuring the chemical composition of rainwater collected upwind and downwind of the source, before and after permanent closure of the smelter in 1985. Data analysis was based on a statistical model that accounted for variability associated with location of 25 sampling sites within three geographic regions, smelter operation, ten individual rain events observed over 2 years, and measurement uncertainty. After smelter closure, the upwind-downwind differences in mean hydrogen ion and excess sulfate ion concentrations within a 600 km^2 region extending to 25 km downwind of the source had decreased significantly compared to the pre-closure value. No significant decreases in mean ion concentrations were observed farther downwind in the Seattle, urban area. During five events sampled prior to smelter closure, we estimate that an average of 1.7% (range 0.3 to 3.0%) of the sulfur dioxide emitted by the smelter was wet deposited as sulfate ion within a 3600 km^2 area extending 60 km downwind of the source.

37702 (STEV-FBT—87-39) **Reduction of NO in flue gases by adding NH_3.** Andersson, L. (Statens Energiverk, Stockholm (Sweden)). Oct 1987. 18p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752953/JAW.

A theoretical study has been made of the mechanism in order to provide a better understanding of this process for decreasing NO emission from combustion units. A number of programs have been developed for this project, in conjunction with other projects, including: a. Equilibrium program to describe the composition of the flue gas. b. Program for NO reduction by ammonia. c. Data base program to compute thermodynamic and kinetic data from data bases and mechanisms. From simulations of the influence of the conditions on the reduction of NO, a number of conclusions have been made. a. Reduction at optimum temperature is nearly independent of NO concentration. b. Leaner conditions give reduced removal of NO. c. Addition of water to flue gases reduces reduction. Fuels with high content of hydrogen also decrease reduction of NO due to production of water. d. A surplus of ammonia compared to NO improves NO removal for reasonable residence times. e. The residence time is of crucial importance to the reduction. An increased residence time gives marked improval in reduction. f. The temperature is also a critical parameter, with a narrow window centred on 1250 K giving optimum reduction. g. The combination of long residence time and a surplus of ammonia has the potential for nearly complete reduction. Global sensitivity analyses have been done using the 'brute force' method for all reactions. In conclusion, the molecular interpretation of the NO reduction by ammonia gives a consistent picture of the process with the experimental data over different conditions.

37703 (STEV-FBT—88-3) **Emissions from landfill deposition gas plants.** Hoejlund, A. (Statens Energiverk, Stockholm (Sweden); Miljoekorsulterna i Studsvik AB, Nykoeping (Sweden)). Dec 1987. 55p. (In Swedish). (MKS—87-100). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752955/JAW.

Measurements of gas fuels and flue gases from two plants for landfill deposition gases have been performed during September 1987. One of the plants has a gas boiler for hot water production and the measurement has been made at the stack. The second plant is made for drying purposes and the measurements have been performed in the surplus gas flame. The following components have been determined: chlorine,freons, polycyclic aromatic hydrocarbons, mercury, cadmium, lead, zinz, chlorine phenols and benzenes. The contents of pollutants were low when compared with refuse burning.(G.B.).

37704 (STEV-FBT—88-5) **Sulphur capture in a fluidized bed combustor. The effect of temperature.** Lyngfeldt, A. (Statens Energiverk, Stockholm (Sweden); Chalmers Univ. of Tech., Goeteborg (Sweden). Dept. of Energy Conversion). 1987. 79p. (CTH-IE-A—87-167). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752957/JAW.

The influence of temperature on the reaction of SO/sb2/ with lime is studied. It is found that the SO/sb2/ capture decreases markedly with temperature at temperatures above 860-880 degrees C. When temperature is increased to above 900 degrees C the degree of sulphur absorption decreases momentarily to zero or possibly even below zero. This result suggests that previously captured SO/sb2/ is released at high temperatures. The temperature dependence is also found to remain long after the lime addition was stopped (50 hours) and when the net sulphur absorption is approximately zero. Only one of the theories proposed in the literature on the temperature dependence of fluidized bed sulphur capture can fully explain the observations made in this study. According to this theory CaSO/sb4/ is reduced by CO at reducing conditions and at high temperatures. The continuous limestone addition to a bed initially consisting of silica sand resulted in a substitution of the bed material with CaSO/sb4/ and CaO. The lime accumulated in the bed is still active as a sorbent after a long time, i.e. one or two days, in the bed. (71 references, 39 figures)

37705 (SVF—245) **Emission and reduction of NOsub(x) in premixed natural gas-air flames.** Holmstedt, G. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Jan 1987. 27p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752979/JAW.

The object of this work was to study the suppression of NOsub(x) formation in premixed natural gas-air flames. The control techniques studied were: changes in the geometry (flame holder and length of combustion chamber), load reduction, air preheating, flue gas recirculation and fuel-air ratio. The experiments were performed with a square flame holder and an insulated square combustion chamber at a power of 35-50 kW. The flue gas was externally recirculated and the combustion air was electrically preheated. The emission of NOsub(x), CO, CO/sb2/ and HC was measured using cheminiluminescent (NOsub(x)), infra-red (CO, CO/sb2/, HC) and paramag netic (O/sb2/) analysers. The evaluation of the measurements showed that the emission of NOsub(x), CO and HC could be controlled in a short combustion chamber if flue gas recirculation was combined with preheated air.

37706 **(SVF—247) Evaluation of EMP dilution system for the measurement of emissions into air.** Hellen, G. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Jan 1987. 35p. (In Swedish). NTIS (US Sales Only), PC A03. Order Number DE88753342/JAW.

A sampling system based on the dilution probe technology (EPM, Environment and Process Monitoring, diluted stack sampler) has been studied from a theoretical and field experience point of view. The dilution probe technology may be generically defined as a sampling technique whereby a small continuous sample is filtered and diluted at stack temperature prior to conveyance to a set of analyzers. This is done with an instack venturi, in which preheated instrument air serves the triple function of extracting the sample, diluting it, and conveying it under pressure to the remote analyzers. The dilution probe sampling technology has provided a relatively easily installed, accurate alternative with lower maintenance costs to conventional sampling systems. Variation of the flue-gas pressure and temperature and differences in the reference- and flue-gas -densities will decrease the accuracy of the EPM dilution stack sampler. Laboratory evaluation shows that an increase (decrease) in the absolute flue-gas leads to a similar percentual increase (decrease) in the reading of the analyzer. A change in the flue-gas temperature by 10 degrees centigrade will lead to an analyzer reading error of 1 per cent. The reference-gas commonly being used has a density of 1.25 kg/m/sup3/ norm. The density of the flue-gas is usually 1.5 - 1.35 kg/m/sup3/ norm. Field experiences associated with the use of the EPM diluting stack sampler show no technical problems in applications to ducts with low dust loading (after the precipitator). (authors).

37707 **(SVF—262) Testing of reference gases, SO/sub2/ and NO.** Hellen, G. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). May 1987. 32p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752986/JAW.

Twenty SO/sub2/ and twentyone NO reference gases were collected from seventeen users of calibration standards. These standards contained sulphur dioxide in nitrogen (50-850 ppm) and nitric oxide in nitrogen (30-1000 ppm). The accuracies of the producers' certified concentrations were significantly better for nitric oxide cylinders than for those of sulphur dioxide. For both types of standards 95% of the producers' certified concentrations were accurate to within +- 15%. About 15% of the sulphur dioxide cylinders were accurate to within +- 2%. The corresponding number of nitric oxide cylinders were about 50%. In general the producers' certified concentrations were less accurate than obtained by USA/EPA in 1985/4/, but significantly more accurate than USA/EPA obtained in 1981/3/. No significant differences in accuracies were obtained as a result of assumed long-term instabilities.

37708 **(SVF—268) Fluid dynamic aspects of sorbent injection for SOsub(x) control, a prestudy.** Ljung, L. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Jun 1987. 31p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752988/JAW.

Sulphur can be removed from flue gases through direct in furnace injection of a suitable sorbent. Several conditions must be fulfilled in order to achieve an efficient desulphurization. This prestudy is however only concerned with the fluid dynamics aspects of sorbent injection. For efficient desulphurization it is of course necessary to get a good mixing of the sorbent particles with the flue gas. The hold up time of the particles should be long enough in a suitable temperature interval. For design of the sorbent injection system it is necessary to have a detailed knowledge of flow patterns, flue gas velocities and temperatures in the furnace. An extensive use of measurements and fluid flow modeling is thus required. Discussed in the report are different fluid dynamic aspects that are of importance, e.g. turbulence and particle inertia. In some cases numerical values for different entities with dimension time can be estimated and compared. An implication of that is the importance of using a sorbent with small enough particle size.

37709 **(SVF—274) Optimization of desulphurization by means of injecting limestone into the grate-fired furnace at Kalmar.** Aabom, J. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Aug 1987. 101p. (In Swedish). NTIS (US Sales Only), PC A06. Order Number DE88753346/JAW.

The investigations showed that a considerable reduction of the SO_2-content in the flue gases could be made by a special injection mechanism with injections of finely ground dolomite in the furnace. With a CaS-proportion of 1.67, 65% SO_2 was separated. The coal had a sulphur content of 0.55%. The tested injection-mechanism is especially suitable because of its capacity to separate the isolated particles and maintain this separation during transportation to the furnace. Through this, small-grained material with large specific surface can be exploited very efficiently. The emission of NO/sub x/ was significantly influenced by the dolomite injection. The dust emission was reduced in spite of the increased dust quantity that was fed to the electrostatic dust separators. Ordinary soot blowers kept the surfaces sufficiently clean during the tests. The total cost for equipment, energy and absorbent is about SEK 0.014 kWh with the above stated data for coal. The cost depends very much on the price for dolomite and the coals sulphur-content.

37710 **(SVF—278) Continuous measurements of SO/sb2/, NO, CO/sb2/ and flow velocity.** Nyquist, G.; Radoe, J.; Vesely, V. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden); National Swedish Environmental Protection Board, Solna). Sep 1987. 81p. (In Swedish). (SNV—3368). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88752989/JAW.

Simultaneous measurements of flow velocity and concentrations of SO/sb2/, NO and CO/sb2/ have been performed in a stack at the heat and power station of Vaesteraas during two firing seasons. The reliability of the measuring system has been tested at continuous drift. Mass flows of sulfur and nitrogen oxides have been calculated. Some results: - The measured values for gas concentrations and flow velocity often varied considerably during the day which depended on variations in the coal consumption. - The number of data that must be collected to calculate a correct mean value depends on the process that is supervised. For the investigated heat and power station, one hour mean values were found to be sufficient. - The 24 hour mean values for the measured parameters of the investigated heat and power station were calculated from one hour mean values. - Before a new measuring system is working well, a lot of improvements have to be done. The results will be further tested by a new measuring program that uses a dilution system instead of an extractive system for the gas preparation. (authors).

37711 **(SVF—280) NOsub(x) measurements at Soedertaelje and Helsingborg. Step 1 Measurement at the Igelsta Plant.** Fransson, K. (Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden)). Oct 1987. 32p. (In Swedish). NTIS (US Sales Only), PC A03. Order Number DE88753349/JAW.

The measurements of the NOsub(x)-emission after boiler P3 at the Igelsta Plant were carried out during the firing of two coal qualities, one from Poland and the other from England. The nitrogen content of the Polish coal was 1.2 per cent and that of the English coal was unexpectedly low, 1.5 per cent. All measurements have bee carried out close to the maximum effect of the boiler, which is 120 MW. The measurements when firing with the Polish and the English coal, respectively, shows that it has been possible to reduce the NOsub(x)-emission of the air distribution to the boiler with approx 13 per cent and 18 per cent, respectively, counted as NO/sub2/, down to 0.15 g/MJ fuel. The NOsub(x)-reduction was thus moderate despite heavily trimmed burners and with the boiler load constantly kept close to 100 per cent during the respective tests. When judging the results it should, however, be observed that the NOsub(x)-emission was fairly low at a normal adjusted boiler, approx 0.17 and 0.18 g/MJ, respectively, when firing with Polish and English coal, respectively. When the boiler was optimally adjusted and fired with Polish coal the air temperature leading to the wind boxes was decreased with 42 degrees centigrade, whereby an additional marginal reduction of the NOsub(x)-emission of 3 per

cent was received. Tests of short duration show that the NOsub(x)-emission is reduced when firing with O/sub2/-content less than 2.5 per cent in the fluegas. At normal load regulated operations the boiler cannot be fired with such a low excess of air, because of the severe decrease in carbon burnout.

37712 **(TUM-LSM—87/8) Off-gas concentrations in the vicinity of buildings in case of off-gas gas discharge through the roof and walls. Final report.** Jacobs, U.; Pernpeintner, A. (Technische Univ. Muenchen (Germany, F.R.). Lehrstuhl fuer Stroemungsmechanik). 1987. 96p. (In German). Technische Univ. Muenchen (Germany, F.R.). Lehrstuhl fuer Stroemungsmechanik.

This is a bibliographic study in which pollutant concentrations on the outer walls of buildings after exhaust discharge through the roof and walls are compared using empirical diffusion models. Pollutant concentrations on the roof and walls depend on the dilution of the off-gas. This means that pollution is low if stacks are at least 2,5 times as high as the building, while furnaces on the outer walls present a pollution problem. Model calculations are carried out to compare both types of pollutant emission.

37713 **(UCID—21355) An environmental analysis of metal particle dispersion from an explosive test at Tonopah Test Range.** Shinn, J.H. (Lawrence Livermore National Lab., CA (USA)). Mar 1988. Contract W-7405-ENG-48. 21p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008410/JAW.

The purpose of this report is to estimate the potential environmental effects resulting from a single explosive release of metal aerosols. The source of metal aerosols was a test-unit of an artillery projectile known as the XM785, which was detonated on the ground at Tonopah Test Range, Nevada, on August 6, 1987. The XM785 contained small amounts of beryllium (Be) and depleted uranium (DU) which formed particles in the smoke and stem of the cloud following explosion. The test unit was detonated in the middle of a barren dry lake (playa) known as Antelope Lake. The area surrounding Antelope Lake is sparsely vegetated with the Great-Basin type of shrub-chapparal of sage brush and grass species. The vegetation is lightly grazed by wild horses. Rodents are common and the major predator is the coyote. There are no aquatic biological resources in the area. The test was conducted under carefully controlled and monitored conditions to provide data in preparation for a proposed test series. Of chief environmental concern are the effects of Be and DU as potential agents of toxicity, resulting from exposure to the airborne metal particles or from their deposition. Data concerning the downwind concentration and deposition of Be and DU have been obtained from previous tests of a larger projectile, the XM753. The XM785 contained about one-half the Be and DU found in the XM753. 40 refs., 3 figs., 6 tabs.

37714 **(UCRL—15913) GEOTOX multimedia compartment model: User's guide.** McKone, T.E.; Gratt, L.B.; Lyon, M.J.; Perry, B.W. (Lawrence Livermore National Lab., CA (USA); IWG Corp., San Diego, CA (USA)). May 1987. Contract W-7405-ENG-48. 37p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008040/JAW.

This report describes how to use the GEOTOX programs. GEOTOX is a set of programs designed to calculate time-varying chemical concentrations in multiple environmental media and to estimate potential human exposures. The report provides a description of the partitioned environment that is modeled by GEOTOX, discusses the theoretical basis for compartment models, and presents the design criteria against which the model is judged. This is followed by a description of what the user must do to run GEOTOX on a particular system. A step-by-step tutorial for running GEOTOX programs is provided. A discussion of the functions of the GEOTOX models is given. Finally, a discussion of model inputs and outputs is provided. 3 refs., 8 figs.

37715 **Introduction of formate and acetate ions into precipitation: Assessment of possible pathways.** Chapman, E.G.; Sklarew, D.S. (Pacific Northwest Lab., P.O. Box 999, Richland, WA (US)). pp 219-228 of The chemistry of acid rain: Sources and atmospheric processes. Johnson, R.W.; Gordon, G.E.; Calkins, W.; Elzerman, A.Z. Washington, DC; American Chemical Society (1987). (CONF-8604366—).

From Chemistry of acid rain; New York, NY, USA (13 Apr 1986).

Statistical analysis of data from three sites in the eastern United States suggests that little or no correlation exists between low molecular weight organic and inorganic ion concentrations in precipitation, whereas organic ions such as formate and acetate are highly correlated and are probably introduced into precipitation by the same pathway. Based on agreement between observed and calculated potential clear air concentrations of formic and acetic acids, the most plausible pathway involves the scavenging of gas-phase-produced precursors. Further assessment of atmospheric hydrocarbon reactions is needed to better identify specific mechanisms and precursors in this pathway.

37716 **Accommodation coefficients of ozone and SO_2: Implications on SO_2 oxidation in cloud water.** Tang, I.N.; Lee, J.H. (Environmental Chemistry Div., Brookhaven National Lab., Upton, NY (US)). pp 109-119 of The chemistry of acid rain: Sources and atmospheric processes. Johnson, R.W.; Gordon, G.E.; Calkins, W.; Elzerman, A.Z. Washington, DC; American Chemical Society (1987). (CONF-8604366—).

From Chemistry of acid rain; New York, NY, USA (13 Apr 1986).

Interfacial mass transfer of trace gases into aqueous phase is investigated in a UV absorption-stop flow apparatus. For the first time, the mass accommodation coefficients are determined for O_3 (5.3×10^{-4}) and for SO_2 ($>2 \times 10^{-2}$). The results are incorporated into a simple model considering the coupled interfacial mass transfer and aqueous chemistry in cloud drops. it is shown that dissolution of O_3 into a drop is fast compared with its subsequent oxidation of dissolved SO_2. In addition, the conversion rate of S(IV) to S(VI) in aqueous drops by ozone reactions is not limited by interfacial resistance.

37717 **Field comparison study of polyurethane foam and XAD-2 resin for air sampling of polynuclear aromatic hydrocarbons.** Chuang, J.C.; Hannan, S.W.; Wilson, N.K. (Battelle Columbus Div., Columbus, OH (US)). pp 21-29 of Measurement of toxic and related air pollutants: Proceedings of the 1987 EPA/APCA symposium. Pittsburgh, PA; Air Pollution Control Assoc. (1987). (CONF-8705149—).

From EPA/APCA symposium on measurement of toxic and related air pollutants; Research Triangle Park, NC, USA (3 May 1987).

A study of the sampling efficiency for PAH in vapor using two adsorbents, XAD-2 resin and polyurethane foam (PUF) was performed under summer and winter ambient conditions. Two aspects were investigated: (1) collection efficiency for ambient PAH vapor and (2) retention efficiency for native and perdeuderated PAH spiked onto the adsorbents before sampling. Some spiked PAH which were volatile or reactive were recovered more efficiently with XAD-2 than with PUF. Lower sampling temperature improved the recovery for volatile PAH using PUF, but the recoveries of reactive PAH, such as cyclopenta[c,d]pyrene, were not improved at lower temperature for either adsorbent. An investigation of the stability of PAH collected on quartz fiber prefilters and XAD-2 or PUF backup traps as a function of the storage time was also carried out. Storage at room temperature in the dark for 30 days did not have an adverse effect on the collected ambient PAH or on the spiked perdeuterated PAH with XAD-2 resin. However, a decreasing concentration trend with storage time for naphthalene, anthracene and D_{12}-benzo[a]pyrene collected or spiked on PUF was found. Most of the particle-bound PAH collected on quartz fiber filters were not affected significantly during storage, except that cyclopenta[c,d]pyrene decreased to approximately half the original level after 30 days of storage. Investigation of the degradation product of cyclopenta[c,d]pyrene, pyrene dicarboxylic acid an-

hydride, showed that the levels of this compound collected on filters increased to about 1.5 times the original value after storage for 30 days.

37718 **Supercritical fluid extraction and recovery of PAH from air-borne particulates.** Hawthorne, S.B.; Miller, D.J. (Univ. of North Dakota, Energy Research Center, Campus Box 8213, Grand Forks, ND (US)). pp 63-68 of Measurement of toxic and related air pollutants: Proceedings of the 1987 EPA/APCA symposium. Pittsburgh, PA; Air Pollution Control Assoc. (1987). (CONF-8705149—).

From EPA/APCA symposium on measurement of toxic and related air pollutants; Research Triangle Park, NC, USA (3 May 1987).

Supercritical fluid extraction of PAH from particulates has several potential advantages over traditional methods such as Soxhlet extraction and sonication with liquid solvents. The solvent strengths of supercritical fluids can equal or surpass those of liquids, and can easily be controlled by choice of the supercritical fluids, the extraction pressure, or the addition of solvent modifiers. Many supercritical fluids are gases at room temperature which simplifies analyte concentration steps. The authors developed methodology for the supercritical fluid extraction of PAH from particulate samples that yields good recovery, requires only small (1-50 mg) samples, and is simple and rapid to perform. Supercritical ethane, CO_2, and N_2O (with and without 5% methanol modifier) have been evaluated for their ability to extract PAH from urban dust and fly ash. The most effective supercritical fluid (N_2O with 5% methanol modifier by volume) yielded quantitative recovery of PAH from urban dust (SRM 1649) in as little as 30 minutes. In general, 60 minute extractions of PAH from fly ash with supercritical N_2O5% methanol gave better recoveries than four hours of sonication or eight hours of Soxhlet extraction using either benzene or methylene chloride. A method for the direct coupling of the supercritical fluid extraction step with GCMS and GCFID has also been developed that allows for maximum sensitivity by transferring all of the extracted analytes directly into the gas chromatographic column for cryogenic trapping prior to gas chromatographic analysis. Analysis of PAHs from urban dust (SRM 1649) using coupled supercritical fluid extraction with GCMS gave good agreement with certified values.

5003 Radioactive Materials Monitoring And Transport

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

The surface area exposure through tritium washout by rain or snow can be described with the same model or the same constant $a = 3 \times 10^{-9}$ a mm^{-1} and s^{-1}. This constant can be applied both to single cases and to calculating the long-term mean. A limit is set in so far as the agreement cannot be used for the single washout event, but only for the average of many single events. The time-dependent tritium accumulation by plants is not taken into account by the 'specific activity model', but mean values of air, soil, and plant humidity can be compared.

37720 **(ES/ESH—4/V3) Environmental surveillance of the US Department of Energy Paducah reservation and surrounding environs during 1987.** Rogers, J.G.; Ashburn, D.L.; Aaron, M.R. (ed.). (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA); Paducah Gaseous Diffusion Plant, KY (USA)). Apr 1988. Contract AC05-84OR21400. 200p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88010748/JAW.

This two-part report reflects the results of a comprehensive, year-round program to monitor the impact of operations at the Paducah Gaseous Diffusion Plant (PGDP) on the area's groundwater and surface waters, soil, air quality, vegetation, and wildlife. In addition, an assessment of the relative effect of PGDP effluents on the resident human population is indicated. Environmental monitoring systems at PGDP include emission monitoring networks for airborne and aqueous discharges, groundwater, solid wastes, and ambient sampling networks for air, surface water, vegetation, food crops, fish, wildlife, soil, surface stream sediments, and radionuclide levels. The results of analyses and investigations are presented in this report and the major findings are summarized.

37721 **(EUR—10947) Environmental radioactivity, Ispra 1985.** Dominici, G. (Commission of the European Communities, Ispra (Italy). European Scientific Data Processing Center). 1987. 43p. (In Italian). Commission of the European Communities, Luxembourgh.

In this report there are briefly described the measurements of environmental radioactivity performed during 1985 by the site survey group of the Radioprotection Division at the Joint Research Centre Ispra Establishment. Data are given on the concentrations of ^{90}Sr, ^{137}Cs, and other radionuclides in precipitation, air, waters, herbage, milk and radioactive effluents. The environmental contamination is mainly world-wide fall-out.

37722 **(PNL—6464) Environmental monitoring at Hanford for 1987.** Jacquish, R.E.; Mitchell, P.J. (eds.). (Pacific Northwest Lab., Richland, WA (USA)). May 1988. Contract AC06-76RL01830. 272p. NTIS, PC A12/MF A01;1; GPO Dep. Order Number DE88011766/JAW.

Envoronmental monitoring activities performed on the Hanford Site for 1987 are discussed in this report. Samples of environmental media were collected to determine radionuclide and chemical concentrations at locations in the geographical area. Results are discussed in detail in subsequent sections of this report. Surveillance of radioactivity in the Hanford vicinity during 1987 indicated concentrations well below applicable DOE and US Environmental Protection Agency (EPA) standards. Radioactive materials released from Hanford operations were generally indistinguishable above background in the offsite environment. Continued influence from the 1986 reactor accident at the Chernobyl Nuclear Power Station in the USSR was not apparent this year. Chemical concentrations in air were below applicable standards established by the EPA and the State of Washington. Chemicals detected in the ground water beneath the Site can be attributed to both Site operations and natural background levels. Several chemicals regulated by the EPA and the State of Washington exceeded EPA drinking water standards (DWS). 106 refs., 71 figs., 110 tabs.

37723 **(SAND—88-0697) 1987 environmental monitoring report: Sandia National Laboratories, Albuquerque, New Mexico.** Millard, G.; Pei, P.; Felicetti, S.; Gray, C.; Thompson, D.; Phelan, J. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 4p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88010368/JAW.

Sandia National Laboratories Albuquerque (SNLA) is located south of Albuquerque on Kirtland Air Force Base. Because radionuclides are potentially released in small quantities from its research activities, SNLA has a continuing environmental monitoring program which analyzes for cesium-137, tritium, uranium, alpha emitters, and beta emitters in water, soil, air, and vegetation. Measured radiation levels in public areas were consistent with local background in 1987. A total of 7.7 curies of argon-41 were released as a result of SNLA operations in 1987. The Albuquerque population received an estimated 0.058 person-rem from airborne radioactive releases, whereas it received greater than 44,100 person-rem from naturally occurring radionuclides. A nonradioactive effluent monitoring program has been started at SNLA which includes groundwater, stormwater, and sewage monitoring. Results indicate that groundwater quality conformed the USEPA drinking water standards. Preliminary testing of stormwater showed that no pollutants were above minimum detectable levels. A program to investi-

gate potential remedial action sites has been started. 36 refs., 9 figs., 111 tabs.

37724 **(SAND—88-8206) 1987 environmental monitoring report, Sandia National Laboratories, Livermore, California.** Devlin, T.K. (Sandia National Labs., Livermore, CA (USA)). Apr 1988. Contract AC04-76DR00789. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011284/JAW.

Sandia National Labortories conduct various research activities related to Department of Energy interests which have the potential for release of hazardous materials or radionuclides to the environment. A strict environmental control program places maximum emphasis on limiting releases. The environmental monitoring program conducted by Lawrence Livermore National Laboratory and augmented by Sandia is designed to measure the performance of the environmental controls. The program includes analysis of air, water, soil, vegetation, sewer effluent, ground water, and foodstuffs for various toxic, hazardous, or radioactive materials. Based on these studies, the releases of materials of concern at Sandia during 1987 were well below applicable Department of Energy standards. 8 refs., 3 figs., 12 tabs.

37725 **Truncation effects on estimated parameters of tracer distributions sampled on finite domains.** Holland, J.Z. (Department of Meteorology, University of Maryland, College Park, Maryland). *Journal of Applied Meteorology;* 27: No. 3, 280-294(Mar 1988).

Methods are presented and demonstrated for compensating for the apparent effects of truncation of the sampled crosswind distribution of a tracer, at either or both boundaries of a surface sampling grid downwind from the point of release. Errors and corrections on estimates of the apparent vertical mixing depth, h, the location of the centroid of the crosswind distribution, y-bar, and the crosswind dispersion parameter, σ/sub y/, are those which would apply to a truncated Gaussian distribution having the observed moments (zeroth, first and second). For truncation on only one side of the tracer cloud, a linear relationship between certain measurable quantities based on moments of partial distributions is used to derive the parameters of a best-fit truncated Gaussian distribution by linear regression. The methods are illustrated by an example from the Cross Appalachian Tracer Experiment and by a Gaussian simulation.

37726 **Aqueous-phase reactions in clouds.** Schwartz, S.E. (Environmental Chemistry Div., Brookhaven National Lab., Upton, NY (US)). pp 93-108 of The chemistry of acid rain: Sources and atmospheric processes. Johnson, R.W.; Gordon, G.E.; Calkins, W.; Elzerman, A.Z. Washington, DC; American Chemical Society (1987). (CONF-8604366—).

From Chemistry of acid rain; New York, NY, USA (13 Apr 1986).

Reaction of dissolved gases in clouds occurs by the sequence gas-phase diffusion, interfacial mass transport, and concurrent aqueous-phase diffusion and reaction. Information required for evaluation of rates of such reactions includes fundamental data such as equilibrium constants, gas solubilities, kinetic rate laws, including dependence on pH and catalysts or inhibitors, diffusion coefficients, and mass-accommodation coefficients, and situational data such as pH and concentrations of reagents and other species influencing reaction rates, liquid-water content, drop size distribution, insolation, temperature, etc. Rate evaluations indicate that aqueous-phase oxidation of S(IV) by H_2O_2 and O_3 can be important for representative conditions. No important aqueous-phase reactions of nitrogen species have been identified. Examination of microscale mass-transport rates indicates that mass transport only rarely limits the rate of in-cloud reaction for representative conditions. Field measurements and studies of reaction kinetics in authentic precipitation samples are consistent with rate evaluations.

37727 **Chemical instrumentation of atmospheric wet deposition processes.** Tanner, R.L. (Environmental Chemistry Div., Dept. of Applied Science, Brookhaven National Lab., Upton, NY (US)). pp 289-303 of The chemistry of acid rain: Sources and atmospheric processes. Johnson, R.W.; Gordon, G.E.; Calkins, W.; Elzerman, A.Z. Washington, DC; American Chemical Society (1987). (CONF-8604366—).

From Chemistry of acid rain; New York, NY, USA (13 Apr 1986).

Field studies of wet deposition processes require the differentiation and determination of many reactive species at trace levels in clear-air gaseous and aerosol phases and in air containing clouds and precipitation. These studies have placed extremely rigorous requirements on existing analytical techniques and, in several instances, required development of new approaches to sampling and determination of critical species. Measurement techniques for nitrogen oxides and oxyacids, SO_2 and aerosol sulfate species, oxidant species including hydrogen peroxide and PAN, and various organic species in the gas, aerosol and, where appropriate, aqueous phases from airborne platforms are reviewed. Emphasis is on recent developments in real-time and short-term integrated measurements which permit the differentiation of below-cloud, within-cloud (interstitial), and aqueous phase species concentrations of oxidants, and of sulfuric and nitric acids and their precursors. Recent developments in measurement techniques for nitrogen oxides and gaseous H_2O_2 applicable to airborne sampling are highlighted.

37728 **(DOE/ID/12082—87) 1987 environmental monitoring program report for the Idaho National Laboratory site.** Chew, E.W.; Mitchell, R.G. (USDOE Idaho Operations Office, Idaho Falls. Radiological and Environmental Sciences Lab.). May 1988. Contract AS07-80ID12082. 69p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010304/JAW.

The results of the various monitoring programs for 1987 indicate that radioactivity from the Idaho National (INEL) Site operations could not, with the exception of Sb-125 in air, be distinguished from worldwide fallout and natural radioactivity in the region surrounding the Site. Although some radioactive materials were discharged during Site operations, concentrations and doses to the surrounding population were of no health consequence and were far less than State of Idaho and Federal health protection guidelines. This report describes the monitoring program, the collection of foodstuffs at the INEL boundary and distant offsite locations, and the collection of air and water samples at onsite and offsite boundary and distant locations. The report also compares and evaluates the sample results, discussing implications, if any. Significant environmental activities at the INEL Site during 1987, nonradioactive and radioactive effluent monitoring at the Site, and the US Geological Survey (USGS) ground-water monitoring program are also summarized. 33 refs., 13 figs., 13 tabs.

37729 **(SAND—88-0698) 1987 Environmental monitoring report: Tonopah Test Range, Tonopah, Nevada.** Millard, G.C.; West, G.L. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 36p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010106/JAW.

The Tonopah Test Range is located about 140 air miles northwest of Las Vegas, Nevada, and covers 624 square miles within the Nellis Air Force Base Bombing and Gunnery Range. The range is used for various US DOE and US DOD program tests that are critical to national defense. Activities that affect the environment are mainly road construction, preparation of instrumentation sites, and disturbance of the terrain from weapons testing. Monitoring of the test range is done routinely by the US Environmental Protection Agency (EPA) to supplement Sandia's monitoring effort associated with Sandia test activities. EPA monitoring results for 1987 indicate that test range operations do not adversely affect the off-site environment or the public. 14 refs., 2 figs., 9 tabs.

37730 **(SNV—3090) International evaluation of the environmental monitoring program, PMK.** (National Swedish Environmental Protection Board, Solna). Dec 1985. 36p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752946/JAW.

In 1978, the National Environmental Protection Board (SNV) in Sweden was commissioned by the Government to initiate the construction of a National Environmental Monitoring Programme, known as PMK. The following three major aims were set up for PMK through a decision process in Parliament and the Swedish Government. The overall programme design is based on them: - to monitor long-term and large-scale changes in the environment and in that way identify problems; - to collect data about environmental conditions in relatively unaffected tracts to permit well-founded assessments of the situation in more heavily impacted areas; - to illuminate how pollutants are transported. The evaluation of PMK made by an international Panel of experts has clearly shown this Programme generally to be of high quality and well under way to become ideally adapted to its aims. It is also our impression that PMK even in its present form yields very high value for the relatively small amounts of money it spends. We think PMK should be regarded as an asset both nationally and in an international perspective. The Panel concentrated most of its plenary discussions on PMK as a whole; several matters raised in connection with a special project or subprogramme were also found to be of a more general nature. Special attention is given in the report to conditions considered by us to be either excellent or less satisfactory, whereas conditions merely regarded as satisfactory are mentioned only briefly or not at all.

37731 **(SNV—3122) PMK - from the users point of view.** Engberg, H.; Swaren, U. (National Swedish Environmental Protection Board, Solna). 23 Apr 1986. 62p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752942/JAW.

This report gives an evaluation of the Environmental Monitoring program, PMK, from the users point of view. Several suggestions are given for measures that might increase the possibilities to use PMK data in routine environmental protection work. The report may also serve as an introduction to the activities present in the PMK project.

37732 **(AAEC/E—651) Neutron moisture probes : the minimum error attainable.** Wilson, D.J. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Apr 1987. 27p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702834/JAW.

The effect of the soil parameters dry density, mass absorption and mass scattering coefficients on the neutron flux at the detector of a neutron moisture probe has been described previously by a set of polynomial equations. The partial derivatives of these equations have been used to determine the deviation introduced into water density calculation by a one per cent inaccuracy in each of the parameters. Accuracy of measurement of the soil parameters is discussed and applied to a typical soil at various water densities. The accuracy to which soil parameters can be measured is examined and found to be approximately +- 2% for the dry soil density, +- 1% for the mass absorption coefficient and +- 2% for the mass scattering coefficient. Using these data, together with a statistical accuracy of +- 1% in the probe count rate, the minimum error achievable for the water density varies between +- 3.5% at a water density of 0.06 g cm^{-3} and +- 1.55% at a water density of 0.41 g cm^{-3}.

37733 **(CONF-8804148—1) Error propagation and uncertainty in process modeling.** Gardner, R.H.; Dale, V.H.; O'Neill, R.V. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 30p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011836/JAW.

From Conference on forest growth: process modeling of response to environmental stress; Gulf Shores, AL, USA (19 Apr 1988).

The principles and procedures for estimating uncertainties associated with model predictions have been extensively studied and applied to a broad spectrum of models. These studies have quantified relationships between data input, parameter estimation, and model results. Uncertainty analyses have also determined how additional data can improve the precision and reliability of predictions. The current challenge in applying error propagation techniques to forest process models lies with the development of a conceptual framework that can distinguish between: (1) effects due to stochastic variables such as weather; (2) the uncertainties associated with the measurement of detailed physiological processes; and (3) the variability in results caused by local stand-level phenomena.

37734 (INIS-BR—1018, pp 15) **Studies of the quantity variation of carbon-14 labelled pesticides in samples of soil from Northeastern, Brazil.** Farias, V.S.O.; Queiroz, F.G. de; Precker, J.W. (Paraiba Univ., Campina Grande (Brazil). Dept. de Fisica). 1987. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702601/JAW. (CONF-8711187—).

From 5. meeting of physicists from northeast; Natal, Brazil (12 Nov 1987).

37735 (INIS-BR—1018, pp 16) **Study of the motion of carbon-14 labelled pesticides in samples of soil from Northeastern Brazil.** Queiroz, F.G. de; Farias, V.S.O.; Precker, J.W. (Paraiba Univ., Campina Grande (Brazil). Dept. de Fisica). 1987. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702601/JAW. (CONF-8711187—).

From 5. meeting of physicists from northeast; Natal, Brazil (12 Nov 1987).

37736 **(ORNL/CDIAC—24-Vol.1) Bibliography on tropical rain forests and the global carbon cycle: Volume 1, An introduction to the literature.** Hall, C.A.S.; Brown, S.; O'Hara, F.M. Jr.; Bogdonoff, P.B.; Barshaw, D.; Kaufman, E.; Underhill, S. (Oak Ridge National Lab., TN (USA). Carbon Dioxide Information Analysis Center). May 1988. Contract AC05-84OR21400. 169p. NTIS, PC A08/MF A01;1; GPO Dep. Order Number DE88010761/JAW.

This bibliography covers the world literature on tropical rain forests, tropical deforestation, land-use change in the tropics, tropical forest conversion, and swidden agriculture as related to the global carbon cycle. Historic papers and books are included, but comprehensive coverage was only sought for 1980 through 1987. This compendium of nearly 2000 entries forms the point of departure for a series of bibliographies on this topic. Other works in this series will be on the global carbon cycle and rain forests in specific geographic areas, whereas this volume includes references to literature about the global carbon cycle and rain forests anywhere in the world. The bibliography is ordered alphabetically by author and is indexed by subject and author.

37737 **Neutronic properties of Mesaverde Sands: Pt. 1. Calibration of the Advanced Reactivity Measurement Facility.** Lysne, P. (Sandia National Labs., Albuquerque, NM (USA)). *Nuclear Geophysics;* 2: No. 2, 105-112(1988).

The Advanced Reactivity Measurement Facility (ARMF) at the Idaho National Engineering Laboratory is a small, light water moderated reactor. Access to this reactor is made through six experimental holes which possess neutron fluxes with different energy characteristics. When specimens are placed in these holes, thermal and higher energy absorption and scattering produce a linear per-

turbation to the reactor which is measured by movement of the regulating rod. Calibration was accomplished by placing eleven standard specimens in each of the six holes and solving for the appropriate calibration numbers in a least-squares sense. In the course of this calibration, it was found that two of the holes are redundant in that their fluxes are not significantly different from fluxes in the remaining holes. The resulting four-hole calibration yields cross section values with uncertainties of +- 0.2 CU(gmcm^3) for cross sections less than 9 CU(gmcm^3).

37738 **Ecological comparison of sympatric populations of sand lizards (Cophosaurus texanus and Callisaurus draconoides).** Smith, D.D.; Medica, P.A.; Sanborn, S.R. (Univ. of California, Los Angeles (USA)). *Great Basin Naturalist;* **47**: No. 2, 175-185(30 Apr 1987). Contract AC03-76SF00012.

Sympatric populations of Cophosaurus texanus and Callisaurus draconoides were periodically sampled from March 1973 through April 1974 at Burro Creek, Mohave County, Arizona. Callisaurus were also sampled at Rock Valley, Nye County, Nevada. Sex ratios were skewed in favor of males in the adult Cophosaurus but were equal in both adult populations of Callisaurus. Both species became sexually mature as yearlings. Mean clutch sizes were 3.55 (+/- 0.83) for Cophosaurus, and 4.25 (+/- 1.08) and 5.07 (+/- 1.33) for Callisaurus at Burro Creek and Rock Valley respectively. Evidence of multiple clutches was exhibited by both species. Egg weight/body weight ratios for both species and clutch weight/body weight ratios for Cophosaurus were notably smaller than previously reported. At Burro Creek both species were highly insectivorus, with orthopterans comprising the largest food group of each. Niche overlap for food was high at the ordinal level, but at the familial level it is apparent that Callisaurus probably fed in the more xeric areas of the riparian habitat. No differences were found in the temperature responses of these two lizards. However, minor temporal separations and substantial spatial partitioning were observed. Callisaurus preferred sandy open areas, while Cophosaurus preferred the presence of some rocks and boulders. 31 references, 2 figures, 8 tables.

37739 **Burrows of the sagebrush vole (Lemmiscus curtatus) in southeastern Idaho.** Mullican, T.R.; Keller, B.L. (Idaho State Univ., Pocatello (USA)). *Great Basin Naturalist;* **47**: No. 2, 276-282(30 Apr 1987).

Burrows of the sagebrush vole (Lemmiscus curtatus) were analyzed by injecting them with expanding polyurethane foam. Average mean depth +/- 1 SE of four burrows was 12.5 +/- 2.6 cm. Tunnels were wider than high and flat on the bottom. Three of four burrows were nearly linear, with an average of five entrances. Burrows usually contained one nest made of Artemisia tridentat bark. No middens or communal nests were found. The burrow structure in sagebrush habitat suggests that sagebrush voles occur singly or in pairs rather than in colonies.

37740 **Observations of captive Rocky Mountain mule deer behavior.** Halford, D.K.; Arthur, W.J. III; Alldredge, A.W. (Colorado State Univ., Fort Collins (USA)). *Great Basin Naturalist;* **47**: No. 1, 105-109(31 Jan 1987). Contract AS02-76EV01156.

Observations were made near Fort Collins, Colorado on the behavior of a captive herd of Rocky Mountain mule deer (Odocoileus hemionus hemionus). Comparisons in general behavior patterns were made between captive and wild deer. Similar behavior was exhibited by captive and wild deer. Captive deer (as well as other species) may be useful for study of certain behavioral aspects of their wild counterparts.

37741 **(AD-A—190447/3/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 7. Appendices A-3 and A-4. Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 396p. NTIS, PC A17/MF A01.

See also Volume 8, AD-A190 448.

Soil samples for chemical analysis were submitted to Radian Analytical Services (RAS) Laboratory. The samples were logged in, and the data reported in batches . Each batch submitted was assigned an RAS work order number. Table A.3-1 is a sequential listing of all analytical reports associated with AF Plant 4 Phase II, Stage 1 soil analyses by work order number. Table A.3-2 cross-references soil borings or well numbers, OEHL numbers, and the RAS work order numbers under which the results are located. Methyl ethyl ketone analyses were performed by the Radian chromatography laboratory. The results of these analyses are provided in a memo included in this volume. The RAS reports in the volume are arranged consecutively by RAS work order number. Pages in Appendix A are numbered by the volume number followed by the page number of the that volume. For example, Page 7 001 is Page 1 of Volume 7.

37742 **(AD-A—190448/1/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 8. Appendices B-E. Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 162p. NTIS, PC A08/MF A01.

See also Volume 9, AD-A190 449.

The overall objective of the Phase II investigation is to define the magnitude, extent, direction and rate of movement of identified contaminants. A series of staged field investigations may be required to meet this objective. The contractor shall determine any additional investigations required beyond this stage, including an estimate of costs, for possible performance under a separate contractual action. The purpose of this task is to conduct a contaminant source investigation at Air Force Plant 4 to determine: (1) the presence or absence of contamination within the specified areas of the field survey; (2) if contamination exists, the potential for migration in the various environmental media; (3) the extent/magnitude of contamination on the Air Force Plant 4 property; and (4) potential environmental consequences and health risks of migrating contaminants based on state or federal standards for these contaminants.

37743 **(CONF-8804133—1) The potential of trees to record aluminum mobilization and changes in alkaline earth availability.** Bondietti, E.A.; Baes, C.F. III; McLaughlin, S.B. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 14p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010437/JAW.

From Workshop on markers of air pollution effects in forests; Asheville, NC, USA (25 Apr 1988).

The mobilization of exchangeable soil cations by atmospheric depositions of mineral acid anions and the distribution of polyvalent cations in the xylem are described to provide the basis for interpreting both radial concentration and concentration ratio patterns of polyvalent cations in annual growth rings of trees. There is strong circumstantial evidence that increases in Al:Ca ratios in annual rings are related to aluminum mobilization, and that changes in the availability of alkaline earth elements and radial growth rated may also be related to cation mobilization. Suggestions for further research are presented.

37744 **(CONF-8804133—2) Markers of air pollution in forests: Nutrient cycling.** Johnson, D.W.; Van Miegroet, H.; Swank, W.T. (Oak Ridge National Lab., TN (USA); Coweeta Hydrologic Lab., Otto, NC (USA)). 1988. Contract AC05-84OR21400. 12p. (CONF-8804133—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011011/JAW.

From Workshop on markers of air pollution effects in forests; Asheville, NC, USA (25 Apr 1988).

Air pollution may alter either the nutrient content or the flux rates in forest ecosystems, but, with a few exceptions (e.g., SO_4/sup 2{minus/} in foliage, Al/sup 3{plus/} or Pb in tree rings), flux measurements provide more sensitive measures of air pollution effects. However, nutrient pools may be significantly affected by air pollution over long periods of time, and the importance of sample archiving as a means of detecting these long-term changes in nutrient pools (e.g., soils) cannot be overemphasized. Acid deposition andor foliar damage by ozone may cause increased foliar leaching, but the degree to which air pollution affects foliar leaching is very difficult to assess in the absence of control sites for comparison. Decomposition may also be altered by increased acid input, trace metal deposition, or gaseous pollution; but, once again, many of these potential changes are very difficult to evaluate for lack of control sites. Acid deposition nearly always influences soil leaching rates to some degree. In the case of SO_4/sup 2{minus/}, reasonable assumptions about background concentrations often allow an approximate estimate of the degree to which leaching is affected by sulfate deposition. For NO_3/sup {minus/}, there is considerably less certainty about exactly what background levels should be. It is therefore more difficult to evaluate the degree to which current NO_3/sup {minus/} leaching rates are affected by atmospheric N deposition without a full analysis of the N cycle of the ecosystem in question.

37745 **(CONF-8805103—1) Developing a hazardous materials evacuation plan.** Newsom, D.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009966/JAW.

From Hazardous material spills conference; Chicago, IL, USA (16 May 1988).

Effective response to hazardous material spills can be aided by development of an evacuation plan, as part of, or as an adjunct to, other emergency response plans. Valuable standards for the development of such plans can be gleaned from corresponding standards published for radiological emergency response plans. Computer aids presently available have some limitations, but can be of significant help in evacuation planning. 5 refs.

37746 **(EPRI-EA—5715) Seminar on remote sensing of forest decline attributed to air pollution: Proceedings.** Nilsson, S.; Duinker, P.N. (Electric Power Research Inst., Palo Alto, CA (USA)). Apr 1988. 252p. (CONF-8703261—). Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88009901/JAW.

From Seminar on remote sensing and forest decline attributed to air pollutants; Laxenburg, Austria (11 Mar 1987).

The purpose of the seminar was to bring together experts from Europe and North America to review the state of the art in remote sensing of forest decline, and to review a proposal from Sweden for a Europe-wide survey of forest decline using satellite imagery. In addition to presentations on the Swedish proposal, the Seminar included sessions on monitoring of forest resources, and past and current applications of remote sensing to assess forest decline in Europe and North America. The method presented in the proposal by Satimage Corporation of Sweden seems to be efficient in identifying severe damage to forests, but there are problems in identifying light damage. The method has not been evaluated yet for hardwoods. There are great difficulties today in generating a sound picture of the extent of forest decline in Europe and North America. This is a result of the fact that data about forest damage are collected in different ways from country to country. There is a need to develop and employ a standardized monitoring method, and the method presented at the Seminar can play a role in this process. These Proceedings contain papers submitted by authors of 18 of the 21 presentations made at the seminar, plus a summary of the Seminar prepared by the organizers.

37747 **(EPRI-EA—5741) Chromium reactions in geologic materials: Interim report.** Rai, D.; Zachara, J.M. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. 263p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88007528/JAW.

This report contains new laboratory data and equilibrium constants for key reactions needed to predict the geochemical behavior of Cr in soils and groudwater. These new data include 1) the solubility of $BaCrO_4$(c) and Ba(S,Cr)O_4(c) solid solutions, 2) the Fe(II)-mediated reduction of Cr(VI) to Cr(III), and 3) Cr(VI) adsorption by kaolinite and Al-substituted goethite. The new mechanistic data along with the previously developed data have improved the understanding of reactions that limit Cr(III) and Cr(VI) mobility in soils and groundwater. Experiments show that both $BaCrO_4$(c) and Ba(S,Cr)O_4(c) solid solution form rapidly under the geochemical conditions expected in the environment. Solubility products were experimentally determined for $BaCrO_4$(c) and for Ba(S,Cr)O_4(c) at several mole fractions of Cr(VI). The Ba(S,Cr)O_4(c) solid solution is of special importance because it maintains lower aqueous Cr(VI) concentrations than $BaCrO_4$(c) and is likely to form and control Cr(VI) mobility in the utility environment, where Ba/sup 2{plus/} levels are controlled by $BaSO_4$(c). The ferrous ion [Fe(II)] was found to be a rapid and effective reductant for Cr(VI) to Cr(III). This redox transformation is important in predicting migration of chromium species because the resulting Cr(III) concentrations in groundwater are kept low by the solubility of $(Cr,Fe)(OH)_3$. Chromium(VI) adsorption was measured on kaolinite and Al-substituted goethite. Both solids adsorb Cr(VI) only under acidic and near-neutral conditions. The observed Cr(VI) adsorption by both solids was described with a multiple-site surface complexation model and binding constants for single-phase oxides. 132 refs., 68 figs., 27 tabs.

37748 (Juel-Spez—413, pp 46-48) **Investigation of the distribution of airborne pollutants and their deposition in forests of the Black Forest and Schoenbuch mountains.** Baumbach, G. 37757 (KTM/E-D—137) **Effects of acid deposition on the catchment area of lake Marsjoen - basic study.** Uotila, I. (Kauppa-ja Teollisuusministerio, Helsinki (Finland). Energiaosasto). Aug 1987. 107p. (In Finnish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752825/JAW.

Evidence of the acidification of soil and watercourses observed in Europe and North America has been found in Finland in recent years, too. A study into acidification, financed by Imatran Voima Oy (IVO) and the Ministry of Trade and Industry, has been carried out in Inkoo, in the little Marsjoen lake and its catchment area. The area is situated in the neighbourhood of the coal-fired power plant of Inkoo. The study was begun in 1983 and the present final research report compiles the results from the period 1 July 1983 to 30 June 1986. The objective of the study was to establish the quality of the air-transported compounds and their effects on the ecosystem. During the research period, pH of the rain water in open areas was 4.0-5.0 and under the canopy 3.0-4.5. The annual sulphu deposition was some 1.0 g/m"2, but including the canopy throughfall, the average deposition in the area totalled some 1.7 gS/m"2 annually. Total nitrogen deposition averaged 0.9 g N/m"2 annually. Some 75% of the strong acid in precipitation is caused by sulphuric acid and 25% by nitric acid. The alcalinity values of the lake were relatively high and its buffer capacity has been sufficient to neutralize the acid deposition so far. No signs of acidification in water plants and fishes were observed. The groundwater studies, however, evidenced a decrease in the alcalinity level. The state of forests and forest lands was found normal. An ion budget representing the acidification development in the catchment area was worked out. This budget indicates that the buffer capacity of the soil has been sufficient to neutralize the acid load so far. Acidification of the catchment area thus does not seem to be a concern of the near future.

37758 (LBL—25217) **Transport of a conservative solute through a shallow pond bottom.** Long, R.H.; Benson, S.; Alavi, M.; Narasimhan, T.N. (Lawrence Berkeley Lab., CA (USA)). Apr 1988. Contract AC03-76SF00098. 20p. (CONF-8804135—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010883/JAW.

From 8. annual AGU front range branch hydrology days; Fort Collins, CO, USA (19 Apr 1988).

A field experiment has been performed in an evaporation pond at Kesterson Reservoir, Merced County, California, aimed at determining average solute fluxes through pond sediments and at estimating the magnitude and degree of spatial variability of water and solute transport properties. Kesterson Reservoir, a series of shallow ponds located at the terminus of the San Luis Drain, became the object of intense public interest and scientific investigation after it was discovered in 1983 that the disposal of irrigation drain waters bearing hazardous levels of a naturally occurring element, selenium, was having serious environmental effects on plant and animal life. The primary focus of the experiment was to gain insight into the mechanism of selenium migration and immobilization. As a first step in analyzing the selenium migration data, permeability and apparent dispersion coefficient values were obtained through the history-matching of breakthrough curves of a conservative solute, chloride, at 40 sampling locations within 5 sites throughout a 40-ha (100-acre) cell following pond-flooding. Chloride occurring naturally throughout the soil profile was utilized in a modeling effort as a conservative tracer under conditions of transient flow, and a deterministic one-dimensional fluid flow and transport mathematical model employing the integrated finite difference method (IFDM) was employed in the effort. 29 refs., 9 figs., 1 tab.

37759 (LUNBDS-NBNB—1013-1-86-1986) **Soil microbial effects of smelter induced heavy metal contamination.** Nordgren, A. (Lund Univ. (Sweden). Dept. of Technical Microbiology). 1986. 29p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753328/JAW.

The soil concentrations of Cu and Zn at the secondary smelter were 20 00 mu g/g dry soil. Close to the primary smelter the soil was contaminated with more than ten elements including Pb, Zn, Cu and As at levels ranging between 6000 and 1000 mu g/g dry soil. The correlations between the concentrations of the metals were high at both smelters. Soil respiration rate decreased by about 75% close to both smelters. Total and fluorescein diacetate stained mycelial lengths decrease with increasing heavy metal pollution at the secondary but not at the primary smelter. The fungal community structure was strongly affected by the contamination. General common in coniferous forest soils such as Penicillium and Oidiodendron virtually vanished, while less frequent species like Paecilomyces farinosus and Geomyces pannorum dominated the site close to the smelter. Colony forming units of a number of functional groups of bacteria were found to be very sensitive to metal contamination. The urease activity of the soil was inhibited. Multivariate statistical analyses showed that the metal contamination was the major environmental influence on the microbiotain the soils studied. A study of about 200 decomposition curves resulting from glutamic acid additions to the different soils produced four

microbially related parameters: basal respiration rate, initial respiration rate after the addition of the glutamic acid, specific respiration rate during the exponential increase of the respiration rate and the lag time before the exponential phase. With 53 refs.

37760 (PB—88-182076/XAB) Accidentally spilled gas-oil in a shoreline sediment on Spitsbergen: natural fate and enhancement of biodegradation. Sveum, P. (SINTEF, Trondheim (Norway)). 29 Dec 1987. 21p. (STF—21-A87111). NTIS, PC E03/MF E03.

The oil-soluble fertilizer Inipol EAP22 has been used on shore as a treatment agent after an accidental marine gas-oil contamination on Spitsbergen. A 60% increase in the biodegradation of the aliphatic fraction was obtained as a maximum. Due to the high rate of physical self-cleaning (about 90%), the importance of the biodegradation for the total self-cleaning was limited.

37761 Terrestrial ecosystems: Wet deposition. Shriner, D.S. (Environmental Sciences Div., Oak Ridge National Lab., Oak Ridge, TN (US)). pp 365-388 of Air pollutants and their effects on the terrestrial ecosystem. Legge, A.H.; Krupa, S.V. New York, NY; John Wiley and Sons Inc. (1986).

One of the most rapidly growing areas of research into the effects of air pollutants on terrestrial ecosystems during the past decade has been wet deposition of pollutants and the subsequent effects of those precipitation-deposited pollutants on vegetation and soils. The objectives of this paper are to review the state of their collective knowledge on the effects of wet deposition of pollutants, to identify where research to date has left gaps, and to present their views on the future research needs in this area. After a decade of rather intensive research into the effects of wet deposition of pollutants on vegetation, a number of conclusions can be drawn about the way in which wet deposition affects vegetation. This review does not present an account of all of the individual research efforts which comprise their corporate knowledge; instead, it concentrates on those common conclusions they may draw as well as on those inconsistencies which have appeared thus far. On the basis of those commonalities and inconsistencies, perhaps a clearer picture of research needs will emerge.

37762 Effects of gaseous air pollutants on terrestrial vegetation. Heck, W.W.; McLaughlin, S.B. (US Dept. of Agriculture, North Carolina State Univ., Raleigh, NC (US)). pp 325-336 of Air pollutants and their effects on the terrestrial ecosystem. Legge, A.H.; Krupa, S.V. New York, NY; John Wiley and Sons Inc. (1986).

On a global scale, terrestrial vegetation is exposed intermittently to gaseous air pollutants. Under some conditions the exposure may be continuous, but generally the exposure concentrations are variable. Similarly, the response of vegetation is variable depending upon factors both external and internal to the plant. Under some conditions, the effects may be beneficial or benign; under others, the effects may be harmful or disastrous. The effects may be acute or chronic, reversible or irreversible, direct (via foliar absorption) or indirect (via deposition on the soil and uptake by roots). The effects may be a direct result of a specific chemical species or of various combinations of chemical species (e.g., $SO_2 + O_3 + NO_2$). Growth and yield responses can occur without classical injury symptoms and may occur without any appearance of foliar abnormalities. Complex interactions between air pollutants and both biotic and abiotic environmental factors also occur.

37763 (BMU—1987-160) Radio/ecological studies on the air-soil-vine-wine food chain. 4. interim report. Wagner, A. (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Bundesforschungsanstalt fuer Ernaehrung, Karlsruhe (Germany, F.R.). Zentrallaboratorium fuer Isotopentechnik). 1987. 100p. (In German). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen,, Germany, F.R.

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

The report summarizes the results of the first three years (1983-85) of the radio-ecological studies on wine which were performed on eight sites from major German wine-growing regions involving red and white wine varieties typical of their region. The radionuclides of tritium, carbon 14, strontium 90, cesium 137, radium 226 and sodium 40 were examined for their contents and presence in the food chain of air-soil-vine-wine in order to determine the pollution situation in grapes and wine and to gain information on their behaviour in the food chain. A number of soil parameters important for nutrient uptake were determined to describe the site.

37764 (CONF-880631—2) Analysis of radiological survey data to determine contaminated waste volumes. Yu, Charley. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 6p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009960/JAW.

From 29. annual meeting of the Institute of Nuclear Materials Management; Las Vegas, NV, USA (26 Jun 1988).

A procedure was developed to analyze radiological survey data from a contaminated material that has to be cleaned up or removed before the site can be released for unrestricted use. This procedure was coded in a FORTRAN computer program, RADVOL. The survey data are analyzed statistically by averaging over an area of 100 $m_3$and a depth of 0.15 m; the Kσ error is used to calculate the net count rate, where K depends on the confidence level required. The net count rates are converted to radionuclide concentrations and compared with the residual radioactive material guidelines to determine if the block (100 m_3 {times} 0.15 m volume) is contaminated (above guidelines). The analytical results are plotted three-dimensionally, which perspectively illustrates the contamination level of each block. This procedure was tested by using radiological survey data from an actual site contaminated with radium. The results indicate that this procedure is easy to use and can be applied to those sites where radiological survey data are available. The uncertainties in the procedure are also discussed.

37765 (DOE/NV/10327—30) Operation charioteer - onsite radiological safety report for announced nuclear tests, October 1985-September 1986. Mullen, O.W.; Eubank, B.F. (Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (USA)). Jun 1988. Contract AC08-84NV10327. 130p. NTIS, PC A07/MF A01; 1; GPO Dep. Order Number DE88011878/JAW.

Charioteer was the name assigned to the series of underground nuclear experiments conducted at the Nevada Test Site from October 1, 1985 through September 30, 1986. This report includes those experiments publicly announced. Remote radiation measurements were taken during and after each nuclear experiment by a telemetry system. Monitors with portable radiation detection instruments surveyed reentry routes into ground zeros before other planned entries were made. Continuous surveillance was provided while personnel were in radiation areas and appropriate precautions were taken to protect persons from unnecessary exposure to radiation and toxic gases. Protective clothing and equipment were issued as needed. Complete radiological safety and industrial hygiene coverage were provided during drilling and mineback operations. Telemetered and portable radiation detector measurements

are listed. Detection instrumentation used is described and specific operational procedures are defined.

37766 **(DPST—88-256) Identification of stress areas associated with H- and F-area seepage basins using high-hesolution aircraft MSS [Multispectral Scanner] data for April 1987.** Jensen, J.R.; Mackey, H.E. Jr. (South Carolina Univ., Columbia (USA). Dept. of Geography; Savannah River Lab., Aiken, SC (USA)). Feb 1988. Contract AC09-76SR00001. 20p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008214/JAW.

The F- and H-Area seepage basins located on the Savannah River Plant (SRP) have been in operation since the mid-1950's for the handling of wastes from the nuclear separation facilities. The H-Area seepage basins are located on the central portion of the SRP between Upper Three Runs Creek and Four Mile Creek. The H-Area seepage basins receive liquid waste containing low-level radioactivity and chemicals. The four H-Area basins cover an area of approxiamtely 5.6 {times} 10^4 m^2. Although senesced vegetation was identified in the pine and hardwood vegetation stands using the high resolution multispectral scanner (MSS) data and the unsupervised digital image processing techniques described, the agent(s) responsible for the stress are not known at this time. Therefore, these results identify vegetated areas that have experienced some senescence due to unknown factors. It appears that the H-Area seepage basins have produced a sizeable "question mark" shaped stress area just south of basin 4. The location of the stressed area lies in the same downgradient area as the high nitrate concentrations. An area along Four Mile Creek exhibited stress characteristics. Upland from the H-Area basins the vegetation is also stressed. Some of these areas were used as borrow pits in the past resulting in nutrient depleted soils. 7 refs., 10 figs.

37767 **(FERMILAB—88/40) Site environmental report for calendar year 1987.** Baker, S.I. (Fermi National Accelerator Lab., Batavia, IL (USA)). 1 May 1988. Contract AC02-76CH03000. 69p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010978/JAW.

Fermilab conducted a full year of high-energy physics research in CY-1987. The colliding beam physics program began in early January and extended into May. During the colliding beams run a total of 54 curies (Ci) of ^{11}C, ^{13}N, and ^{41}Ar were released from the Antiproton Source stack. During the fixed target program a total of 27 curies of radioactive gas, primarily ^{11}C, were released from the Neutrino Area stack. There was a negligible exposure from penetrating radiation during the colliding beams experiments; however, muons from the new Muon Laboratory gave a maximum site boundary potential exposure equal to the highest previous annual potential exposure which occurred in 1976. This result gave a total potential radiation exposure of 13 millirem (mrem) at the site boundary during CY-1987 compared to an average of 3.3 mrem per year for the previous years. The total potential radiation exposure to the general off-site population from Fermilab operations during CY-1987 was 5.3 person-rem, or about twice the average of 2.4 person-rem per year from previous operations. Since the exposure is from penetrating radiation, the 50 year dose commitment from operations in 1987 will be the same as the exposure received in 1987. The total release of airborne radioactivity was 81 Ci from venting of air containing short half-life radionuclides. The off-site release of tritium surface water totaled approximately 266 mCi. 43 refs., 11 figs., 10 tabs.

37768 **(GEPP-EM—1114) 1987 Pinellas Plant environmental monitoring report: Environmental health and safety programs.** (General Electric Co., Largo, FL (USA). Neutron Devices Dept.). Apr 1988. Contract AC04-76DP00656. 43p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010334/JAW.

The effluent and environmental monitoring programs maintained by the Pinellas Plant are designed to determine the efficiencies of treatment and control mechanisms for environmental releases, provide measurements of discharge concentrations for comparison with applicable standards, assess the concentrations of these discharges in the on-site environment, and provide a data base for computer programs to calculate the potential dose to the public resulting from the operation of the Pinellas Plant. In 1987, as in previous years, the environmental effects of radiological and nonradiological effluents from the operation of the Pinellas Plant have been demonstrated to be insignificant. 21 refs., 1 fig., 6 tabs.

37769 **(INIS-mf—11133) Manual for the sampling of uranium mine tailings.** Feenstra, S.; Reades, D.W.; Cherry, J.A.; Chambers, D.B.; Case, G.G.; Ibbotson, B.G. (Golder Associates, Toronto, Ontario (Canada)). Apr 1983. 179p. NTIS (US Sales Only), PC A09/MF A01. Order Number DE88702091/JAW.

Report to Energy, Mines and Resources Canada.

The purpose of this manual is to describe the requisite sampling procedures to provide a basis for the application of uniform high-quality standards to detailed geotechnical, hydrogeological, geochemical and air quality measurements at Canadian uranium tailings disposal sites. The report describes the objective and scope of a sampling program, the preliminary data collection, and the procedures for sampling of tailings solids, surface water and seepage, tailings porewater, and wind-blown dust and radon.

37770 **(ISH—96) Applicability and reliability of the 'observed ratio' model as a means of describing the strontium and the cesium transfer from soil to plant.** Leising, C. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Dec 1986. 89p. (In German). Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

The report examines the suitability of the observed ratio, (OR), model as a means of describing the soil-to-plant transfer of cesium and strontium, and the reliability of results determined by this model. Literature studies have been made and are reported in order to show the discrimination between Sr and Ca, or Cs and K, respectively, and in order to show the magnitude of the OR value and the range of values it may cover. For the evaluation of results, care has been taken that only the physiologically relevant constituents of Sr, Ca, Cs, and K concentrations in the soil are taken into account, which are the water-soluble and the adsorptively bound forms. Non-mobile forms cannot be taken up by the plant and therefore are not considered in the model. In accordance with the literature reviewed, the report also differentiates between two experimental approaches: (1) hydroponics, and (2) greenhouse or field experiments.

37771 **(KFK—4311) Radioactivity in forests and single trees caused by the Chernobyl reactor accident.** Koenig, L.A.; Fessler, H.; Hempelmann, S.; Milbich-Muenzer, F. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit). Dec 1987. 26p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753388/JAW.

The activity deposited per km^2 in the Karlsruhe region is comparable with the sum of aerosols released from all nuclear power plants in the Federal Republic of Germany. Results of measurements performed in 1986 on leaf and needle samples are compared to the corresponding results obtained in 1987. The behavior of cesium activity in trees is discussed. In addition the results of measurements made in 1987 on small vegetation, especially mushrooms, are indicated. The Cs-activity expected to be found in the meat of deer of the same region is estimated.

37772 **(ORNL/M—556) Statement of work for the assessment of ambient environmental monitoring programs for the installations operated by Martin Marietta Energy Systems, Inc., at Oak Ridge, Tennessee; Paducah, Kentucky; and Portsmouth, Ohio.** Rogers, J.G. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)). Jun 1988. Contract AC05-84OR21400. 47p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011093/JAW.

This report describes a review of the ambient environmental monitoring programs at the five Department of Energy installations for compliance and consistency with DOE and Energy Systems policies and strategies, DOE Orders, environmental laws and regulations, and the current best monitoring practices. The scope of the assessment shall include the ambient air, water, groundwater, biological, and radiological environmental monitoring performed near

plant perimeter fences, in receiving streams, and at off-site locations. The scope of this task does not include assessing the on-site point source emission monitoring associated with specific stack sampling locations. It does not include specific National Pollutant Discharge Elimination System (NPDES) water monitoring and biological monitoring locations, nor does it include on-site groundwater monitoring locations. The scope of the assessment shall include the ambient air monitoring programs at each site and off-site; the surface water monitoring programs; and the off-site programs associated with the sampling of fish, wildlife, milk, groundwater, soil, vegetation, and stream sediments. Both radiological and nonradiological parameters should be reviewed and evaluated. The current monitoring locations should be evaluated to ensure that they are the appropriate locations to provide usable and defensible data. The current monitoring location to be evaluated at each site are shown in the tables included in this SOW. Also, the current parameters and sampling frequencies must be evaluated for adequacy. The tables outline the current ambient monitoring programs at each installation. 32 figs., 12 tabs.

37773 **(PNL-SA—15721) Modeling the dynamics of long-term cycling and storage of ^{137}Cs in forested ecosystems.** Van Voris, P.; Cowan, C.E.; Cataldo, D.A.; Wildung, R.E.; Shugart, H.H. (Pacific Northwest Lab., Richland, WA (USA); Virginia Univ., Charlottesville (USA)). Apr 1988. Contract AC06-76RL01830. 23p. (CONF-880367—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009487/JAW.

From SCOPE-ENUWAR workshop on the environmental consequences of nuclear war; Moscow, USSR (20 Mar 1988).

A microcomputer digital simulation model (RADFORET) was developed to predict the long-term ({approximately}250 years) cycling of radiocesium in forested ecosystems using detailed ^{137}Cs distribution data from two ecosystems. The primary forcing functions for the model were the concentration of^{137}Cs in the soil compartment and the rate of forest growth. Parameters were set for controlling the movement of ^{137}Cs from soil into, and the subsequent cycling within, the biotic compartments of the model for each ecosystem. The amount of the ^{137}Cs available for uptake from the soil was inversely correlated with the clay content in the soil from each site and was positively correlated with cation exchange capacity (CEC) and soil organic matter. The effect of forest growth as a forcing function in the ^{137}Cs cycling model was stimulated by coupling the output of a microcomputer digital simulation forest growth sucession model (FORET) to the cycling model. Thus, the radiocesium concentration in each of the seven compartments of the model resulted from both the donor-controlled linear differential equation model of radiocesium concentration in the soil and the dynamics of forest biomass over time. Forecasts of ^{137}Cs distribution in the donor-controlled model favorably compared with actual ^{137}Cs distribution in forests at Oak Ridge, Tennessee, and Savannah River, Georgia. This comparsion provided a measure of model validity for additional simulations of projected radiocesium cycling in the forests around the Chernobyl nuclear reactor accident site in the USSR.

37774 **(RHO-RE-SA—191-P) Transuranic measurements for in situ vitrification.** Subrahmanyam, V.B. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). May 1987. Contract AC06-77RL01030. 44p. (CONF-880601—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE87009333/JAW.

From American Nuclear Society annual meeting; San Diego, CA, USA (12 Jun 1988).

Radioactivity in soil below the crib 216-Z-12 in 200 West Area of Hanford was characterized. Four collinear wells in East-West direction were drilled for this investigation. Soil samples from different locations of three cores from 18 to 28 feet depths were analyzed. Actinides, ^{241}Am, ^{239}Pu, and ^{237}U and fission products ^{154}Eu and ^{137}Cs were detected in a well-defined narrow layer (<2 feet) at the crib bottom. Spatial distribution of activity and moisture content were also investigated. The major component of observed radioactivity was due to transuranium isotopes, with three to four orders of magnitude lower activity from the other nuclides. The maximum detected specific activity of 3000 +- 300 nCig may represent the retention capacity of the soil. The highest activity position varied in depth from 20.5 to 22.6 feet with higher activity occurring at deeper locations away in both directions from the effluent discharge pipe. The full width at half maximum (FWHM) activity was 0.2 foot in the western well and increased gradually to 1.2 feet in the eastern well. The activity layer in the investigated vertical plane could be represented by average values, for specific activity and FWHM, respectively, of 3000 nCig and 0.82 foot. 14 refs., 9 figs.

37776 **(DOE/EA—0291) Environmental assessment: Warren Air Force Base 115-kV transmission line, Cheyenne, Wyoming.** (USDOE Western Area Power Administration, Washington, DC). Mar 1986. 47p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008871/JAW.

The Western Area Power Administration (Western), is propsoing to construct a new electrical tranmission line and substation in southeastern Wyoming. This proposed line, called the Warren Air Force Base Tranmission Line, will supply power for Western's system to Francis E.Warren Air Force Base (F.E. Warren AFB) near Cheyenne. It would allow for increased tranmission capacity to the air base. F.E. Warren AFB currently is served electrically be Western via a 13.8-kv line. It is a wood-pole, double-circuit line without an overhead ground wire, which extends from Western's Cheyenne Substation, through an urban area, and onto the air base. The Cheyenne Substation is located on the south side of the city of Cheyenne. The electrical load on the base is increasing from 4 megawatts (MW) to 11 or 12 MW, an approximate three-fold increase. Voltage problems occasionally occur at the base due to the present electrial loads and to the age and inadequacy of the 13.8-kv line, which was placed in service in 1941. The existing line has served beyond its designed service life and requires replacement. Replacement would be necessary even without an increasing load. F.E. Warren AFB has several new and expanding programs, including additional housing, shopping centers, and the Peacekeeper Missile Program. Part of this expansion already has occured; the remainder is expected by early 1988. This expansion has created the need for additional electrical service. The present 13.8-kV line is not capable of supporting the additional load. 28 refs., 4 figs., 2 tabs.

37777 **(DOE/EIS—0107-F) Mead-Phoenix +-500 kV DC transmission line project: Final environmental impact statement.** (USDOE, Washington, DC). Feb 1986. 67p. NTIS, PC A04;3. Order Number DE88011477/JAW.

This environmental impact statement (EIS) assesses the environmental effects of Western Area Power Administration's (Western), Salt River Project's, Southern California Public Power Authority's, and Modesto-Santa Clara-Redding Public Power Agency's (MSR) proposal to construct, operate, and maintain a +-500-kV direct current (DC) transmission line from the proposed Eastwing Terminal near Phoenix, Arizona, to the Mead Substation near Boulder City, Nevada. The Mead-Phoenix transmission system will initially be designed to transfer 1600 megawatts (MW) between the Phoenix area and southern Nevada, with ultimate capacity of up to 2200 MW. Alternatives assessed include routing, design, and system alternatives. 1 fig., 4 tabs.

37778 (DOE/EIS—0116-FS) Blue River-Gore Pass portion of the Hayden-Blue River transmission line project, Grand and Summit Counties, Colorado: Final supplemental environmental impact statement. (USDOE Western Area Power Administration, Washington, DC). 1986. 209p. NTIS, PC A10;3. Order Number DE88011450/JAW.

This environmental impact statement (EIS) assesses the environmental effects of constructing, operating, and maintaining about 30 miles of 230/345-kV transmission line between the existing Gore Pass Substation northwest of Kremmling, Colorado, and a proposed new substation (not part of this action) near the Ute Pass Road. The action includes minor work at the Gore Pass Substation and two taps, and also the removal of two existing transmission lines; a 69-kV line between Gore Pass Substation and Green Mountain Power Plant and a 115-kV line between Green Mountain Power Plant and Blue River Tap. The purpose of the project is to provide additional transmission capacity onto the areas of Gore Pass, Granby, Green Mountain, Dillon, Climax, Oak Creek, and Keystone, and between the generation plants in western Colorado and the major load areas in eastern Colorado. Alternatives assessed include routing and design alternatives plus the alternatives addressed in the Hayden-Blue River Final EIS, issued by the Rural Electrification Administration in July, 1982. 24 figs., 14 tabs.

37779 (DOE/EIS—0125-F) Intertie development and use: Final environmental impact statement: Volume 2, Comments and responses. (Bonneville Power Administration, Portland, OR (USA)). Apr 1988. 230p. NTIS, PC A11;3. Order Number DE88011481/JAW.

This environmental impact statement examines the environmental effects of three proposed Bonneville Power Administration actions with respect to the use and development of the Pacific Northwest/Pacific Southwest Intertie. The actions are: expansion of the capacity of the Intertie; adoption of a Long-Term Intertie Access Policy (IAP), which will set the ground rules for use of the Intertie by utilities other than BPA for short and long-term transmission of surplus power to California; and decisions by BPA to enable, through its access policies and marketing efforts, various types and levels of firm power marketing between the Northwest and California. BPA is proposing these actions in order to make possible additional short and long-term sales of Federal power surplus to that needed for serving Northwest loads and to increase the ability to deliver surplus power when the surplus is most valuable to the importing region. Additionally, the actions are needed to increase economic efficiency, to support environmental quality goals, and to enhance the ability of BPA to repay its US Treasury investment in a timely fashion while maintaining reasonable power rates for its wholesale customers in the Northwest. There is a need for an equitable procedure to allocate access to Intertie capacity that is excess to what BPA requires for its own use and to provide opportunities for assured access to make possible long-term firm power transactions by utilities other than BPA. Volume 2 contains public comments to the proposed actions.

37780 (DOE/EIS—0125-F) Intertie development and use: Final environmental impact statement: Volume 3, Comment letters. (Bonneville Power Administration, Portland, OR (USA)). Apr 1988. 1125p. NTIS, PC A99;3. Order Number DE88011479/JAW.

The Intertie Development and Use (IDU) Final Environmental Impact Statement (EIS) examines the environmental effects of three proposed Bonneville Power Administration (BPA) actions with respect to the use and development of the Pacific Northwest/Pacific Southeast intertie; adoption of a Long-Term Intertie Access Policy (IAP), which will set the ground rules for use of the Intertie by utilities other than BPA for short-and-long transmission of surplus power to California; and decisions by BPA to enable, through its access policies and marketing efforts, various types and levels of firm power marketing between the Northwest and California. Volume 3 contains letters reacting to the draft environmental impact statement.

37781 (DOE/ID—12584-20) Background concentrations of selected elements in unconsolidated surficial materials at the US Department of Energy, Kansas City Facility. Fleischhauer, H.L. (UNC Geotech, Grand Junction, CO (USA)). Feb 1988. Contract AC07-86ID12584. 88p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010902/JAW.

A comprehensive hydrogeologic site characterization is being conducted at the US Department of Energy Facility in Kansas City, Missouri. The investigation was prompted initially by the discovery of volatile organic compounds in groundwater at the Tank Farm, an area where a number of underground storage tanks are located. The study has expanded to include other areas of the Facility such as landfills, surface inpoundments, spill sites, and storm sewer systems. The site characterization will characterize the site geology; define and model the groundwater flow to predict migration of contaminants; and define the extent of soil contamination in areas of known spills, leaks, and landfills. Contamination in surface soils was initially investigated in a reconnaissance survey conducted in 1984. Background concentrations of eight elements were estimated from the results obtained in this survey (Korte and others, 1985). As the site characterization has progressed, a considerable number of inorganic analyses have been performed on soils and other unconsolidated material collected at various sites on the facility. To date, 273 samples have been collected and more than 2000 analytical determinations have been performed for a suite of 10 elements. These elements are arsenic, beryllium, cadmium, chromium, copper, lead, manganese, mercury, nickel, and zinc. 41 refs., 18 figs., 31 tabs.

37782 (DP—1739-6) Comprehensive Cooling Water Study: Volume 6, Federally endangered species, Savannah River Plant: Final report. Mackey, H.E. (ed.). (Savannah River Lab., Aiken, SC (USA)). Sep 1987. Contract AC09-76SR00001. 192p. NTIS, PC A10/MF A01;1; GPO Dep. Order Number DE88010406/JAW.

The Comprehensive Cooling Water Study (CCWS) was initiated in 1983 to evaluate the environmental effects of the intake and release of cooling water on the structure and function of aquatic ecosystems at the Savannah River Plant. The initial report described the results from the first year of the study. This document is the final report and concludes the program. The report comprises eight volumes. The Endangered Species Act requires that Federal agencies use their authorities to conduct programs for the conservation of endangered and threatened species and to ensure that agency actions do not jeopardize the continued existence of or result in the destruction or adverse modification of critical habitat of protected species. Those Federally endangered or threatened species that occur on the Savannah River Plant (SRP) include the American alligator, the red-cockaded woodpecker, the shortnose sturgeon, the wood stork, and the bald eagle. Of these species, the alligator, sturgeon, wood stork, and the bald eagle are likely to be affected directly and/or indirectly by the intake or release of cooling water at the SRP. 81 refs., 76 figs., 35 tabs.

37783 (EUR—10861) Advanced decision-oriented software for the management of hazardous substances. A survey of software and sources of information. Fedra, K.; Schneider, J.; Ditterich, K. (Commission of the European Communities, Luxembourg). 1987. 64p. Commission of the European Communities, Luxembourg.

This report is carried out together with IIASA's outreach activities project on dialoguing with decision-makers on the management of industrial risk. It is supported by Unesco's Man and the biosphere programme. The objective is to design and develop an integrated set of software tools, adapted even for non-technical users. The report is a state-of-the-art survey including: (i) categories of hazardous substances, (ii) lists of hazardous substances and the industries releasing this waste, (iii) institutions, regulations and directives, (iv) data bases and a collection of models, (v) methods for comprehensive assessments, etc. It is therefore aimed to provide tools for decision making, usable by those engaged in the management of the environment and of industrial products and residues.

37784 **(GAO/RCED—86-107) National parks: Emergency law enforcement expenditures at two recreation areas.** (General Accounting Office, Washington, DC (USA)). 1986. 8p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

The National Park Service is using congressionally approved funds from other approved budget areas for law enforcement activities. GAO is concerned that this funding approach works against efforts in the construction, land acquisition, and other Park Service appropriation areas from which the emergency law enforcement funds were obtained. This occurrence, at Gateway, New York, and Golden Gate, California, National Recreation Areas, is inconsistent with the Park Service's emergency law enforcement expenditure authority.

37785 **(ORNL/CSD/TM—226) Review of geographic processing techniques applicable to regional analysis.** Durfee, R.C. (Oak Ridge National Lab., TN (USA)). Feb 1988. Contract AC05-84OR21400. 131p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88010759/JAW.

Since the early 1970s regional environmental studies have been carried out at the Oak Ridge National Laboratory using computer-assisted techniques. This paper presents an overview of some of these past experiences and the capabilities developed at the Laboratory for processing, analyzing, and displaying geographic data. A variety of technologies have resulted such as computer cartography, image processing, spatial modeling, computer graphics, data base management, and geographic information systems. These tools have been used in a wide range of spatial applications involving facility siting, transportation routing, coal resource analysis, environmental impacts, terrain modeling, inventory development, demographic studies, water resource analyses, etc. The report discusses a number of topics dealing with geographic data bases and structures, software and processing techniques, hardware systems, models and analysis tools, data acquisition techniques, and graphical display methods. Numerous results from many different applications are shown to aid the reader interested in using geographic information systems for environmental analyses. 15 refs., 64 figs., 2 tabs.

37786 **(PB—88-195672/XAB) Alternative-treatment methods for hazardous wastes.** Dial, C.J. (Environmental Protection Agency, Cincinnati, OH (USA). Hazardous Waste Engineering Research Lab.). Apr 1988. 17p. (EPA—600/D-88/061). NTIS, PC A03/MF A01.

The five-year schedule for the minimization and restrictions on the disposal of hazardous wastes onto the land is described. Two major items are causing a shift in the way hazardous wastes are managed in the United States. Because of liability for hazardous wastes, companies are seeking that which will detoxify or destroy these wastes. Under the RCRA amendments, best demonstrated available technology (BDAT) is being determined for each waste stream and is considered here. A description of the types of wastes not readily treated by current technologies and some of the deficiencies of these technologies are covered. Technologies currently used in the Superfund Innovative Technology Evaluation (SITE) Program are described.

37787 **(PB—88-197595/XAB) Standards applicable to owners and operators of hazardous-waste treatment, storage, and disposal facilities under RCRA (Resource Conservation and Recovery Act), Subtitle C, Section 3004. Financial requirements: interim status standards (40 CFR 265, Subpart H) (with addendum).** (Environmental Protection Agency, Washington, DC (USA). Office of Solid Waste). 1984. 185p. (EPA—530/SW-913). NTIS, PC A09/MF A01.

See also PB—81-189326; Portions of this document are not fully legible.

This guidance manual was developed to accompany the May 19, 1980 Subpart H cost estimating interim status regulations and their technical amendments. Since the manual was prepared, additional Subpart G regulations which affect the cost-estimating requirements were promulgated. Therefore, the manual does not necessarily reflect all the current requirements. The Agency is planning to update the manual to incorporate these additional requirements. In the meantime, however, an addendum included in the manual to clarify several points. The manual is intended to serve as a guide to the types of cost categories and documentation that are appropriate to include in a closure and post-closure care cost estimate. The sample estimates contained in the document illustrate the format and level of detail that would be acceptable to the U.S. Environmental Protection Agency.

37788 **(BNL—40980) Approaches for identifying, characterizing and managing risks from accidentally released toxic gases.** Moskowitz, P.D.; Fthenakis, V.M.; Morris, S.C.; Hamilton, L.D. (Brookhaven National Lab., Upton, NY (USA)). Oct 1987. Contract AC02-76CH00016. 18p. (CONF-8710301—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007752/JAW.

From Hazard assessment and control technology in semiconductor manufacturing meeting; Cincinnati, OH, USA (21 Oct 1987).

Accidental releases of toxic gases used by in semiconductor device and photovoltaic cell manufacturre and in other industries may present hazards to occupational or public health. Identification of consequences associated with such releases and characterization of accident-initiating events requires detailed and systematic evaluation. Many approaches are available to the semiconductor and photovoltaics industry to identify, characterize and manage risks from toxic gases. Application of these approaches may require simple data collection activities or complex evaluation efforts. The more complex efforts should only be initiated when screening efforts have shown that the activity of interest can present a significant hazard to life or property. Application of these approaches throughout the design and operation of these facilities, can improve plant safety. 16 refs., 3 figs., 2 tabs.

37789 **(AD-A—189968/1/XAB) Wetlands Research Program. Wetland Evaluation Technique (WET). Volume 2. Methodology. Operational draft report.** Adamus, P.R.; Clairain, E.J.; Smith, D.; Young, R.E. (Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab.). Oct 1987. 262p. NTIS, PC A12/MF A01.

This manual outlines a Wetland Evaluation Technique (WET) for the assessment of wetland functions and values. WET is a revision of the method developed for the Federal Highway administration (FHWA) that has often been referred to as the Federal Highway Method or the Adamus Method . Wetland functions are the physical, chemical, and biological characteristics of a wetland. WET evaluates the following functions and values: ground-water stabilization, sediment/toxicant retention, nutrient removal/transformation, production export, wildlife diversity/abundance, aquatic diversity/abundance, uniqueness/heritage, and recreation. WET evaluates functions and values in terms of social significance, effectiveness, and opportunity. Social significance assesses the value of a wetland to society in terms of its special designations, potential economic value, and strategic location. Effectiveness assesses the capability of a wetland to perform a function because of its physical, chemical, or biological characteristics. Opportunity assesses the opportunity of a wetland to perform a function to its level of capability. WET was designed primarily for conducting an initial, rapid assessment of wetland functions and values.

37790 (BR—82(11.80)) Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (North Atlantic): Sandworm and bloodworm. Wilson, W.H., Jr.; Ruff, R.E.; Moran, D. (Manomet Bird Observatory, MA (USA); Fish and Wildlife Service, Slidell, LA (USA); Corps of Engineers, Vicksburg, MS (USA). Waterways Experiment Station; Fish and Wildlife Service, Washington, DC (USA)). Apr 1988. 31p. (TR-EL—82-4). US Fish and Wildlife Service, 1010 Gause Blvd., Slidell, LA 70548. Order Number TI88010179/JAW.

Species profiles are literature summaries of the taxonomy, morphology, range, life history, and environmental requirements of coastal aquatic species. They are prepared to assist in environmental impact assessment. The sandworm (Nereis virens) is a commercially valuable baitworm, reaching lengths of 30 cm. Most worms live 4 or 5 years. Males swarm in the water column before spawning in the females' burrows. Both males and females die after spawning. A planktonic larval phase is either brief or lacking. Sandworms are omnivorous. They can significantly reduce the abundance of smaller infaunal organisms. Predators on sandworms include bloodworms and gulls. Physiological tolerances are broad although most worms are found in fine sand with water of high salinity. Sandworms have been the subject of much toxicological research and readily adapt to laboratory conditions. The bloodworm (Glycera dibranchiata), attaining lengths of 40 cm, is also an important baitworm. Its maximum life span is 5 years. Spawning occurs in the water column with both males and females dying after spawning. Bloodworms are primarily predators, preying on certain species of polychaetes and crustaceans, although they are capable of digesting detritus. Bloodworms appear to have few predators. Bloodworms possess at least two types of hemoglobin, permitting them to tolerate a wide range of oxygen tensions. 177 refs., 4 figs.

37791 (BR—82(11.81)) Species profiles: Life histories and environmental requirements of coastal fishes and invertebrates (Pacific Northwest): Chum salmon. Pauley, G.B.; Bowers, K.L.; Thomas, G.L. (Washington Univ., Seattle (USA). Cooperative Fishery Research Unit; Fish and Wildlife Service, Slidell, LA (USA). National Wetlands Research Center). Mar 1988. 17p. (TR-EL—82-4). US Fish and Wildlife Service, 1010 Gause Blvd., Slidell, LA 70458. Order Number TI88009313/JAW.

Chum salmon are anadromous fish found throughout a large part of the North Pacific Ocean and are the most widely distributed of all the Pacific salmon. Adults return to spawn in late summer and fall. Young fish migrate downstream quickly and rear in estuaries. Chum salmon mature later in life in more northerly water: in Alaska and British Columbia at age 4 to 5, in Washington and Oregon at age 3 to age 4. Fish from larger river systems grow to the largest size. The major commercial fishery is centered in Southeast Alaska and British Columbia. Harvest has increased in Washington to 1,150,000 fish annually due to increased hatchery production, with Hood Canal rivers accounting for 25% of all Washington fish. In odd-numbered years, the adult return-to-escapement ratio in any given river system is positively statistically correlated with increased spawning escapement of chum salmon relative to that of pink salmon.

37792 (CEA-CONF—9217) Oceanic tritium/helium pair analysis by mass spectrometry. Jean-Baptiste, P.; Andrie, C.; Lelu, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Physico-Chimie). 1987. 11p. (In French). (CONF-870627—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753453/JAW.

From International symposium on radioactivity and oceanography; Cherbourg, France (2 Jun 1987).

We describe the experimental procedure of the mass spectrometric measurements of the dissolved helium isotopes (^{3}He and ^{4}He) in seawater and the analytical method of the oceanic tritium determination by the β-regrowth technique. The experimental procedures and the analytical accuracies of each method are reported. Finally, the interest of the helium-3tritium pair is emphazised through the determination of a water mass age.

37793 (CEA-CONF—9218) Use of tritium and helium-3 for oceanographic processes study. An example: the Northeastern Atlantic Ocean. Andrie, C.; Merlivat, L. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Physico-Chimie). 1987. 12p. (CONF-870627—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88780088/JAW.

From International symposium on radioactivity and oceanography; Cherbourg, France (2 Jun 1987).

These results are relative to the TOPOGULF cruise during summer 1983. The sampled area is located near the Azores Islands on the both sides of the mid atlantic ridge. The tritium content of the surface waters reveals a strong front along the Azores current. At depth, the spatial distribution of tritium is studied along isopycnals. In the thermocline, it is essentially the anticyclonic gyre which is responsible for the northeast - southwest gradient in tritium concentration. Some informations about the age of the water masses are given by the use of both tritium and Helium-3. By this way are identified some areas where ventilation processes are active. At middepth, a strong contrast exists between the young waters originating from the Labrador Sea and the more stagnant waters in the South East of the sampled area.

37794 (DOE/NE—60570-1) Reduce uncertainty in projection of future sea-level changes due to ice wastage: Annual performance report. Meier, M.F.; Illangesakare, T.; Pfeffer, T.; Walter, R. Jr.; Kaufman, D. (Colorado Univ., Boulder (USA)). 1988. Contract FG02-87ER60570. 8p. NTIS, PC A02;3. Order Number DE88009883/JAW.

This is the first year of a three-year grant, and efforts during the first year were concentrated on literature search, preliminary investigation of the physics and developments of first-generation numerical models of the movement of water through cold snow, development of some necessary instrumentation, the first phase of a field experiment on the infiltration of water into cold snow in Arctic Canada, and the beginning of a field investigation on runoff processes in the marginal area of the Greenland Ice Sheet.

37795 (PB—88-190756/XAB) National Surface Water Survey, Western Lake Survey (Phase 1 - synoptic chemistry) quality assurance report. Silverstein, M.E.; Faber, M.L.; Drouse, S.K.; Mitchell-Hall, T.E. (Lockheed Engineering and Management Services Co., Inc., Las Vegas, NV (USA)). Nov 1987. 312p. NTIS, PC A14/MF A01.

See also PB—87-234928.

The quality-assurance program for the Western Lake Survey - Phase I was designed to ensure that the data collected were of known and acceptable quality. The quality-assurance program was based on similar activities conducted for the Eastern Lake Survey; - Phase I, and included the following major elements: selection of analytical laboratories, training of field sampling and field laboratory crews, on-site evaluation of field operations and analytical laboratories, daily communications with survey participants, and verification and evaluation of data collected. Quality assurance and quality control samples were used to identify, qualify, and quantify sources of sampling and analytical variability in terms of precision, accuracy, bias, and detectability. The relative importance of these sources of variation was assessed statistically.

37796 (PB—88-195359/XAB) Review of information bearing upon the conservation and protection of humpback whales in hawaii. Final report. Tinney, R.T. (Tinney (Richard T.), Jr., Arlington, VA (USA)). Mar 1988. 65p. NTIS, PC A04/MF A01.

See also PB—85-200772.

Humpback whales wintering in Hawaii may be affected by human activities in the nearshore waters apparently favored by the whales. The report reviews available information on the number, age/sex composition, reproductive status, distribution, movements, and essential habitats of the whales in Hawaii. It then identifies human activities that may be affecting the whales or their habitats and describes their nature, magnitude, and significance. This is followed by: a review of existing local, state, and Federal laws and regulations and their adequacy for avoiding or mitigating the effects of human activities on the whales; an identification of critical information gaps regarding the whales and the human activities.

37797 **(PB—88-863493/XAB) Microbiology of ground water. January 1978-April 1988 (Citations from the Life Sciences Collection data base). Report for January 1978-April 1988.** (National Technical Information Service, Springfield, VA (USA)). May 1988. 106p. NTIS PC N01/MF N01.

Supersedes PB—87-857892.

This bibliography contains citations concerning the occurrence, distribution, activity, and movement of ground-water microorganisms. Detection of microorganisms and their effects upon ground-water quality are also considered. (This updated bibliography contains 180 citations, 99 of which are new entries to the previous edition.)

37798 **(PNL-SA—15393) Reconnaissance survey of eight bays in Puget Sound.** Strand, J.A.; Crecelius, E.A.; Pearson, W.H.; Fellingham, G.W.; Elston, R.E. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 11p. (CONF-880374—2). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008186/JAW.

From 1. annual meeting on Puget Sound research; Seattle, WA, USA (18 Mar 1988).

From 1983 to 1985, Battelle/Marine Research Laboratory conducted reconnaissance-level field and laboratory studies to better characterize toxic contamination problems occurring in selected urban-industrialized bays (Bellingham Bay, Port Gardner - Everett Harbor, Fourmile Rock - Elliot Bay dump site vicinity, Sinclair Inlet) of Puget Sound. It was envisioned that this goal was best achieved by simultaneously determining levels of contamination in selected baseline or 'reference bays' (Samish Bay, Case Inlet, Dabob Bay, Sequim Bay). Two major tasks composed this effort. The first was conducted in 1983 and consisted of preliminary or screening surveys to collect and analyze sediment samples from 101 stations distributed in the four urban-industrialized bays (Figure 1), and at 80 stations distributed in the four baseline bays (Figure 2). The second task was undertaken in 1984 and involved detailed surveys and analyses of the same bays, but at a limited number of stations (32 in urban embayments, 16 in baseline bays). The stations to be resampled in 1984 were the "cleanest" of the clean and the "dirtiest" of the dirty as determined by the 1983 sediment chemical analyses, and within restrictions imposed by sediment type.

37799 **(AD-A—190073/7/XAB) Water-quality assessment of DOD installations/facilities in the Chesapeake Bay Region. Phase 3. Volume 1. Summary. Technical report, 1985-1987.** (Tetra Tech, Inc., Arlington, VA (USA)). Nov 1987. 109p. NTIS, PC A06/MF A01.

See also Volume 2, AD-A190 074.

This report represents the culmination of a two-year, three-phase effort to determine the relative impact of DOD activities on the water quality and living resource of the Chesapeake Bay. Phase I defined the recent historical and present pollution potential of all 66 DOD installations in the Bay's drainage basin, and developed a preliminary screening procedure to categorize these installations according to existing or potential impacts on the Bay and its tributaries. Phase II developed and tested a detailed assessment methodology on six installations to define the character and extent of their impact on the Bay. Phase III applied this test-bed methodology to the remaining 31 installations identified in Phase I as needing more-detailed assessment, and summarizes impacts and program recommendations from an installation, regional, and Bay-wide perspective. This volume presents summary information from this analysis.

37800 **(AD-A—190074/5/XAB) Water-quality assessment of DOD installations/facilities in the Chesapeake Bay Region. Phase 3. Volume 2. Overall approach, findings and recommendations. Technical report, 1985-1987.** (Tetra Tech, Inc., Arlington, VA (USA)). Nov 1987. 507p. NTIS, PC A22/MF A01.

See also Volume 1, AD-A190 073.

This report represents the culmination of a two-year, three-phase effort to determine the relative impact of DOD activities on the water quality and living resources of the Chesapeake Bay. Phase I defined the recent historical and present pollution potential of all 66 DOD installations in the Bay's drainage basin, and developed a preliminary screening procedure to categorize these installations according to existing or potential impacts on the Bay and its tributaries. Phase II developed and tested a detailed assessment methodology on six installations to define the character and extent of their impact on the Bay. Phase III applied this tested methodology to the remaining 31 installations identified in Phase I as needing more detailed assessment, and summarizes impacts and program recommendations from an installation, regional, and Bay-wide perspective. This volume presents detailed results of this analysis.

37801 **(AD-A—190376/4/XAB) Economic evaluation of air stripping to remove volatile organic compounds from water. Final report.** Zaghloul, H.H.; Ball, R.O.; Maloney, S.W. (Army Construction Engineering Research Lab., Champaign, IL (USA)). Dec 1987. 54p. (CERL-TR-N—87/23). NTIS, PC A04/MF A01.

This report documents the results of a study conducted to provide a basis for estimating the costs of installing and using air stripping to remove volatile organic compounds (VOCs) from water. The air-stripping technology was found to be a very economical and efficient method for contaminant removal. The technology is simple, relatively inexpensive to install, and has low labor and maintenance requirements. VOC removal rates range from 90 to 99.99%. Estimated costs, in terms of percentage of total production costs, were found to be 40% for capital costs, 50% for operational costs, and 10% for maintenance costs, according to literature sources. Results of a survey conducted during this study generally agree with these percentages, except that maintenance costs reported on the survey were lower due to the highly automated nature of new installations.

37802 **(AD-A—190441/6/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification, Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 1. Report text. Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 465p. NTIS, PC A20/MF A01.

See also Volume 2, AD-A190 442.

The Department of Defense's Installation Restoration Program (IRP) is a four-phase program to identify past waste disposal practices, evaluate the environmental impacts, propose mitigation measures, and remediate environmental problems. An IRP investigation is currently underway at AF Plant 4, Texas. Phase I, an initial assessment and records search to locate potential environmental problems associated with waste-disposal practices, was completed in 1984. Phase II, a field program to investigate potential environmental contamination, has been under way since 1985 under the direction of the U.S. Air Force Occupational and Environmental Health Laboratory (USAFOEHL). Radian Corporation of Austin, Texas, has performed Stage 1 of the Phase II investigation which is reported in this document.

37803 **(AD-A—190443/2/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 3. Appendix A-1 (continued). Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 549p. NTIS, PC A23/MF A01.

See also Volume 4, AD-A190 444.

This report contains data concerning water quality and environmental protection. This report was prepared for the United States Air Force by Radian Corporation, for the purpose of aiding in the implementation of the Air Force Installation Restoration Program.

37804 **(AD-A—190444/0/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 4. Appendix A-1 (continued). Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 603p. NTIS, PC A99/MF A01.

See also Volume 5, AD-A190 445.

This report discusses analytical data concerning environmental protection and water quality. This report was prepared for the United States Air Force by Radian Corporation, for the purpose of aiding in the implementation of the Air Force Installation Restoration Program.

37805 **(AD-A—190445/7/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 5. Appendix A-2. Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 517p. NTIS, PC A22/MF A01.

See also Volume 6, AD-A190 446.

This report contains information concerning environmental protection and water quality. Volume 5 and Volume 6 contain all quality/assurance quality control reports for water analyses (organized by work order number). Also included are summary tables (Tables A.2-1 through A.2-9) of the QC reports.

37806 **(AD-A—190446/5/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 6. Appendix A-2 (continued). Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 492p. NTIS, PC A21/MF A01.

See also Volume 7, AD-A190 447.

This document discusses data concerning environmental protection and water quality. This report was prepared for the United States Air Force by Radian Corporation, for the purpose of aiding in the implementation of the Air Force Installation Restoration Program.

37807 **(AD-A—190450/7/XAB) Installation Restoration Program. Phase 2. Confirmation/quantification. Stage 1. Air Force Plant 4, Fort Worth, Texas. Volume 10. Appendix I. Final report, September 1985-September 1986.** (Radian Corp., Austin, TX (USA)). Dec 1987. 620p. NTIS, PC A99/MF A01.

See also Volume 1, AD-A190 441.

This appendix includes analytical data from past and ongoing studies performed by Hargis & Associates for General Dynamics. The groundwater-quality data complied by Hargis & Associates, and used for comparison in the IRP Phase II Study, are listed below by the report from which they were obtained. Phase II Investigation of Subsurface Condition, U.S. Air Force Plant No. 4, Fort Worth, Texas (1985). Appendixes H-K Table 1; Water Quality Data, May 1985 through May 1986, U.S. Air Force Plant No. 4 Fort Worth, Texas (1986); Appendices C, D, E, and G. This report contains data concerning environmental protection.

37808 **(CONF-880679—3) The trade off between the complexity, input data and scale of application of the RAINS-lake model: A statistical analysis.** Hettelingh, J.P.; Gardner, R.H. (Oak Ridge National Lab., TN (USA); International Inst. for Applied Systems Analysis, Laxenburg (Austria)). 1988. Contract AC05-84OR21400. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010134/JAW.

From 81. annual meeting of Air Pollution Control Association; Dallas, TX, USA (1 Jun 1988).

To use a complex, process-oriented site model for predicting broad-scale environmental effects assumes (1) the availability of a large, quality data base for calibrating the model and (2) the validity of the process of extrapolating site-specific results to a larger region. The greater the level of extrapolation, the more error prone the model results may become. A simplified version of a complex process oriented RAINS Lake Model (RLM) was developed by regression methods to quantify these extrapolation errors. RLM variables that explain more than 1% of the variation in the model output (pH of 1980) were selected and calibrated to the measured pH distribution in 1980 in the southern region of Finland from 1920 to 1980. An iterative procedure was then used to select the minimum number of variables which best represented the behavior of the RLM. The results show that extreme regional characteristics may necessitate adaptation of a simplified model that has been calibrated in a less extreme regional context. 22 refs., 5 figs., 3 tabs.

37809 **(CONF-8806114—1) Microchemical analysis of fish hard parts for reconstructing habitat use: Practice and promise.** Coutant, C.C. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 19p. (CONF-8806114—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009055/JAW.

From International symposium and educational workshop on fish-marking techniques; Seattle, WA, USA (27 Jun 1988).

This paper describes and evaluates the application of several microscale chemical analysis techniques that allow the chemical record imbedded in daily and seasonal growth banding of biological skeletal materials to be used as an indicator of habitat history. Electron microprobe techniques offer the ability to scan many elements simultaneously but with low quantitative resolution; this technique has been applied to fish tissues by several investigators. Laser-based techniques, which were developed at Oak Ridge National Laboratory for use in the physical sciences, offer extremely high spatial and quantitative resolution for elements or isotopes, but the elements must be analyzed one at a time. They include several forms of resonance ionization spectroscopy and laser-induced fluorescence. Applications envisioned for fisheries research include differentiating freshwater, saltwater, and estuarine habitation of migratory striped bass; chemically marking hatchery-raised fish; and determining the exposure history of fish to water pollutants. 42 refs.

37810 **(EGG-M—10287) The effect of acidophilic heterotrophic bacteria on the leaching of cobalt by Thiobacillus ferrooxidans.** Wichlacz, P.L.; Thompson, D.L. (EG and G Idaho, Inc., Idaho Falls (USA)). 1987. Contract AC07-76ID01570. 10p. (CONF-8707155—1). NTIS, PC A02/MF A01; GPO Dep. Order Number TI88007731/JAW.

From International biohydrometallurgy symposium; Warwick, UK (13 Jul 1987).

Experiments were conducted to determine if acidophilic heterotrophic bacteria influence the ability of T. ferrooxidans to solubilize cobalt. Short term (7 day) flask leaching studies were conducted wherein 28 strains of T. ferrooxidans were each incubated with one of three different cobalt sulfides (CoS, cobaltite flotation concentrate, or cobaltite ore), with and without ferrous iron and/or heterotrophic bacteria. Growth of T. ferrooxidans was determined by comparing cobalt solubilization and ferrous iron oxidation for inoculated and uninoculated control flasks. Under all conditions tested, except one, the addition of acidophilic heterotrophs was found to enhance the extent of cobalt leaching. Longer term (28 day) studies were conducted which included the addition of glucose as a controlled variable. The presence of heterotrophs enhanced the leaching of CoS by T. ferrooxidans under all conditions. Cobalt leaching from concentrate and high grade ore by T. ferrooxidans was enhanced by the addition of heterotrophs in all cases except when ferrous iron or glucose were absent from the leaching medium. The present studies indicate that cobalt solubilization is substrate and strain dependent and, in most cases, is increased when acidophilic heterotrophic bacteria are present. 13 refs., 3 tabs.

37811 **(EPRI-EA—5816) Evaluation of tracer sampling devices for the macrodispersion experiment.** Boggs, J.M.; Hemond, H.F. (Tennessee Valley Authority, Norris (USA). Office of Natural Resources and Economic Development; Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Civil Engineering). May 1988. 91p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010688/JAW.

This report describes development and testing of multilevel sampling wells for the Macrodispersion Experiment (MADE). The objective was to assure that the wells used in the experiment provide representative groundwater tracer samples from discrete zones within the aquifer. Local tracer tests were conducted on several wells of different design to directly measure groundwater movement in the immediate vicinity of the sampling ports. Tests were

carried out to examine changes in natural groundwater flow patterns resulting from well installation and to evaluate interference between ports during sampling. Results indicated that an auger-installed multilevel sampler with external bentonite packers between sampling ports (AMLS-P) performed best. A drivable nultilevel sampler (DMLS) indicated about the same level of performance with respect to sampling port interference but showed evidence of changes in local groundwater movement in approximately half of the tests. The AMLS-P and DMLS were subsequently evaluated using tracer concentration and hydraulic head measurements during the first four months of the large-scale field tracer experiment. The AMLS-P and DMLS exhibited similar plume sampling and hydraulic head measurments. The AMLS-P was selected for future additions to the tracer sampling network because of its lower cost and better results for the local tracer tests. 9 refs., 21 figs., 4 tabs.

37812 **(GAO/RCED—87-170) Hazardous waste: Controls over injection well disposal operations.** (General Accounting Office, Washington, DC (USA). Resources, Community and Economic Development Div.). 1987. 52p. US General Accounting Office, PO Box 6015, Gaithersburg, MD 20877.

There have been few confirmed cases of drinking-water contamination from hazardous waste injection wells. However, because the contamination is hard to detect, it cannot be said with certainty that no other cases exist. Neither the Environmental Protection Agency nor the states require that groundwater immediately above injected waste be sampled and tested for contamination. In monitoring 21 wells in 2 states for which EPA has direct oversight responsibility, GAO found that the agency did not perform the required periodic inspections during FY 1985 and 1986. Effective in August 1988, underground hazardous waste injection will be banned except where it can be shown that the waste can be fully contained within the injection zone and will not spread into unintended areas; the burden of proof will fall on the well operator. EPA expects that, with few exception, wells operating today will be able to meet this test and will, therefore, continue to inject hazardous waste underground.

37813 **(GKSS—87/E/40) Results of mapping a groyne-field of the Elbe river near Schnakenbek.** Wilken, R.D.; Posske, G. (GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.)). 1987. 7p. (In German). Special print from Dtsch. Gewaesserkd. Mitt. (1987) v. 31(2/3) p. 77-81.

In a groyne-field of the Elbe river near Schnakenbek, at Elbe-km 575,3, measurements on sediment load and sediment distribution were conducted in September-October 1985. In some places of this zone a sediment thickness of more than 1,90 m was measured. (Discharge at that time: about 400 m^3s, average discharge: 751 m^3s). The total sediment load in the field was estimated at 5,700 m^3, corresponding to 6,000 tons (wet weight). If in other groyne-fields of the Elbe upstream of the Geesthacht weir similar conditions prevailed, an influence of the meanwhile deposited material on the suspended sediment transport could not be excluded. In consideration of contaminated dredged material this effect might be of importance for the sediment process in the Hamburg Harbour.

37814 **(IVL-B—846) Liming project Haerskogen 1976-1986. Water chemical and biologic response on liming in seven Westswedish lakes.** Alenaes, I. (Swedish Environmental Research Inst., Stockholm). 18 Dec 1986. 60p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752912/JAW.

This report describes a liming project where 2000 tons of limestone were spread in seven lakes at the Swedish westcoast. Six different limestone products and six different application techniques were tested. The overall results are very positive, though acid surges were documented. 50-95% of the applied limestone were dissolved during 1977-85. Fish reproduction improved and benthic invertebrates showed long-term expansion within and between lakes; valuable knowledge to be used in future designing of biologically applied liming strategies.

37815 **(LBL—24250) Hydrological, geochemical, and ecological characterization of Kesterson Reservoir: Annual report, October 1, 1986 through September 30, 1987.** (Lawrence Berkeley Lab., CA (USA)). Dec 1987. Contract AC03-76SF00098. 193p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88008424/JAW.

Over the past two years scientists and engineers at Lawrence Berkeley Laboratory (LBL) and the Sanitary Engineering and Environmental Health Research Laboratory (SEEHRL) have investigated the effects of selenium contamination at Kesterson Reservoir. Selenium was present in food chain items at levels potentially toxic to birds by 1983. Although selenium concentrations have decreased in food chain items since drainage water inflow to the Reservoir ceased in 1986, selenium concentrations remain unacceptably high. Degradation of local groundwater resources, both from selenium contamination and accumulation of salts in near surface soils is also of concern. This report summarizes the results of a multidisciplinary program of research and monitoring activities aimed at providing a technical basis for choosing the best method for remediation of Kesterson Reservoir. 79 refs., 65 figs., 24 tabs.

37816 **(NIVA-E—87700/I) Sources, occurrence and effects of polycyclic aromatic hydrocarbons (PAH) in the aquatic environment - a preliminary review.** Knutzen, J. (Norsk Inst. for Vannforskning, Oslo). Apr 1987. 22p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752845/JAW.

Based on previous and more comprehensive reviews, applied with selected results from later work, the report intends to sum up in a concise way that part of today's knowledge about PAH which is assumed to be of most interest in relation to water resources management. 1 table, 35 references.

37817 **(NIVA-E—87700/II) Some observations of effects from polycyclic aromatic hydrocarbons (PAH) and fluoride in Norwegian marine recipients of aluminium smelter waste.** Knutzen, J. (Norsk Inst. for Vannforskning, Oslo). May 1987. 29p. NTIS (US Sales Only), PC A03. Order Number DE88752846/JAW.

Observations in Norwegian marine recipients of aluminium smelter waste have only shown marked ecological effects in the near zone (< 1 km) of scrubber effluents or in the vicinity of deposits rich in PAH and fluoride. However, 1-3 orders of magnitude excess concentrations of PAH in mussels, snails and seaweeds have been observed at distances more than 20 km from the sources, thus imposing restrictions on aquaculture in a considerable fjord area. Fluoride concentrations about 5 times the /sup n/ormal/sup /level have been observed in seaweeds exposed to less than the double natural fluoride content of water. No significant contamination was recorded in limpets. 10 drawings, 4 tables, 31 references.

37818 **(ORNL/TM—10682) Laboratory studies of methods for the treatment and disposal of the waste stream from the silver-recovery facility at Oak Ridge National Laboratory.** Parrott, J.R. Jr.; Strandberg, G.W. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011703/JAW.

Studies have shown that the waste stream, resulting from the process used to recover silver from spent photographic solutions at the Department of Energy's Oak Ridge National Laboratory (ORNL) and Y-12 Plant facilities can be disposed of via ORNL's sewage treatment plant. The results of laboratory studies of alternative treatment methods are discussed. 3 refs., 3 tabs.

37819 **(PB—88-180310/XAB) Importance of hydrogen ions and aluminium in regulating the structure and function of stream ecosystems: an experimental test.** Hall, R.J.; Driscoll, C.T.; Likens, G.E. (Environmental Protection Agency, Duluth, MN (USA). Environmental Research Lab.). 1987. 29p. (EPA—600/J-87/264). NTIS, PC A03/MF A01.

Pub. in Freshwater Biology 18, 17-43(Aug 1987).

Experiments simulating spring acidic snowmelt episodes were conducted to determine the effects of short-term inputs of H^+ and Al on the chemistry and biology of a poorly buffered mountain

stream. HCl and $AlCl_3$ were added in separate experiments to first- to third-order reaches of a New Hampshire stream. Some aspects of the study addressed cation exchange, foam production at the water surface, total phosphorus measurements, drift of mayfly nymphs, blackfly and chironomid larvae and stream pH.

37820 **(PB—88-181813/XAB) Fate and effects of dispersed and non-dispersed oil in Arctic mud flats.** Sveum, P. (SINTEF, Trondheim (Norway)). 29 Dec 1987. 24p. (STF—21-A87119). NTIS, PC E03/MF E03.

Dispersants have been mostly applied after oil-pollution incidents on the sea. In some cases, however, the use of dispersants on the sea shore has been used to such an extent and with such harmful effects that a long-lasting bad reputation has been established. The main idea of the present experiments have been to evaluate how three different dispersants affects the biodegradation of oil, the physical removal of oil, and the sediment-living microfauna and flora of oil-contaminated mudflats on Spitsbergen.

37821 **(PB—88-183058/XAB) Aquatic cycling of selenium: implications for fish and wildlife.** Lemly, A.D.; Smith, G.J. (National Fisheries Contaminant Research Center, Columbia, MO (USA)). 1988. 15p. (FISH/WILDLIFE LEAFL—12). NTIS, PC A03/MF A01.

Library of Congress catalog card No. 87-600456.

Selenium, a non-metallic trace element, is readily accumulated by aquatic organisms. The degree of mobility or cycling rate of selenium in an aquatic ecosystem will largely determine whether toxicity occurs and how long the environmental hazard remains. The selenium cycle is made up of immobilization and mobilization processes that move the element between organisms, water, and sediment, with kinetics determined by chemical and physical factors related to the type of habitat present and its spatial variability. Because of its ability to bioaccumulate and cause adverse reproductive effects at low environmental concentrations, selenium should be recognized as a contaminant with the potential to severely impact fish and wildlife populations.

37822 **(PB—88-184882/XAB) Improved laboratory dispersant-effectiveness test. Final report.** Shum, J.S. (Mason and Hanger-Silas Mason Co., Inc., Leonardo, NJ (USA)). Mar 1988. 117p. NTIS, PC A06/MF A01.

The U.S. Environmental Protection Agency (EPA) initiated a program to evaluate an Improved Laboratory Dispersant Effectiveness Test (ILDET) developed to replace EPA's Revised Standard Dispersant Effectiveness Test (RSDET). The report summarizes the development of the ILDET. The improved test provides a method to evaluate dispersant effectiveness in a physically realistic condition. The test energy level is dynamically similar to the small-scale ocean turbulence responsible for droplet formation. A preliminary evaluation of the test was conducted to assess the various factors that may affect the precision of the test. The preliminary evaluation shows a possible improvement in precision over the existing EPA method.

37823 **(PB—88-185244/XAB) Controlling arsenic, fluoride, and uranium by point-of-use treatment.** Fox, K.R.; Sorg, T.J. (Environmental Protection Agency, Cincinnati, OH (USA). Water Engineering Research Lab.). 1987. 6p. (EPA—600/J-87/283). NTIS, PC A02/MF A01.

Pub. in Jnl. of American Water Works Association, Vol. 79, No. 10, 81-84(Oct 1987).

Arsenic and other inorganic contaminants are found in the water supplies of many small communities. One possible solution for the problem of inorganic contaminants is point-of-use treatment, which can be used by individual homes or small communities. Ion exchange, activated alumina, and reverse osmosis point-of-use treatment units have been evaluated by the U.S. Environmental Protection Agency, and each system was found to be effective under certain operating conditions. Data from various field projects are presented, along with laboratory data on the removal of specific contaminants.

37824 **(PB—88-186309/XAB) Summary of Maryland stream pH and alkalinity data: analysis of its application to assessing the impacts of acidic deposition. Final report.** Janicki, A.; Greening, H. (Versar, Inc., Columbia, MD (USA)). Sep 1987. 68p. NTIS, PC A04/MF A01.

See also PB—88-186317.

Stream-chemistry data were gathered from a number of sources to characterize the sensitivity of flowing waters in Maryland to acidification, as well as to provide baseline information for the design of a synoptic survey of stream chemistry conducted in 1987. Overall, 19% of Maryland streams, for which data were collected, exhibit mean alkalinity values of less than 200 micro eq/L, generally considered to be indicative of waters sensitive to acidification. Minimum alkalinity values less than 200 micro eq/l were found in 41% of the data sets examined. Mean pH values less than 6.0 were observed in about 9% of the streams for which data were identified. Minimum pH values less than 6.0 were observed in 24% of the streams.

37825 **(PB—88-195656/XAB) Environmental bibliography for northwest Florida 1900-1985.** McErlean, A.J.; Means, S.M. (Environmental Protection Agency, Gulf Breeze, FL (USA). Environmental Research Lab.). Apr 1988. 325p. (EPA—600/8-88/068). NTIS, PC A14/MF A01.

This bibliography attempts to identify, acquire, and index available literature resources that can be used for decision making and environmental research. It also includes a technical data base for studies related to the area from Cape San Blas, Florida to Baldwin County, Alabama.

37826 **(PB—88-863907/XAB) Toxicity bioassays: water-pollution effects on aquatic animals and plants. June 1986-May 1988 (Citations from the Selected Water Resources Abstracts data base). Report for June 1986-May 1988.** (National Technical Information Service, Springfield, VA (USA)). May 1988. 37p. NTIS PC N01/MF N01.

Supersedes PB—87-861100.

This bibliography contains citations concerning toxicity bioassay studies of water pollution effects on reproduction, growth, and mortality of aquatic animals and plants. Industrial and agricultural water pollutants such as metals, chemicals, pesticides, and herbicides are evaluated and tested. Standard fishes and algal assays are used to determine effects of potential toxicants. (This updated bibliography contains 62 citations, 12 of which are new entries to the previous edition.)

37827 **(PNL—6536) Ground-water monitoring compliance projects for Hanford Site facilities: Progress report, October 1-December 31, 1987.** (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 92p. NTIS, PC A05;3. Order Number DE88010687/JAW.

This report documents the progress of four Hanford Site ground-water monitoring projects for the period from October 1 to December 31, 1987. The four disposal facilities are the 300 Area Process Trenches, 183-H Solar Evaporation Basins, 200 Areas Low-Level Burial Grounds, and Nonradioactive Dangerous Waste (NRDW) Landfill. The four ground-water monitoring projects discussed in this report have been designed according to the applicable ground-water monitoring requirements specified in the Resource Conservation and Recovery Act, and in Washington Administrative Code 173-303. During this reporting period, field activities consisted of completing repairs on two monitoring wells around the 183-H Basins and completing construction of the last 10 of 35 monitoring wells around the 200 Areas Burial Grounds. These wells were completed by November 30, 1987, in compliance with the above-referenced Compliance Order. Pretest hazardous chemical analyses of ground-water samples and aquifer tests were conducted in the 200 Area wells, where possible. The data are presented in this report. Analytical results for the 300 Area, 183-H, and the NRDW Landfill indicate no deviations from the established trends reported in previous progress reports. 13 refs., 15 figs., 12 tabs.

37828 (RISO-M—2630, pp 38-40) **Effect of ozone, nitrogen oxides and metal cations on polycyclic aromatic hydrocarbons.** Tuominen, J. (Technical Research Centre of Finland, Food Research Laboratory, Biologink. 1, Espoo (FI)). Jan 1988. NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752926/JAW. (CONF-8709266—).

From 6. workshop of the working party 2 "chemical and photochemical reactions" of the concerted action "physico-chemical behaviour of atmospheric pollutants"; Roskilde, Denmark (17 Sep 1987).

37829 **Kinetics of chromium(II) oxidation to chromium(VI) by reaction with manganese dioxide.** Eary, L.E.; Rai, D. (Battelle, Pacific Northwest Labs., Richland, WA (USA)). *Environmental Science and Technology;* **21**: No. 12, 1187-1193(Dec 1987).

The kinetics of oxidation of aqueous Cr(III) to Cr(VI) by reaction with pyrolusite [β-MnO_2(s)] were studied in aerated and deaerated solutions at 27°C for pH 3.0-10.1, for 10/sup -4.7/-10/sup -3.4/ M Cr(III), and as a function of β-MnO_2(s) surface area to assess the possible effects on Cr transport in industrial waste materials. The oxidation of aqueous Cr(III) is not appreciably affected by dissolved oxygen, indicating that Cr(III) reacts directly with β-MnO_2(s) to produce Cr(VI) and not by catalyzed reactions with oxygen at the β-MnO_2(s) surface. In acidic solutions, the oxidation of aqueous Cr(III) is highly nonlinear with time, possibly because strong adsorption of the produced anionic Cr(VI) species limits the amount of Cr(III) species able to contact active oxidizing sites on the β-MnO_2(s) surface. The following expression is derived from the rate data for pH 3.0-4.7 that empirically account for the nonlinear rate by describing the reaction rate in terms of the fraction of Cr(VI) to total Cr, f/sub Cr/, remaining in solution: df/sub Cr/dt (s^{-1}) = k(AV)[Cr/sub t/]$^{-1}$(1.0 - f/sub Cr/)/sup 3.2 (+/- 0.8) for f/sub Cr/ $\leq$ 1.0 where k = 2.0 (+- 1.6) x 10^{-2} mol x m^{-2} x s^{-1}, AV is the β-MnO_2(s) surface area to solution volume ratio in m^2 x L^{-1}, and [Cr/sub t/] is the molar concentration of total dissolved Cr. In slightly acidic to basic solutions, the oxidation of aqueous Cr(III) is very slow and is limited by the low solubility of $Cr(OH)_3$(s). 19 references, 6 figures, 4 tables.

37830 (DOE/AL/10752—39) **Chemical and radiochemical characteristics of groundwater in the Culebra Dolomite, southeastern New Mexico.** Chapmen, J.B. (New Mexico Health and Environment Dept., Santa Fe (USA). Environmental Evaluation Group). Mar 1988. Contract AC04-78AL10752. 65p. (EEG—39). NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88008123/JAW.

The nation's first geologic repository for radioactive waste is being excavated in southeastern New Mexico at the Waste Isolation Pilot Plant (WIPP). Post-closure radioactive release scenarios from WIPP often involve hydrologic transport of radionuclides through the overlying Rustler Formation, in the Culebra Dolomite Member. The Environmental Evaluation Group (EEG) has conducted an investigation of the chemistry of culebra groundwater. Analysis revealed the following: salinities in Culebra groundwater generally increase from west to east; a Na-Cl type water dominates over most of the sampled area with a Ca-SO_4 type occurring in the southern to southwestern area; exclusive of the low-salinity southern area, most wells located on the same general flow path have similar ion ratios; dissolved uranium content in Culebra groundwater is relatively high, with marked disequilibrium between U-238 and U-234 activities; Ra-226 and Ra-228 are sometimes present in relatively large amounts; Th-228 was detected in samples from 5 wells; and Cs-137 was detected in several samples. 39 refs., 21 figs., 2 tabs.

37831 (DOE-RW—88,031) **Modelling the interactions between radionuclides and particles in the ocean for assessments of sea disposal of radioactive waste.** Delow, C.E.; Mobbs, S.F. (National Radiological Protection Board, Chilton (UK)). (Department of the Environment, London (UK)). Jan 1988. 80p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753987/JAW.

This report describes work connected with the combined ocean dispersion and sedimentation model developed by MAFF/NRPB. Firstly, the ability of the model to reproduce the observed profiles of nine naturally occurring tracers was studied. Secondly, a number of sensitivity analyses on the sedimentation component of the model were performed. Thirdly, the effect of variations in bioturbation rate and of the inclusions of turbiditic sedimentation or coastal scavenging were studied. The results are used to draw conclusions on the adequacy of the model.

37832 (DOE-RW—88,036) **UK Natural Analogue Co-Ordinating Group: first annual report.** Hooker, P.J.; Chapman, N.A. (eds.). (British Geological Survey, Keyworth. Fluid Processes Research Group). (Department of the Environment, London (UK)). Nov 1987. 40p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753988/JAW.

The British Geological Survey is reponsible for co-ordinating the Department of the Environment's programme of natural analogue studies of radionuclide migration, a research programme that involved both UK and overseas sites. Co-ordination is achieved through the UK Natural Analogue Co-ordinating Group (NACG) which was established in October 1986. It has met three times to date and its function is to ensure that the different research projects have an integrated purpose aimed at improving and applying our understanding of natural geochemical processes in a way that will increase our confidence in long-term modelling predictions. Improved modelling prediction of radionuclide transport in the geosphere will directly benefit the performance and safety assessments of proposed radioactive waste repositories.

37833 (DP—1739-1) **Comprehensive cooling water study: Volume 1, Summary of environmental effects, Savannah River Plant: Final report.** Halverson, N.V. (ed.); Gladden, J.B.; Lower, M.W.; Mackey, H.E. Jr.; Specht, W.L.; Wilde, E.W. (Savannah River Lab., Aiken, SC (USA)). Oct 1987. Contract AC09-76SR00001. 91p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010377/JAW.

The Comprehensive Cooling Water Study (CCWS) was initiated in 1983 to evaluate the environmental effects of the intake and release of cooling water on the structure and function of aquatic ecosystems at the Savannah River Plant. The initial report (Gladden et al., 1985) described the results from the first year of the study. This document is the final report and concludes the program. The report comprises eight volumes. Volume I is a summary of environmental effects. 60 refs., 13 figs.

37834 (DP—1739-3) **Comprehensive Cooling Water Study: Volume 3, Radionuclide and heavy metal transport, Savannah River Plant: Final report.** Lower, M.W. (ed.). (Savannah River Lab., Aiken, SC (USA)). Oct 1987. Contract AC09-76SR00001. 362p. NTIS, PC A12/MF A01;1; GPO Dep. Order Number DE88010405/JAW.

The Comprehensive Cooling Water Study (CCWS) was initiated in 1983 to evaluate the environmental effects of the intake and release of cooling water on the structure and function of aquatic ecosystems at the Savannah River Plant (SRP). The initial report described the results from the first year of the study. This document is the final report and concludes the program. The report comprises eight volumes. Volume III, the Radionuclide and Heavy Metal Transport Program of the Comprehensive Cooling Water Study, was designed to assess the distribution and transport of radionuclides and heavy metals in onsite stream and Savannah River floodplains. The conclusion that SRP cooling water discharges are not having significant offsite radiological impacts is verified by: (1) routine radiochemical data collected from Savannah River water and sediment analysis programs; (2) radionuclide data collected from raw and finished water and holding pond sediment analyses

from downriver treatment plant facilities; and (3) calculated dose to man estimates of the maximum population and individual radioactive uptake resulting from consumption of finished water from the downriver treatment facilities. 58 refs., 56 figs., 134 tabs.

37835 **(INIS-BR—1025) Introduction and optimization of methods for isotopic determination of thorium and uranium via α-spectroscopy and their applications in analysis of water from Morro do Ferro, Brazil.** Vale, M.G.R. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Quimica). 1982. 119p. (In Portuguese). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88702290/JAW.

Methods for isotopic determination of thorium and uranium via α-spectroscopy, using a surface barrier detector, are described. The methods were applied in surface waters, borehole water, sediments and minerals from Morro do Ferro (MG), Brazil. Results and analysis by different techniques are compared and some discussions concerning to Th-concentration levels and anomalous isotopic and nuclidic ratios are presented.

37836 **(INIS-BR—1034) Thorium - humic compound interaction in the water of Morro do Ferro (Pocos de Caldas, MG, Brazil).** Kuechler, I.L. (Pontificia Univ. Catolica do Rio de Janeiro (Brazil). Dept. de Quimica). 1986. 170p. (In Portuguese). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702298/JAW.

Experimental procedures and results are presented on the determination of thorium and organic dissolved carbon (DOC) in natural waters (bore hole and surface waters) from the Morro de Ferro, a thorium - rare earth occurrence situated in the Pocos de Caldas Plateau in Minas Gerais (Brazil). A positive correlation between Th-232 and humic compounds content was observed. Utilizing ultrafiltration techniques with Amicon membranes (XM-300, PM-10, UM-10 and YM-2), organic compounds with molecular weights above 1000 units were separated and concentrated from waters. Percolation waters rich in organic material concentrate DOC and Th-232 in the high molecular weight fractions (> 10.000 MW units). Humic acid was separated from a percolation water sample and characterized by elemental and infrared spectroscopic analysis. The distribution coefficient of Th-232 between water and sediment was shown to be inversely correlated to DOC concentration, as reported by other authors for different environments. These results were also confirmed by laboratory experiments, which indicated additionally that low concentrations of humic acid (< 5 mg/l) are insufficient for maintaining thorium in solution. All analysed waters showed humic compounds in the ultrafiltrates; However, in ground waters the content of humic and fulvic acids is generally too low to influence significantly thorium solubility.

37837 **(NSS/R—111) Evolution of the groundwater chemistry around a nuclear waste repository.** Haworth, A.; Sharland, S.M.; Tasker, P.W.; Tweed, C.J. (United Kingdom Nirex, Ltd.). Dec 1987. 13p. (CONF-8711100—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753613/JAW.

From Symposium on the scientific basis for nuclear waste management; Boston, MA, USA (30 Nov 1987).

Some of the necessary techniques to construct a research model of the evolution of the groundwater under the influence of the backfill material in a nuclear waste repository are developed. These involve various extensions to the coupled ionic migration and chemical equilibria code, CHEQMATE. These extensions have been used in the first stages of a model of the chemical environment within the host rock. In this preliminary model we have considered a concrete backfill material embedded in a clay geology. However, the model is sufficiently flexible that other backfill materials and host rocks may be considered if a good thermodynamical description is available. The preliminary results from the model suggest that over timescales of about a thousand years the natural buffering action of the clay against changes in pH has a significant effect on the scale of perturbation by the ingress of highly alkaline porewater. It seems likely therefore that this type of modelling will have considerable relevance to the safety assessment models.

37838 **(SKI—85062) Implementation and integration of program packages NAMMU and HYPAC.** Nedbal, T. (Swedish Nuclear Power Inspectorate, Stockholm). May 1986. 45p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752500/JAW.

This work is prepared for the Swedish Power Inspectorate (SKI). The SKI has from the Atomic Energy Research Establishment (AERE) at Harwell, U.K., acquired the computer model NAMMU for groundwater hydrology calculations. The code was first implemented on an AMDAHL 470, a IBM compatible computer, and then modified in order to integrate it with HYPAC, which is a program package for pre- and post-processing finite element data, developed by KEMAKTA AB. This report describes the modifications done to both NAMMU and HYPAC, and the verification of the coupled program system NAMMU-HYPAC.

37839 **Human exposure to volatile organic compounds in household tap water: the indoor inhalation pathway.** McKone, T.E. (Lawrence Livermore National Lab., CA (USA)). *Environmental Science and Technology;* **21**: No. 12, 1194-1200(Dec 1987). Contract W-7405-ENG-48.

This paper addresses the quantification of human exposure to volatile organic compounds (VOC's) as a result of mass transfer from tap water to indoor air. A three-compartment model is developed and used to simulate the 24-h concentration profile within the shower, bathroom, and remaining household volumes of a dwelling. Mass transfers from water to air are derived from measured data for radon and adjusted to account for the difference in mass-transfer properties for VOC's. A preliminary data base for household parameters is used to calculate a range of concentrations and human exposures in U.S. dwellings. The model is used to estimate exposure factors for seven compounds-chloroform, ethylene dibromide, dibromo-chloropropane, methylchloroform, perchloroethylene, trichloroethylene, and carbon tetrachloride. The calculated ratio of indoor-air exposure to tap water concentration is compared to measured values for one of the compounds, chloroform. A sensitivity analysis is used to identify important parameters. 21 references, 3 figures, 8 tables.

REFER ALSO TO CITATION(S) 37728, 37729, 37784, 37785, 37815, 37827, 37840, 37852, 38005

37842 (BNL—41147) The Washington, D.C. experiment. Patrinos, A.A.N.; Leach, M.J.; Binkowski, F.S. (Brookhaven National Lab., Upton, NY (USA); Environmental Protection Agency, Research Triangle Park, NC (USA)). 1988. Contract AC02-76CH00016. 8p. (CONF-880595—1). NTIS, PC A02;3. Order Number DE88009159/JAW.

From NAPAP atmospheric transport and modeling research program review meeting; Richmond, VA, USA (1 May 1988).

A representative sample of wintertime storms was sampled during the Washington Experiment. Although a clear upwind-downwind delineation was not possible for all storms, the sequential data in one case detected the veering of the urban plume. The analysis of the data is continuing and several diagnostic modeling calculations are pending. Consequently, this discussion is preliminary. Some of the conclusions are: (1) In general, the Washington Experiment replicates the results of the Philadelphia field studies. Urban emissions have a significant impact on the wet deposition of nitrate on the mesoscale with increases approaching 100% above regional background. The impact on sulfate deposition is not as large. Estimates of excess deposition amounts as fractions of total emissions are pending. (2) Similarities in the Philadelphia and Washington results implicate the transportation emissions in the deposition of excess nitrate. This is based on the absence of significant industrial activity in the Washington area. (3) Mesoscale circulations, induced by the complex topography in the area, can promote sharp variations in the air masses across the Washington-Baltimore corridor. These variations may include vertical gradients in oxidant concentrations and seriously affect ground-level acid deposition. 7 refs., 6 figs.

37843 (DP—1739-5) Comprehensive Cooling Water Study: Volume 5, Aquatic ecology, Savannah River Plant: Final report. Specht, W.L. (ed.). (Savannah River Lab., Aiken, SC (USA)). Oct 1987. Contract AC09-76SR00001. 567p. NTIS, PC A99/MF A01;1; GPO Dep. Order Number DE88010404/JAW.

The Comprehensive Cooling Water Study (CCWS) was initiated in 1983 to evaluate the environmental effects of the intake and release of cooling water on the structure and function of aquatic ecosystems at the Savannah River Plant. The initial report (Gladden et al., 1985) described the results from the first year of the study. This document is the final report and concludes the program. The report comprises eight volumes. The first is a summary of environmental effects. The other seven volumes address water quality, radionuclide and heavy metal transport, wetlands, aquatic ecology, Federally endangered species, ecology of Par Pond, and waterfowl. This report documents the results of the Aquatic Ecology Program of the Comprehensive Cooling Water Study. The purpose of the Aquatic Ecology Program was to determine the environmental impacts of cooling water intake and release on the biological communities of SRP streams and swamps and the Savannah River, and the significance of these impacts on the SRP environment. 171 refs., 132 figs., 165 tabs.

37844 (DP-MS—88-43) N:P ratios and physiological indicators of nutrient limitation in a southeastern reservoir. Tilly, L.J.; Chimney, M.J.; Newman, M.C. (EG and G Idaho, Inc., Idaho Falls (USA)). 1988. Contract AC09-76SR00001. 13p. (CONF-8806135—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011550/JAW.

From Annual meeting of the American Society of Limnology and Oceanography; Boulder, CO, USA (12 Jun 1988).

Cooling water flow dominates the nutrient and phytoplankton dynamics of L-Lake, a reservoir receiving effluent from a nuclear reactor. Available N:P ratios shift relative to those of the source water (Savannah River) during the cooling process. Examination of N:P ratios suggested that N is limiting during times of cold flow, but P is limiting during thermal conditions. Laboratory biostimulation assays using Selenastrum capricornutatum and hot reactor effluent indicated that both N and P additions enhanced algal productivity. Changes in nutrient concentrations in epilimnetic waters, as the water mass moved downlake, suggested that N limitation was experienced by the phytoplankton. In situ microcosm enrichment studies clearly indicated that inorganic N limited algal growth. Both NH_3 and NO_3 additions were readily assimilated in a manner conforming to Michaelis-Menton kinetics. Algal growth and ortho-phosphate assimilation was slow in microcosms receiving ortho-phosphate additions only.

37845 (PB—88-863394/XAB) Lake restoration. January 1977-May 1988 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1988. (National Technical Information Service, Springfield, VA (USA)). May 1988. 149p. NTIS PC N01/MF N01.

Supersedes PB—87-860938.

This bibliography contains citations concerning the economic aspects and environmental effects of lake restoration/rehabilitation. Topics include aeration/circulation, dilution/flushing, sediment removal/dredging, and neutralizing materials to reduce acidification of lakes. Eutrophication conditions and solutions are also discussed. (This updated bibliography contains 249 citations, 23 of which are new entries to the previous edition.)

37846 (SREL—24) Wood Storks of the Savannah River Plant: Foraging and breeding ecology: Comprehensive cooling water study final report. Coulter, M.C. (Savannah River Ecology Lab., Aiken, SC (USA)). Jun 1986. Contract AC09-76SR00819. 135p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88010877/JAW.

This report presents the results of studies from 1983 through 1985 that deal with the use of the Savannah River Swamp System (SRSS) by Wood Storks. We examine the locations on the SRSS where storks have been observed foraging on the SRSS, and the time of year when birds were seen in the swamp. We compare measurements of habitat characteristics, water quality, vegetation and prey density at foraging sites on the SRSS with similar measurements at other foraging sites in east-central Georgia. Finally, we examine food demand of storks breeding at the Birdsville colony as an indication of the time of year when the birds would be most in need of food.

37847 (SREL—31) Wood Storks of the Birdsville Colony and swamps of the Savannah River Plant: 1986 annual report. Coulter, M.C. (Savannah River Lab., Aiken, SC (USA)). Apr 1987. Contract AC09-76SR00819. 263p. NTIS, PC A12/MF A01;1; GPO Dep. Order Number DE88010878/JAW.

The Savannah River Ecology Laboratory (SREL) Wood Stork program is a long-term program including various facets. It is primarily aimed at determining the importance of the SRSS to foraging storks and managing the Kathwood Foraging Ponds. In order to accomplish this we have examined the breeding biology of the birds at the colony to determine when the birds may have maximum food demand. We have also studied foraging ecology of the birds in order to gain insights that would allow us to develop a more effective management plan for the Kathwood ponds. More specifically, the objectives of the work carried out in 1986 were: (1) to determine the locations of foraging sites of Wood Storks from the Birdsville colony and examine year-to-year variation in sites used; (2) to characterize in more detail the habitat, vegetation, water quality and prey density/biomass at these sites; (3) to observe the breeding birds to determine the times when food demands at the colony are greatest; (4) to examine the movement of storks from the rookery to foraging sites and relate seasonal trends to the breeding biology; (5) to examine the importance of the SRSS to foraging Wood Storks; and (6) to examine the movements of individual birds to determine the generality of the observed patterns. At the Kathwood ponds we monitored water quality to ensure that water conditions were optimal for the stocked aquatic prey, determined when to make the ponds available to the storks, and monitored the numbers of storks and other wading birds at the ponds. In this report, I present the results of the studies carried out during 1986.

37848 **(PB—88-184007/XAB) Handbook: improving POTW (Publicly Owned Treatment Works) performance using the Composite Correction Program Approach.** (Environmental Protection Agency, Cincinnati, OH (USA). Center for Environmental Research Information). Oct 1984. 270p. (EPA—625/6-84/008). NTIS, PC A12/MF A01.

It is clear that only the most-effective design and operation of pollution-control facilities will be adequate to ensure continued protection of this Nation's natural resources. It is essential that the authors achieve the maximum performance possible of existing Publicly Owned Treatment Works (POTWs) to achieve maximum benefit from their expenditures. The purpose of the Handbook is to provide POTW owners/administrators and the engineering community with a new source of information to be used in improving the performance of POTWs through application of the Composite Correction Program (CCP) approach. It is the intent of the manual to supplement the existing body of knowledge in this area.

37849 **(PB—88-185095/XAB) WASP4, a hydrodynamic and water-quality model - model theory, user's manual, and programmer's guide.** Ambrose, R.B.; Wool, T.A.; Connolly, J.P.; Schanz, R.W. (Environmental Protection Agency, Athens, GA (USA). Environmental Research Lab.). Jan 1988. 317p. (EPA—600/3-87/039). NTIS, PC A14/MF A01.

See also PB—87-110995.

The Water Quality Analysis Simulation Program Version 4 (WASP4) is a dynamic compartment-modeling system that can be used to analyze a variety of water-quality problems in a diverse set of water bodies. WASP4 simulates the transport and transformation of conventional and toxic pollutants in the water column and benthos of ponds, streams, lakes, reservoirs, rivers, estuaries, and coastal waters. The WASP4 modeling system covers four major subjects--hydrodynamics, conservative mass transport, eutrophication-dissolved oxygen kinetics, and toxic chemical-sediment dynamics. The WASP4 modeling system consists of two stand-alone computer programs, DYNHYD4 and WASP4, that can be run in conjunction or separately. The hydrodynamic program, DYNHYD4, simulates the movement of water and the water quality program, WASP4, simulates the movement and interaction of pollutants within the water. The latter program is supplied with two kinetic submodels to simulate two of the major classes of water-quality problems--conventional pollution (dissolved oxygen, biochemical oxygen demand, nutrients, and eutrophication) and toxic pollution (organic chemicals, heavy metals, and sediment). The substitution of either sub-model constitutes the models EUTRO4 and TOXI4, respectively.

37850 **(PB—88-186754/XAB) Environmental regulations and technology: use and disposal of municipal waste-water sludge.** (Environmental Protection Agency, Cincinnati, OH (USA). Center for Environmental Research Information). Sep 1984. 83p. (EPA—625/10-84/003). NTIS, PC A05/MF A01.

The document describes the five major sludge use/disposal options currently available--land application, distribution and marketing of sludge products, land-filling, incineration, and ocean disposal--and factors influencing their selection and implementation. It also provides an initial framework for evaluating sludge use/disposal alternatives, and describes accepted and proven use/disposal technologies and Federal regulations pertinent to sludge management.

37851 **(DOE/EA—0265) Revised proposed general power marketing criteria and allocation criteria for Salt Lake City area: Environmental assessment.** (USDOE Western Area Power Administration, Boulder City, NV. Boulder City Area Office). Apr 1985. 208p. NTIS, PC A10/MF A01;1; GPO Dep. Order Number DE88010396/JAW.

Potential economic impacts on the human environment are stressed because the determination was made early in the assessment process that no interaction with components of the natural environment was expected. This determination was made on the basis that no change in operations of any facilities would result from implementation of the Allocation Criteria. The economic analyses involve investigation of Conservation and Renewable Energy Article, Resale of Electric Energy Article, the ten-year contract term, the method of power and energy allocation, the amounts of marketable firm power and energy, and the method of billing the cost of firming purchases on a pass-through basis.

37852 **(DOE/EIS—0120-Vol.1) Waste management activities for groundwater protection: Savannah River Plant, Aiken, South Carolina: Final environmental impact statement.** (USDOE, Washington, DC). Dec 1987. 450p. NTIS, PC A19;3. Order Number DE88008131/JAW.

The purpose of this environmental impact statement (EIS) is to assess the environmental impacts of proposed modifications and their alternatives to hazardous, low-level radioactive, and mixed waste management activities at the Savannah River Plant. The EIS, which is both a programmatic and a project-specific document, considers implementation of remedial and closure actions at hazardous, low-level radioactive, and mixed waste sites; establishment of new onsite disposal facilities for hazardous, low-level, and mixed wastes; potential changes in the discharge of disassembly-basin purge water from C-, K-, and P-Reactors to seepage basins. This EIS assesses the impacts of the modifications to waste management activities on air and water quality, especially on groundwater, ecological systems, health risk, archaeological resources, endangered species, and wetlands. Emphasis is given to the requirements of the Resource Conservation and Recovery Act, as amended, the Comprehensive Environmental Response, Compensation and Liability Act, as amended, and DOE Orders related to hazardous, low-level radioactive, and mixed wastes. 33 refs., 13 figs., 78 tabs.

37853 **(DOE/EIS—0120-Vol.2) Waste management activities for groundwater protection: Savannah River Plant, Aiken, South Carolina: Final environmental impact statement.** (USDOE, Washington, DC). Dec 1987. 556p. NTIS, PC A24/MF A01;1; GPO Dep. Order Number DE88008132/JAW.

Management of hazardous, low-level radioactive, and mixed waste for groundwater protection at the Savannah River Plant (SRP), Aiken, South Carolina is proposed. The preferred disposal alternative would involve modification of the SRP waste-management program to comply with all groundwater-protection requirements by implementing the following: (1) removal of wastes at selected existing waste sites to the extent practicable and implementing closure and groundwater remedial actions as required by applicable state and federal regulations; (2) establishment of a combination of retrievable storage, above ground, and below ground disposal facilities; and (3) continuation of the use of seepage and containment basins for the periodic discharge of reactor disassembly-basin purge. Groundwater contamination of aquifers would be controlled, improving on-site groundwater as well as surface water quality. As-

sociated public health risks, as well as risks associated with atmospheric releases, would be reduced. Risks from releases of transuranic and high level wastes, volatile organic compounds, heavy metals, radionuclides, and other miscellaneous chemicals would be contained. Some sites would be removed from public use. Other adverse impacts could include local and transitory on-site groundwater drawdown effects and minor short-term terrestrial impacts due to the use of borrow pits for backfill. Wildlife-habitat impacts could result due to land clearing and development. Volume 2 contains appendices A through F.

37854 **(DOE/EIS—0120-Vol.3) Waste management activities for groundwater protection: Savannah River Plant, Aiken, South Carolina: Final environmental impact statement.** (USDOE, Washington, DC). Dec 1987. 413p. NTIS, PC A18;3. Order Number DE88008133/JAW.

Management of hazardous, low-level radioactive, and mixed waste for groundwater protection at the Savannah River Plant (SRP), Aiken, South Carolina is proposed. The preferred disposal alternative would involve modification of the SRP waste-management program to comply with all groundwater-protection requirements by implementing the following actions: (1) removal of wastes at selected existing waste sites to the extent practicable and implementing closure and groundwater remedial actions as required by applicable state and federal regulations; (2) establishment of a combination of retrievable storage, above ground, and below ground disposal facilities; and (3) continuation of the use of seepage and containment basins for the periodic discharge of reactor disassembly-basin purge. Other adverse impacts could include local and transitory on-site groundwater drawdown effects and minor short-term terrestrial impacts due to the use of borrow pits for backfill. Wildlife-habitat impacts could result due to land clearing and development. Volume 3 contains Appendices G through L.

37855 **(DOE/EIS—0125-F) Intertie development and use: Final environmental impact statement: Volume 1, Environmental analyses.** (Bonneville Power Administration, Portland, OR (USA)). Apr 1988. 460p. NTIS, PC A20;3. Order Number DE88011480/JAW.

This environmental impact statement examines the environmental effects of three proposed Bonneville Power Administration actions with respect to the use and development of the Pacific Northwest/Pacific Southwest Intertie. The actions are: expansion of the capacity of the Intertie; adoption of a Long-Term Intertie Access Policy (IAP), which will set the ground rules for use of the Intertie by utilities other than BPA for short and long-term transmission of surplus power to California; and decisions by BPA to enable, through its access policies and marketing efforts, various types and levels of firm power marketing between the Northwest and California. BPA is proposing these actions in order to make possible additional short- and long-term sales of federal power surplus to that needed for serving Northwest loads and to increase the ability to deliver surplus power when the surplus is most valuable to the importing region. Additionally, the actions are needed to increase economic efficiency, to support environmental quality goals, and to enhance the ability of BPA to repay its US Treasury investment in a timely fashion while maintaining reasonable power rates for its wholesale customers in the Northwest. There is a need for an equitable procedure to allocate access to Intertie capacity that is excess to what BPA requires for its own use and to provide opportunities for assured access to make possible long-term firm power transactions by utilities other than BPA. 192 refs., 22 figs., 90 tabs.

37858 **(LA—11105-PR) Life Sciences Division: Annual report, 1986.** Fink, M. (comp.). (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 130p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88010472/JAW.

This report summarizes research and development of the Life Sciences Division of Los Alamos National Laboratory for the calendar year 1986. Activities of the Life Sciences Division were supported by the US Department of Defense, the National Institutes of Health, the Nuclear Regulatory Commission, and private industry. Technical reports offer the informed reader sufficient detail to assess the scope and significance of projects. Summaries useful to the casual reader appear in the overview. Further information is available from the investigators on the staff of the Life Sciences Division.

37859 **(LA—11235-PR) Life Sciences Division: Annual report, 1987.** Ortiz, R.; Spitzmiller, D.; Scott, N. (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 108p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010478/JAW.

This report summarizes the research and development activities of Los Alamos National Laboratory's Life Sciences Division for the calendar year 1987. Technical reports related to the current status of projects are presented in sufficient detail to permit the informed reader to assess their scope and significance. Summaries useful to the casual reader desiring general information have been prepared by the Group Leaders and appear in each group overview. Investigators on the staff of the Life Sciences Division will be pleased to provide further information. The individual programs are grouped as genomic structure and regulation, neural processing and chemistry, molecular structure, flow cytometry, cell growth and differentiation, radiation biology, pulmonary biology, and carcinogenesis.

37860 Circular dichroism microscopy of compact forms of DNA and chromatin in vivo and in vitro: cholesteric liquid-crystalline phases of DNA and single dinoflagellate nuclei. Livolant, F.; Maestre, M.E. (CNRS, Ivry-sur-Seine (France)). *Biochemistry;* **27**: No. 8, 3056-3068(19 Apr 1988). Contract AC03-76SF00098.

Two highly condensed structures of DNA have been analyzed in the circular dichroism (CD) microscope: the cholesteric liquid-crystalline phase of DNA and the nucleus of a dinoflagellate (Prorocentrum micans). In both cases, the DNA shows a helical cholesteric organization, but the helical pitch equals about 2500 nm in the first case and 250 nm in the second one. Since the absorption band of DNA is located at 260 nm, the reflection and absorption bands are well separated in the cholesteric phase of DNA and are overlapping in the dinoflagellate nucleus. However, both structures give a very strong negative CD signal at 265 nm. The authors show that this very strong signal cannot correspond to a Borrmann effect, i.e., to a superposition of the absorption and reflection bands, but is a differential absorption of left versus right circularly polarized light. This anomalous differential absorption is probably due to a significant scattering of light, inside of the structure, which produces a resonance phenomenon in the absorption band of the chromophore. Intercalative dyes were inserted in the dinoflagellate chromatin. The CD signal recorded in their absorption bands mimics the signal observed in the absorption band of DNA. In both structures, the negative sign of the CD at 265 nm indicates that the twist occurring between DNA molecules is left-handed, and they show that this situation is the more frequently encountered in vivo and in vitro.

37861 Transposon tagging and molecular analysis of the maize regulatory locus opaque-2. Schmidt, R.J.; Burr, F.A.; Burr, B. (Brookhaven National Lab., Upton, NY (USA)). *Science (Washington, D.C.);* **238**: 960-963(13 Nov 1987).

Genetic analyses suggested that the opaque-2 (o2) locus in maize acts as a positive, transacting, transcriptional activator of the zein seed storage-protein genes. Because isolation of the gene is requisite to understanding the molecular details of this regulation, transposon mutagensis with the transposable element suppressor-mutator (Spm) was carried out, and three mutable o2 alleles were obtained. One of these alleles contained an 8.3-kilobase autonomous Spm, another a 6.8-kilobase nonautonomous Spm, and the third an unidentified transposon that is unrelated to Spm. A DNA sequence flanking the autonomous Spm insertion was verified to be o2-specific and provided a probe to clone a wild-type allele. Northern blots indicated that the gene is expressed in wild-type endosperm but not in leaf tissues or in endosperms homozygous for a mutant allele of the O2 gene. A transcript was detected in endosperms homozygous for mutations at opaque-7 and floury-2, an indication that O2 expression is independent of these two other putative regulators of zein synthesis.

37862 Isolation and characterization of a cDNA clone encoding wheat germ agglutinin. Raikhel, N.V.; Wilkins, T.A. (Michigan State Univ., East Lansing (USA)). *Proceedings of the National Academy of Sciences of the United States of America;* **84**: No. 19, 6745-6749(Oct 1987). Contract AC02-76ER01338.

Two sets of synthetic oligonucleotides coding for amino acids in the amino- and carboxyl-terminal portions of wheat germ agglutinin were synthesized and used as hybridization probes to screen cDNA libraries derived from developing embryos of tetraploid wheat. The nucleotide sequence for a cDNA clone recovered from the cDNA library was determined by dideoxynucleotide chain-termination sequencing in vector M13. The amino acid sequence deduced from the DNA sequence indicated that this cDNA clone (pNVR1) encodes isolectin 3 of wheat germ agglutinin. Comparison of the deduced amino acid sequence of clone pNVR1 with published sequences indicates isolectin 3 differs from isolectins 1 and 2 by 10 and 8 amino acid changes, respectively. In addition, the protein encoded by pNVR1 extends 15 amino acids beyond the carboxyl terminus of the published amino acid sequence for isolectins 1 and 2 and includes a potential site for N-linked glycosylation. Utilizing the insert of pNVR1 as a hybridization probe, the authors have demonstrated that the expression of genes for wheat germ agglutinin is modulated by exogenous abscisic acid. Striking homology is observed between wheat germ agglutinin and chitinase, both of which are proteins that bind chitin.

37863 (CONF-8803102—3) Ultrastructure and function of erythrocyte membrane skeleton. Shen, B.W. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012003/JAW.

From International conference on advanced science and technology; Chicago, IL, USA (19 Mar 1988).

The membrane of the human erythrocyte is reinforced along its entire cytoplasmic surface by a two-dimensional network of peripheral proteins that closely adhere to the membrane proper through specific protein-protein interactions. This protein network resembles a shell that retains the approximate size and shape of the membrane ghost and is generally termed the skeleton. Spectrin, the major constituent of the membrane skeleton, accounts for approximately 75% of the skeletal protein mass. The molecular structure of spectrin is discussed in this paper.

37864 (GSF—20/87) European symposium on cytometry. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.)). 1987. 70p. (CONF-8709282—). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753542/JAW.

From European symposium on cytometry; Baden-Baden, F.R. Germany (25 Sep 1987).

This book of abstracts contains 59 contributions about cervical prescreening, expert systems, breast cancer, ploidy analysis, system and data evaluation, sampling, preparation and staining, image cytometry, general cytometry, cell kinetics with clinical applications.

37865 (DOE/ER/13588—2) Genetics and biochemistry of surfactant synthesis in arthrobacter species H13-A: Progress report, August 1, 1987-July 31, 1988. Finnerty, W.R. (Georgia Univ., Athens (USA). Dept. of Microbiology). 1988. Contract FG09-86ER13588. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011552/JAW.

We have sought the structural elucidation of the glycolipid biosurfactant. The extracellular glycolipid consists of 1 major component (>90%) plus 6–7 minor molecular species. The deacylated water-soluble backbone is common to all molecular species of the glycolipid. A complex fatty acid composition characterizes the glycolipid and contributes to its surface active character. The water soluble backbone consists of glycerol, trehalose and 3–5 glucose residues. FTIR spectroscopy has confirmed the presence of these polyhydric components. The next major objective has been to clone the genes for glycolipid biosynthesis in Rhodococcus sp. H13-A. Improvements in the E. coli-Rhodococcus shuttle vector, pMVS301, were made prior to the construction and screening of a genomic library in Rhodococcus. A system is being developed for transpositional mutagenesis in Rhodococcus, using Tn917 containing plasmids used successfully in Bacillus sp. for the isolation and analysis of sporulation and developmental genes. We are also actively assessing the utility of this cloning and transformation system which we have developed for Rhodococcus, for use in mycobacterium, a related Actinomycete for which there exists no systems for plasmid transformation or molecular cloning. 8 refs., 1 fig.

37866 (DOE/ER/60533—1) Studies of human mutation rates. Progress report. Neel, J.V. (Michigan Univ., Ann Arbor (USA). Dept. of Human Genetics). [1988]. Contract FG02-87ER60533. 13p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011893/JAW.

Progress is reported on several areas of study relating to human mutation rates. Efforts to study mutation at the DNA level dealt mainly with the development of probes to be employed in the program. Also reported on were genetic follow-up studies at the Radiation Effects Research Foundation in Hiroshima and Nagasaki. In the area of theoretical and applied genetics, progress is reported in 5 areas: l)likelihood analysis and phylogenetic inference; b)comparative F-statistics analysis; c)parentage assessment; d)haplotypic analysis of human admixture; and e)allelic spectrum analysis in agglomerated populations.

37867 **(PB—88-190707/XAB) Conservation biology of Furbish's lousewort. Final report, 1983-1986.** Menges, E.S. (Butler Univ., Indianapolis, IN (USA). Holcomb Research Inst.). Feb 1988. 70p. (HRI—128). NTIS, PC A04/MF A01.

A four-year study of the federally endangered, endemic Furbish's lousewort (Pedicularis furbishiae), has documented its distribution, life history, population dynamics, environmental preferences, reproductive biology, and genetic constitution. Lousewort population biology is affected two ways by the disturbance regime of the St. John's River. First, ice scour and bank slumping have caused high overwinter mortality and local population extinction, especially on saturated or wet soil. Such disturbances are the primary threat to both individuals and populations. Second, continued lack of disturbance, which allows successional changes (high vegetation cover and dominance by woody species) also reduces survival, growth, recruitment, germination, and seedling survivorship. Conservation tactics should include protection of extant populations and maintenance of an extensive wooded riverine corridor, thus providing potential habitat within a natural hydrological disturbance regime.

37868 **Mechanisms involved in the formation of mutagen-induced chromosome aberrations as determined by premature chromosome condensation.** Wolff, S.; Pantelias, G.E. (Lab. of Radiobiology and Environmental Health, Univ. of California, San Francisco, CA 94143 (US)). pp 167-176 of Genetic toxicology of environmental chemicals. Part B: Genetic effects and applied mutagenesis. Ramel, C.; Lambert, B.; Magnusson, J. New York, NY; Alan R. Liss Inc. (1986). (CONF-8506137—).

From 4. international conference on environmental mutagens; Stockholm, Sweden (24 Jun 1985).

In conventional studies of cytogenetic damage induced by mutagenic carcinogens, chromosomes are examined only when they become visible at metaphase, which often is many hours after exposure. Because many events can occur between the initial exposure and the final appearance of the damaged chromosomes at metaphase, the authors have now turned to the use of prematurely condensed chromosomes (PCCs) in which it is possible to observe interphase chromosomes shortly after exposure without allowing the cells to proceed to metaphase. Such a procedure, which eliminates the long delays between the introduction of the initial damage and its visualization, gives initial insights to the possible mechanisms involved in the production of genetic damage by mutagenic carcinogens. They used the method to study the effect of the pyrimidine nucleoside analogue cytosine arabinoside (ara-C), an inhibitor of DNA synthesis and chemotherapeutic agent that kills S phase cells and blocks the progression of cells from G_1 into S phase. The authors now used a simple method for polyethylene-glycol-mediated cell fusion and PCC induction to analyze the effects of ara-C on G_0 human lymphocytes. The PCC technique is a far more sensitive method for detecting damage than are the conventional metaphase techniques. Moreover, because only limited information is available on the repair of radiation damage in lymphocytes in the presence of DNA synthesis inhibitors, the technique was also used study the effect of ara-C on the repair of X-ray-induced chromosome breakage in unstimulated lymphocytes.

(Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.)). 1987. 222p. (In German). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen, (Germany, F.R.).

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

Our research team was given the task of studying the efficacy of diagnostic radiation in childhood. The goal of this study is to determine which diagnostic radiation has no efficacy and, because of its uselessness, should be avoided, and which procedure has only minimal efficacy so that in most cases it could be dispensed without negatively affecting the benefits for the patient or for public health. This second report comprises an extensive introduction and 9 chapters which were written partly by different authors and contain comprehensive references to deal with various aspects of diagnostic radiation in paediatrics. An appendix contains the questionnaires covering paranasal sinuses and head trauma, and also a motivating letter which was sent along with the questionnaires to doctors participating in the project.

The methods are discussed of the computer processing of dynamic scintigraphic studies which were developed, studied or implemented by the authors within research task no. 30-02-03 in nuclear medicine within the five year plan 1981 to 85. This was mainly the method of computer processing radionuclide angiography, phase radioventriculography, regional lung ventilation, dynamic sequential scintigraphy of kidneys and radionuclide uroflowmetry. The problems are discussed of the automatic definition of fields of interest, the methodology of absolute volumes of the heart chamber in radionuclide cardiology, the design and uses are described of the multipurpose dynamic phantom of heart activity for radionuclide angiocardiography and ventriculography developed within the said research task. All methods are documented with many figures showing typical clinical (normal and pathological) and phantom measurements. (V.U.).

37897 **(ISH—104) Radiation exposure of patients due to medical measures.** Schwarz, E.R.; Tsavachidis, C.; Hinz, G.; Eigelsreiter, H. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Jan 1987. 223p. (In German). Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

The main objective of this research project supported by the Federal Ministry of the Interior was to collect the data required as a basis for an up-to-date assessment of the radiation exposure of the population as a result of medical measures. Apart from the fact that this had to be done in order to fulfill a commitment required by the EURATOM principles, the report in hand also presents a useful survey of the improvements achieved over the last years in terms of radiation hygiene in the field of imaging technology applied for medical diagnostics. The data obtained from four hospital centers (2 university hospitals, 1 city hospital, and one county hospital) and from three medical practices (radiologist, internal specialist, orthopedics), the changes experienced in the selection of imaging methods for diagnostic purposes in the period 1976 to 1983 or 1985 are illustrated, and analyses show the developmental trends. The results show that there is reason to assume the radiation exposure of the population to be receding.

In 1986 Scientific works.

In order to study the in vivo post-transfusion survival of autologous RBC's, the authors utilize a double isotope labelling technique (stored cells with 51 Cr and fresh cells with 99 m Tc). The details of this technique are given in the present report.

37899 **Ultrasonic imaging with a fixed instrument configuration.** Witten, A.; Tuggle, J.; Waag, R.C. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6049). *Applied Physics Letters;* **53**: No. 1, 16-18(4 Jul 1988).

Diffraction tomography is a technique based on an inversion of the wave equation which has been proposed for high-resolution ultrasonic imaging. While this approach has been considered for diagnostic medical applications, it has, until recently, been limited by practical limitations on the speed of data acquisition associated with instrument motions. This letter presents the results of an experimental study directed towards demonstrating tomography utilizing a fixed instrument configuration.

37900 **X-ray diffraction study of the polymorphic behavior of N-methylated dioleoylphosphatidylethanolamine.** Gruner, S.M.; Tate, M.W.; Kirk, G.L.; So, P.T.C.; Turner, D.C.; Keane, D.T.; Tilcock, C.P.S.; Cullis, P.R. (Princeton Univ., NJ (USA)). *Biochemistry;* **27**: No. 8, 2853-2866(19 Apr 1988). Contract FG02-87ER60522.

The polymorphic phase behavior of aqueous dispersions of dioleoylphosphatidylethanolamine (DOPE) and its N-methylated analogues, DOPE-Me, DOPE-Me_2, and DOPC, has been investigated by X-ray diffraction. In the fully hydrated lamellar (L/sub α/) phase at 2°C, the major structural difference is a large increase in the interlamellar water width from DOPE to DOPE-Me, with minor increases with successive methylation. Consistent with earlier reports, inverted hexagonal (H/sub II/) phases are observed upon heating at 5-10 °C in DOPE and at 65-75 °C in DOPE-Me and are not observed to at least 85 °C in DOPE-Me_2 or DOPC. It is shown that, in copious water, the disordered state transforms very slowly

into phases with cubic symmetry. This process is assisted by the generation of small amounts of lipid degradation products. The relative magnitudes of the monolayer spontaneous radius of curvature, are inferred from the H/sub II/ lattice spacings vs temperature and are shown to increase with increasing methylation. The relative magnitudes of R_0 are categorized as small for DOPE, intermediate for DOPE-Me, and large for DOPC. The relationship between the cubic phases and minimal periodic surfaces is discussed. The geometry of the equilibrium phases that occur may be largely understood on the basis of a competition between a spontaneous tendency for the monolayers to curl to a radius, R_0, and the need to pack similar hydrocarbon chains at near constant density and at a uniform mean length.

Pub. in Perception and Psychophysics, Vol. 41, No. 2, 87-116(1987). See also Part 2, AD-A190580.

A real-time visual-processing theory is developed to explain how three-dimensional form, color, and brightness percepts are coherently synthesized. The theory describes how several fundamental uncertainty principles that limit the computation of visual information at individual processing stages are resolved through parallel and hierarchical interactions among several processing stages. The theory provides unified analysis and many predictions of data about stereopsis, binocular rivalry, hyperacuity, McCollough effect, textural grouping, border distinctness, surface perception, monocular and binocular brightness percepts, filling-in, metacontrast, transparency, figural aftereffects, lateral inhibition within spatial frequency channels, proximity luminance covariance, tissue contrast, motion segmentation, and illusory figures, as well as about reciprocal interactions among the hypercolumns, blobs, and stripes of cortical areas V1, V2, and V4. Monocular and binocular interactions between a Boundary Contour (BC) System and a Feature Contour (FC) System are developed. The BC System, defined by a hierarchy of oriented interactions, synthesizes an emergent and coherent binocular boundary segmentation from combinations of unoriented and oriented scenic elements.

37917 **(AD-A—190455/6/XAB) Radiation-induced germ-cell mutations - their detection and modification. Technical report, 1 April 1983-30 June 1987.** Goldstein, L.S. (California Univ., San Francisco (USA)). 30 Jun 1987. 80p. NTIS, PC A05/MF A01.

Mutagenesis by densely ionizing radiation represents a significant long-term hazard to the individual. Few data are available to describe the dose-response aspect of mutation induction by either accelerated charged particles or fission-spectrum neutrons in mammalian germ cells. To address this question, an in-vitro assay of dominant lethal mutations was undertaken for animals exposed to either of these radiation sources. Special emphasis was placed on the action in spermatogonial stem cells. The data indicate that mutations were induced as a linear function of dose and there was no evidence of a threshold. Mutagenesis was also detected in females given x radiation. The induction curve had an initial steep linear aspect and then a less-steep slope. As with male germ cells, there was no evidence of a threshold. The in vitro dominant lethal data were compared to various cytogenetic assays and were found to be more sensitive indicators of mutation. In preliminary studies, the rate of stable mutagenic damage appeared to be modifiable by pretreatment with chemotherapeutic drugs. Because the radiation sources chosen for this study are thought to be the most efficient for mutation induction, the values obtained may describe the upper limits of exposure for this endpoint. As applied to risk estimation, these data should be considered relative to the normal risk encountered and accepted by the population at large.

Abstract in French.

As part of the NATO Dosimetry Intercomparison Project, a series of experiments were conducted at Aberdeen Proving Ground in September 1986 in order to determine neutron and gamma-ray doses delivered to various internal and external locations on an anthropomorphic phantom from a fission source. Thus, the effect of such parameters as self-shielding by the body on dosimeter reading may be determined. The results will be used eventually to validate computer simulations of the Aberdeen environment in order to understand completely the correlation between dosimeter reading and bone marrow dose, or other parameters relating to performance decrement.

37919 **(BMU—1987-149) Blood stem cell changes as an indicator of a radiation exposure and prognostic relevance. Report for the period 1.10.1980 - 30.9.1986. Final report.** Fliedner, T.M.; Nothdurft, W. (eds.). (Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.); Ulm Univ. (Germany, F.R.). Abt. Klinische Physiologie und Arbeitsmedizin). 1987. 26p. (In German). GRM Werbeberatung - Werbemittlung - PR, Eggenstein-Leopoldshafen,, Germany, F.R.

Schriftenreihe Reaktorsicherheit und Strahlenschutz. Ergebnisberichte, Untersuchungen, Studien, Gutachten.

The aim of the research study was to examine to what extent changes in the blood picture will allow conclusions to be drawn for the degree of damage to the bone marrow and for the recovery capacity of haemopoiesis following different radiation exposures. Changes in the granulocyte counts allow to see direct relationships to the bone marrow injury and regeneration processes at various radiation exposures. The same applies to the platelet count. Under specific exposure conditions, however, the lymphocyte concentration alternatives are hardly suitable for a differentiated assessment of the functional state of blood cell formation.

37920 **(BNL—40978) Background mortality information: Methodology and example results using three environmental assessment reference repository site data bases.** Grimshaw, C.A. (Brookhaven National Lab., Upton, NY (USA)). Jun 1987. Contract AC02-76CH00016. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007546/JAW.

Cancer mortality data were examined as part of an evluation to assess health impacts of possible radiation releases from an operating geologic repository. Tables of the general results obtained are given. This report gives an example of the type of results that can be achieved by running the US mortality and population data base analysis computer package. 5 refs., 1 fig., 7 tabs.

37921 **(CEA-R—5424) Studies and activities in the field of chemical toxicology carried out by the service d'hygiene industrielle.** Chalabreysse, J.; Archimbaud, M.; Teulon, F. and others. (CEA Etablissement de la Vallee du Rhone, 30 - Bagnols-sur-Ceze (France)). Feb 1988. 79p. (In French). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753938/JAW.

The Service d'Hygiene Industrielle (Industrial hygiene service, Institute of protection and nuclear safety, Department of health protection - IPSN-DPS) has acquired an unquestionable proficiency in chemical toxicology on account of 1) its missions of research on and monitoring of workers, working conditions and the environment on the Tricastin industrial complex and 2) of its actions of technical assistance to the CEA group and of valorization outside the group. The report presents how toxicological hazards originated from the use of chemical products by the nuclear industry are taken into consideration. A global methodology of assessment of chemical-toxicological hazards has been developed; it is based on the experience gained in various occupational branches (nuclear and non-nuclear industry, agriculture, administrations,...). The Service d'hygiene industrielle is developing R and D studies in the field of biology and analytical chemistry based on the present knowledge and doctrine in radiotoxicology (uranium especially). The contribution of radiation protection and radiotoxicology to non-nuclear industrial hygiene can thus be appreciated.

37922 **(CONF-8805105—1) Estimation of ^{244}Cm intake by bioassay measurements following a contamination incident.** Thein, M.; Bogard, J.S.; Eckerman, K.F. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 15p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010140/JAW.

From 2. international conference on low level measurements of actinides and long-lived radionuclide in biological and environmental samples; Akita City, Japan (16 May 1988).

An employee was contaminated with radioactive material consisting primarily of ^{244}Cm and ^{240}Cm as a consequence of handling a curium nitrate solution at a reprocessing facility. In vivo gamma analysis and in vitro (urine and fecal) analysis were initiated soon after the incident. Further in vivo measurements were performed regularly through hour 528, and in vitro bioassay measurements were obtained through day 74. A sample of the curium solution from the workplace was obtained to confirm that the nitrate was the chemical form and to identify the curium isotopes present. The mass ratio of ^{244}Cm:^{248}Cm was determined to be 91:7. Diethylenetriaminepentaacetate (DTPA) was administered on hours 33 and 71. Observed excretion rates were consistent with available information for curium in the literature. In this paper, the results of the in vivo and in vitro measurements are presented and intake estimates for the incident are developed using various excretion rate functions. 11 refs., 3 figs., 2 tabs.

37923 **(DOE/AL/27458—T2) Shellfish depuration by gamma irradiation: Final report for the period October 1, 1985-September 30, 1986.** Beghian, L.; Melnick, J. (Lowell Univ., MA (USA). Radiation Lab.; Baylor Univ., Houston, TX (USA). Coll. of Medicine; National Marine Fisheries Service, Gloucester, MA (USA)). 1 Nov 1986. Contract FG04-84AL27458. 36p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011140/JAW.

Irradiation of live bivalve molluscs is a promising new technique to reduce the public health threats of viral and bacterial pathogens in the consumption of raw shellfish. In studies conducted within the past year, live hardshelled clams and oysters were innoculated with Simian Rotavirus SA-11, Poliovirus I, and Hepatitis-A virus and treated with gamma ray ionizing radiation from University of Lowell/DOE 800,000 Curie ^{60}Co source over a dose range of 0.5--10 kiloGray (50--1000 kilorad) to determine the effectiveness of the process in eliminating viral activity and thus easing the potential viral health threats associated with uncooked bivalves. Two viral strains, SA-11 and Poliovirus I, were employed as models to perfect laboratory technique and to estimate the most appropriate range of dose exposures necessary for optimal inactivation of the infectious pathogen, Hepatitis A. Post-irradiation survivorship of the oysters and quahogs was assessed over a range of exposures, and showed an exceptionally high degree of radioresistance for these molluscan species. 7 refs., 7 figs., 14 tabs.

37924 **(DOE/CH/10330—1) Genetic effects of plutonium in Drosphila: Progress report, June 1987-April 1988.** Kale, P. (Alabama A and M Univ., Normal (USA). Dept. of Biology). 27 Jun 1988. Contract FG02-87CH10330. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011553/JAW.

The spontaneous mutation rate in our Drosophila is very low and does not vary from one experiment to another. These stocks are therefore quite suitable for comparisons with similar data from experiments with plutonium or alpha radiation.

37925 **(DOE/ER—60089-2) Studies of human mutation rates, December 1, 1985--November 30, 1986.** Neel, J.V. (Michigan Univ., Ann Arbor (USA). Dept. of Human Genetics). 1 May 1985. Contract AC02-82ER60089. 134p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88009918/JAW.

This program seeks to quantify native human mutation rates and to determine how man's activities may affect these rates. The program is divided into six tasks, i.e. The American Indian mutation rate, monitoring populations for frequency of mutation by electrophoresis of blood proteins, application of molecular biological approaches to the detection and study of mutational events in

human populations, development of two-dimensional electrophoresis for identification of mutant proteins, co-operative program with the Radiation Effects Research Foundation in Hiroshima and Nagasaki, Japan, and statistical problems associated with the estimation of mutation rates. Progress of each of the above tasks is related in detail. (DT)

37926 **(DOE/ER—60089-3) Studies of human mutation rates: Progress report.** Neel, J.V. (Michigan Univ., Ann Arbor (USA). Dept. of Human Genetics). 1 Jul 1988. Contract FG02-87ER60533. 29p. NTIS, PC A03;3. Order Number DE88009881/JAW.

Progress was recorded between January 1 and July 1, 1987 on a project entitled "Studies of Human Mutation Rates". Studies underway include methodology for studying mutation at the DNA level, algorithms for automated analyses of two-dimensional polyacrylamide DNA gels, theoretical and applied population genetics, and studies of mutation frequency in A-bomb survivors.

37927 **(DOE/ER/60369—T1) Mechanisms for Radon-222 transport in vascular plants, and uptake of radium-226 in C_3 and C_4 species: Final report for period August 5, 1985-December 31, 1987.** Lewis, B.G. (Northwestern Univ., Evanston, IL (USA)). May 1988. Contract FG02-85ER60369. 49p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011607/JAW.

Previous work in our laboratory had provided quantitation of plant exhalation of Radon-222. This present work focused on the mechanisms of the phenomenon. Experiments with radon diffusion through paraffin indicated that plant epicuticular wax would present essentially no barrier to radon unlike its effect on water vapor diffusion. Thus, radon and water transport in the plant appear to be decoupled primarily in the leaf mesophyll. Transport of radon from root to leaf appears to be primarily as convective flow in the xylem fluid, but diffusion of radon from the fluid into air spaces within the plant probably occurs. Experiments with plants in solution culture indicated that, generally, C_3 species tended to have higher tissue concentrations of Radium-226, but these differences were less marked, and could even be reversed, for C_3 and C/sub 4 plants within the same genus. Manipulating solution culture pH was not dramatically effective in reducing Radium-226 uptake. 8 refs., 3 figs., 6 tabs.

37928 **(DOE/ER/60502—2) The development of in vitro mutagenicity testing systems using T-lymphocytes: Progress report, November 1, 1987--May 31, 1988.** Albertini, R.J. (Vermont Univ., Burlington (USA)). May 1988. Contract FG02-87ER60502. 13p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011141/JAW.

We have investigated the mutagenic effects of ionizing irradiations in human T-lymphocytes. These have included in vitro exposure of G_0 phase peripheral blood T-lymphocytes to gamma irradiation, with subsequent growth for phenotypic expression and selection of 6-thioguanine resistant (TG/sup r/) colonies to measure mutation induction at the hprt mutations. We have studied the DNA alterations in both in vivo and in vitro induced mutants by Southern blot analysis with an hprt cDNA probe in order to investigate the possible specificity of radiation damage. We have employed Southern blot analyses with T-cell receptor (TCR) gene probes in order to define the clonality of these mutants and allow definition of the mutation frequency underlying the measured mutant frequency. This approach has allowed us to define the molecular nature of mutations induced both in vivo and in vitro by ionizing radiation. Southern blot analysis of 70 in vitro mutant clones induced by 300 rads of gamma irradiation have shown them to be the result of 24 independent mutations by TCR gene rearrangement patterns. Eighteen (0.66) of these were found to have large hprt DNA alterations. Individuals therapeutically exposed to ionizing irradiations show higher TG/sup r/ mutant frequencies than those found in normal controls and a higher fraction of these mutants also contain hprt gene alterations detected by Southern blot analysis (0.34 vs. 0.10–0.15 in controls, respectively). The fraction of mutations which contain detectable DNA alterations is thus elevated after both in vitro and in vivo irradiation of the cells. Analysis of breakpoints in these mutants has allowed us to estimate the maximum size deletion recoverable at the hprt locus. 8 refs., 5 figs., 4 tabs.

37929 **(DOE/RL/11374—T1) Radiofrequency radiation-induced calcium-ion-efflux enhancement from human and other neuroblastoma cells in culture: [Final technical report].** Dutta, S.K.; Ghosh, B.; Blackman, C.F. (Howard Univ., Washington, DC (USA); Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). [1988]. Contract AI06-87RL11374. 14p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011609/JAW.

In order to test the generality of radiofrequency-radiation-induced change in alternation of ^{45}Ca/sup 2{plus/} efflux from avian and feline brain tissues, human neuroblastoma cells were exposed to electromagnetic radiation at 147 MHz, amplitude modulated (AM) at 16 Hz, at specific absorption rates (SAR) of 0.1, 0.05, 0.01, 0.005, 0.001, and 0.0005 Wkg. Significant ^{45}Ca/sup 2{plus/} efflux was obtained at SAR values of 0.05 and 0.005 Wkg. Enchanced efflux at 0.05 Wkg peaked at the 13-to-16 Hz and at the 57.5-to-60 Hz modulation ranges. A Chinese hamster-mouse hybrid neuroblastoma was also shown to exhibit enchanced radiation-induced ^{45}Ca/sup 2{plus/} efflux at an SAR of 0.05 Wkg, using 147 MHz, AM at 16 hz. These results confirm that amplitude-modulated radiofrequency radiation can induce response in cells of nervous tissue origin from widely different animal species including humans. The results are also consistent with reports of similar findings in avian and feline brain tissue reported by others and indicate the general nature of the phenomenon. 9 refs., 3 tabs.

37930 **(EUR—10953) Radiation protection progress report 1986.** (Commission of the European Communities, Luxembourg). 1987. 1731p. Commission of the European Communities, Luxembourgh.

The progress report of the radiation protection programme outlines the research work carried out in 1986 under contracts between the Commission of the European Communities and research groups in the Member States. Results of more than 330 projects are reported. They are grouped into six sectors: radiation dosimetry and its interpretation, behaviour and control of radionuclides in the environment, non-stochastic effects of ionizing radiation, radiation carcinogenesis, genetic effects of ionizing radiation, evaluation of radiation risks and optimization of protection. Within the framework programme, the aim of this scientific research is to improve the conditions of life with respect to work and protection of man and his environment and to assure a safe production of energy, i.e.: (i) to improve methods necessary to protect workers and the population by updating the scientific basis for appropriate standards, (ii) to prevent and counteract harmful effects of radiation, (iii) to assess radiation risks and provide methods to cope with the consequences of radiation accidents.

37931 **(GSF-BPT—2/87) Effect of enhanced UV-B radiation and of other stress factors on marine phytoplankton. Final report.** Doehler, G. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Bereich Projekttraegerschaften). 1987. 95p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753545/JAW.

The impact of UV-B stress on the uptake of inorganic nitrogen compounds by several marine diatoms has been studied. Synedra has shown specially strong sensitivity to UV-B radiation, whereas the Lithodesmium species isolated in Japan has been less damaged in the experiments. Uptake of ^{15}N-ammonium is much more affected than the uptake of ^{15}N-nitrate. Experiments with Ditylum have shown that exposure to UV-B radiation at different times of the day produces effects. Different response to UV-B exposure with simultaneous exposure to monochromatic light has likewise been observed. The reversible UV-B induced damage observed after the first day of exposure becomes irreversible upon second exposure. The pattern of ^{14}C- and ^{15}N-labelled amino acids is significantly changed by UV-B stress. (orig.KG) With 50 refs., 15 tabs., 51 figs..

37932 **(GSI—87-11) Third workshop on heavy charged particles in biology and medicine. Book of abstracts.** Kraft, G.; Grundinger, U. (eds.). (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Jul 1987. 241p. (CONF-870779—). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753546/JAW.

From 3. workshop on heavy charged particles in biology and medicine; Darmstadt, F.R. Germany (13 Jul 1987).

The book of abstracts contains 67 papers presented at the workshop. Main topics are: Physics, chemistry, DNA, cell biology, cellular and molecular repair, space biology, tumor and tissue biology, predictive assays, cancer therapy, and new projects. Separate entries in the database are prepared for all of these papers.

From 3. workshop on heavy charged particles in biology and medicine; Darmstadt, F.R. Germany (13 Jul 1987).

Extensive investigations of lethal effects of γ-rays and high LET particles have been performed at different levels of cell organisation and under various conditions in Dubna. Cell survival curves were measured for bacterial, yeast, and mammalian cells. In order to explain the observed curves, a program calculating energy fluctuations in sensitive microvolumes was developed. The program of biological investigations in JINR, Dubna, is substantially extended now. Beside lethal effects the mutagenic action of various types of ionising beams is studied. A new mighty accelerator has been reconstructed. It is a synchrocyclotron with the maximum output of about 50 μA of 60 MeV protons. The machine gives proton, neutron and negative pion beams for clinical purposes. There is an extensive biological program on the accelerator including investigation of lethal, mutagenic and carcinogenic effects.

37972 (GSI—88-05-Prepr.) **Induction of chromosome aberrations in Chinese hamster cells after heavy ion irradiation.** Ritter, S.; Kraft, G. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Jan 1988. 8p. (CONF-8710285—). Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.).

From NATO advanced study institute on terrestrial space radiation and its biological effects; Corfu, Greece (12 Oct 1987).

The induction of structural chromosome changes in V 79-Chinese hamster cells following heavy ion irradiation is studied. Asynchronous exponentially growing cells are exposed to the heavy ion beams at the Unilac, Darmstadt and the Ganil, Caen. The induction of chromosome aberrations was measured as a function of time after exposure.

37973 (HEHF—54-87) **United States Transuranium Registry: Annual report, October 1, 1986 through September 30, 1987.** Swint, M.J.; Kathren, R.L. (Hanford Environmental Health Foundation, Richland, WA (USA)). Apr 1988. 37p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011047/JAW.

This report summarizes progress of the United States Transuranium Registry for the 1987 fiscal year, including as an appendix the observations and recommendations of the Scientific Advisory Committee. Completion of the first phase of the analytical laboratory intercomparison study has led to verification and reduction in the uncertainty of the values for two NBS Standard Reference Materials. The human arm phantom built as an in-vivo counting calibration standard for Am-241 has been completed and made available for use by other laboratories, along with the previously completed skull phantom. Preliminary evaluation of USTR Case 193, a whole body plutonium case, was completed and reported at a national scientific meeting. The autopsy results tend to verify improvements in recent biokinetic models. Tissue donation was received from a former Hanford worker who received an extensive internal deposition of Am-241 from an explosion in a glove box 10 years prior to death from heart disease. Because of the extraordinary nature of this case, plans are being developed for interlaboratory collaboration to ensure that the knowledge derived from evaluation of this case will be maximized.

37986 **(ISH—73) Analysis of leukemia deaths in Bavaria in the period 1976-1981. Pt. 1. Basis, methodology and realisation, analysis of patients' medical records.** Grosche, B.; Hinz, G.; Kaul, A.; Tsavachidis, C. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Jun 1987. 188p. (In German). Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

This volume is intended to give a survey of the quality of the collected data and a description. It is also intended to show on what assumptions the existing data can be used for a description of the regional distribution of leukemia deaths in Bavaria. The question whether an analysis of mortality can give information on morbidity remains open. Due to discussions on the possible connection between the operation of nuclear plants and the increase in leukemia, the Institute of Radiation Hygiene of the West German Department of Health carried out an analysis of leukemia deaths in Bavaria, on behalf of the Bavarian Ministry of Development and the Environment.

37987 **(ISH—98) Literature study on the physiology of cobalt.** Erzberger, A. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Dec 1986. 71p. (In German). Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

This literature study analyses the metabolism of cobalt in the human body, focussing on its resorption and the influence of various parameters like its chemical form, antagonisms, etc. on the level of resorption rate. The value currently recommended by ICRP for

resorption rates (f_1 factor) of 0,3 or 0,05 for man is examined for its confirmation or non-confirmation in literature.

37988 **(ISH—105) Model for calculating the aerosol deposition in the human respiratory tract, with particular regard to children and infants.** Hornik, S.; Roedler, H.D.; Gerich, B. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Jan 1987. 55p. (In German). Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

For this research project, the deposition of inhaled aerosols in the total lung of adults and also in lung compartments has been calculated as a function of particle diameter, applying various calculation models and the resulting equations. The models and equations that best described the experimental results have then be applied to calculate the deposition in infants and ten-year-old children. The results obtained show that for children and infants, radiation dose calculations for inhaled radioactive aerosols of an activity of 1 μm can be done using the values determined for the deposition in adults. In the case of larger particle diameters, with a median aerodynamic diameter of 8 μm for example, calculations for infants have to take into account the increased tracheobronchial deposition, and calculations for children have to consider increased pulmonary deposition.

37989 **(ISH—111) Biological indicators of radiation exposure - serum amylase increase following irradiation of salivary glands.** Hofmann, R.; Pufal, D.; Boegl, W.; Willich, N.; Westhaus, R. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene; Klinikum Grosshadern, Muenchen (Germany, F.R.). Radiologische Klinik und Poliklinik). (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene; Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). Jun 1987. 81p. (In German). Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

In this paper, an isoenzyme test is described which enables the proteins of pancreas to be differentiated from those of the salivary glands. This isoenzyme test, in combination with an antibody lipase test which inturn is sensitive to the pancreatic enzyme triacylglycerinlipase, has been used to examine a total of the 42 patients under radiation therapy. 25 of these patients had been subjected to partial body exposure of the head region and 17 to whole body exposure. The results show that the amount of activity increase depends upon the dose to the salivary glands and that almost exclusively the isoenzymes of these organs are responsible for the radiation-induced activity increase in the serum. The isoenzyme test proved to be a good approach in cases where pathogenic variations in the serum α-amylase activity concerning primarily the pancreatic glands had to be differentiated from radiation-induced variations.

37990 **(JINR-R—19-87-720) Radiosensitivity - let dependence in yeast. Effect of additional growth and their contribution in radioresistance and shape of survival curve in diploid yeast.** Lobachevskij, P.N.; Mishonova, V.B.; Cherevatenko, A.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702949/JAW.

A study was made of the contribution of additional growth effect (AGE) in survival of diploid yeast Saccharomyces cerevisiae and the influence of AGE on the shape of survival curve of cells, exposed to radiations with different linear energy transfer (LET). AGE was shown to be only factor determining the sigmoid shape of survival curve of diploid yeast, exposed to radiations with a high LET. The contribution of AGE in survival decreases by increasing LET, being conditioned by factors of physical and geometrical nature. 10 refs.; 1 fig.

37991 **(LUSG-WP—480) Child leukaemia around Sellafield: what Seascale said about the Black Report.** Macgill, S.M. (Leeds Univ. (UK). School of Geography). Jul 1986. 46p. British Library Document Supply Centre, Boston Spa, Wetherby, West Yorks LS23 7BQ.

The paper investigates reaction to the Black Report by the inhabitants of Seascale, the community whose situation - in terms of leukaemia incidence and proximity to Sellafield - was the focus of interest of that Report. The paper draws on an original interview-based social survey among the inhabitants of Seascale. As well as routine examination of response frequencies, a new methodological tool for reconstructing aggregate patterns of a large number of multiple character responses (from the Galois connections between response categories) is used as primary basis for interpretative analysis. It is found that the Black Report was received in Seascale with a mixture of confusion, satisfaction, deferred judgement and sharp criticism, and implications of this finding for the risk perception research field, as well as for policy makers, are brought out.

37992 **(NCRP—90) Neptunium: Radiation protection guidelines.** (National Council on Radiation Protection and Measurements, Bethesda, MD (USA)). 28 Feb 1988. 119p. National Council on Radiation Protection and Measurements, 7910 Woodmont Avenue, Bethesda, MD 20814;1. Order Number TI88010165/JAW.

The present report reviews the current knowledge of neptunium in areas which are important to radiation protection and makes recommendations on radiation protection guidelines. The report briefly reviews the chemical and physical properties of neptunium, the sources of neptunium in the environment, and potential pathways to man. The limited animal data on health effects are also examined. In addition, animal studies that may serve as a basis for predicting the metabolic behavior of neptunium in humans are considered. On the basis of the information examined, recommendations are made on the fraction of ingested neptunium absorbed from the gastrointestinal tract into blood (f_1). Finally, the report applies the available data to recommendations on radiation protection guidelines for neptunium.

37993 **(NRPB-R—217) Doses in radiation accidents investigated by chromosome aberration analysis. 18: a review of cases investigated, 1987.** Lloyd, D.C.; Edwards, A.A.; Prosser, J.S.; Moquet, J.E.; Finnon, P. (National Radiological Protection Board, Chilton (UK)). Mar 1988. 10p. H.M. Stationery Office, London, price Pound 4.00.

During 1987, 25 cases of suspected overexposure to ionising radiation were referred to the National Radiological Protection Board for investigation by cytogenetic analysis. Of the 25 cases, 14 were associated with industrial radiography, three were from major nuclear organisations and the remaining eight were from institutions of research, education or health. No biological indication of overexposure was found for 18 cases. Of the remaining seven, the numbers of chromosomal aberrations found indicated that their doses were small, with non exceeding 0.15 Gy. The chromosome data are compared with information from physical dosimetry and a brief summary is given of the circumstances of each case.

37994 **(NUREG/CP—0093) Ultrasensitive techniques for measurement of uranium in biological samples and the nephrotoxicity of uranium: Proceedings.** Kathren, R.L.; Weber, J.R. (eds.). (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 170p. (CONF-851267—; PNL—6511). NTIS, PC A08/MF A01 - GPO;1. Order Number TI88010718/JAW.

From Meeting on ultrasensitive techniques for measurement of uranium in biological samples and the nephrotoxicity of uranium; Washington, DC, USA (3 Dec 1985).

Edited transcripts are provided of two public meetings sponsored by the Division of Radiation Programs and Earth Sciences of the Nuclear Regulatory Commission, Occupational Radiation Protection Branch. The first meeting, held on December 3, 1985, included nine presentations covering ultrasensitive techniques for measurement of uranium in biological specimens. Topics included laser-spectrometric techniques for uranium bioassay, correlation of urinary uranium samples with air sampling results in industrial settings, delayed neutron counting, laser-kinetic phosphometry, isotope dilution mass spectrometry, resonance ionization spectroscopy, fission track analysis, laser-induced fluorescence, and costs of sampling and processing. The nine presentations of the second meeting dealt with the nephrotoxicity of uranium. Among the topics presented were the physiology of the kidney, the effects of heavy metals on the kidney, animal studies in uranium nephrotoxicity, comparisons of kidney histology in nine humans, renal effects in

uranium mill workers, renal damage from different uranium isotopes, and Canadian studies on uranium toxicity. Discussions following the presentations are included in the edited transcripts. 30 refs., 9 figs., 9 tabs.

37905 **(PNL—SA-14760) Relationship between {bar Q} defined in terms of y for 1 μm sites and initial radiation damage.** Braby, L.A.; Wilson, W.E.; Metting, N.F. (Pacific Northwest Lab., Richland, WA (USA)). Nov 1987. Contract AC06-76RL01830. 5p. (CONF-880404—11). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008196/JAW.

From 7. international congress of the International Radiation Protection Association; Sydney, Australia (10 Apr 1988).

The recent suggestion that quality factor (Q) be defined in terms of lineal energy (y) rather than LET (IN 86) requires specification of the diameter of the site to be used. Since present knowledge of the mechanisms leading to effects of radiation is insufficient to specify the exact site size, and arbitrary choice of site size must be made. A site size of one or two micrometers has been recommended because it can be simulated by tissue equivalent proportional counters, making Q a measurable quantity. However, it is not immediately obvious that y measured in a 1 μm diameter site is relevant to the biological effectiveness of different radiations. Monte Carlo track structure calculations have been used to determine the distribution of energy deposition for protons and electrons at a variety of energies in 10 nm and 1000 nm diameter sites. The results indicate that measurements using large sites can be used to provide a satisfactory estimate of energy deposition in small sites and can thus be used to predict biological effectiveness, even if the effect depends on the concentration of damage in very small sites. 6 refs., 3 figs.

37906 **(PNL-SA—15819) Evidence of lung cancer risk from animal studies.** Cross, F.T. (Pacific Northwest Lab., Richland, WA (USA)). Mar 1988. Contract AC06-76RL01830. 17p. (CONF-880329—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009488/JAW.

From 24. annual meeting of the National Council on Radiation Protection and Measurement; Washington, DC, USA (30 Mar 1988).

Human epidemiological data provide the most important basis for assessing risks of radon exposures. However, additional insight into the nature of exposure-response relationships is provided by animal experimentation and dosimetric determinations. Animal studies have now been conducted for more than 50 years to examine the levels of pollutants in underground mines that were responsible for the respiratory effects observed among miners. This work has emphasized respiratory cancer and the interaction of radon with other agents, such as ore dust, diesel-engine-exhaust fumes and cigarette smoke. The more recent data on radon-daughter inhalation exposures were provided by two American research centers, The University of Rochester (UR) and the Pacific Northwest Laboratory (PNL), and by the Compagnie Generale des Matieres Nucleaires (COGEMA) laboratory in France. Approximately 2000 mice, 100 rats and 80 dogs were employed in the completed UR studies, begun in the mid 1950s; 800 hamsters, 5000 rats and 100 dogs in the ongoing PNL studies, begun in the late 1960s; and 10,000 rats in the ongoing COGEMA studies, also begun in the late 1960s. More complete updated biological effects, data resulting from chronic radon-daughter inhalation exposures of mice, hamsters, rats and beagle dogs were examined. Emphasis on the carcinogenic effects of radon-decay product exposure, including the influences of radon-daughter exposure rate, unattached fraction and disequilibrium, and co-exposures to other pollutants. Plausible values for the radon (radon-daughter) lifetime lung-cancer risk coefficients are also provided. 13 refs., 1 fig., 1 tab.

37907 (SSA—1987-TS-8, pp 23-24) **Improvement in radioprotective activity by incorporation of compounds in carriers.** Fatome, M.; Roman, V.; Laval, J.-D. (Centre de Recherches du Service de Sante des Armees, 92 - Clamart (France)). 1987. (In French). NTIS (US Sales Only), PC A12/MF A01.

In 1986 Scientific works.

Incorporation of radioprotectors in carriers such as liposomes, microspheres and ion-exchange resins generally leads to a radioprotective activity after oral delivery and to its extension for a few hours. Their strong hydrophilicity can require some alterations of the usual techniques and can lower the stability of the preparations.

37908 **(SSA—1987-TS-8) 1986 Scientific works.** (Centre de Recherches du Service de Sante des Armees, 75 - Paris (France)). 1987. vp. NTIS (US Sales Only), PC A12/MF A01. Order Number DE88753490/JAW.

Items within the scope of EDB have been entered individually into the data base. (ACR)

37909 **(TsNIIATOMINFORM-ON—2) Evaluation of non-stochastic effects of small doses of internal irradiation at the level of entire organisms.** Dedov, V.I.; Stepanenko, V.F.; Norets, T.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow; Ministerstvo Zdravookhraneniya SSSR, Moscow. Natsional'naya Komissiya po Radiatsionnoj Zashchite). 1987. 46p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702954/JAW.

The data presented concern the estimation of nonstochastic effects including: the changes in the functional state of neuroendocrine system induced by incorporation of radionuclides emitting both γ- and Auger-electrons or β-particles (^{75}Se, ^{35}S) in quantities producing mean absorbed doses close to maximum permissible limits for non-stochastic effects (mean dose 0.5 Gy for the whole body); the influence of hormonal homeosthasis on the vital activity of irradiated organism; the influence of biological (age and sex of animal), dosimetric and microdosimetric (for Auger emitters) factors on the effects of the irradiation. The results of the examination of neuroendocrine system as a whole give evidence of serious and long-term changes in its function as a result of comparatively low mean doses of internal irradiation (0.5 Gy for the whole body). The data contradict the existing opinion of low radiosensitivity of endocrine glands examined separately. The characteristics of functional state of neuroendocrine system are used as a sensitive and informative criterion for evaluation of biological effects of small doses of internal irradiation. The examination of changes in the functioning of neuroendocrine system together with the analysis of hormonedepended processes permit to estimate the functional-capacities of irradiated organism, its activity, especially in strained conditions. 29 refs.; 4 tabs.; 6 figs.

38000 **(UCRL—94519) The next decade in external dosimetry.** Griffith, R.V. (Lawrence Livermore National Lab., CA (USA)). Oct 1986. Contract W-7405-ENG-48. 40p. (CONF-861044—11). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008905/JAW.

From 25. Hanford Life Sciences symposium: radiation protection-a look to the future - celebrating four decades of research at Hanford; Richland, WA, USA (21 Oct 1986).

As the radiation protection community moves through the last half of the '80s and into the next decade, we can expect the requirements for external dosimetry to become increasingly more restrictive and demanding. As in other health protection fields, growing regulatory and legal pressures, together with a natural evolution in philosophy, require the health physicist to display an increasing degree of accountability, rigor, and professionalism. The good news is that, for the most part, the technology necessary to solve many of the problems will be available or not far behind. This paper describes anticipated technology. 66 refs., 10 figs.

38001 **Skeletal ^{212}Pb retention following ^{224}Ra injection: extrapolation of animal data to adult humans.** Schlenker, R.A. (Argonne National Lab., IL (USA)). *Health Physics;* **54**: No. 4, 383-396(Apr 1988).

Two methods of interspecies extrapolation, one based on a correlation of skeletal ^{212}Pb/^{224}Ra with body weight, the other based on the mechanistic relationship between skeletal ^{212}Pb/^{224}Ra and reciprocal bone surface-to-volume ratio, lead to the conclusion that the retention of ^{212}Pb in the adult human skeleton is approximately complete a few days after injection. The correlation-based method gives most probable values for ^{212}Pb/^{224}Ra of 1.0 and 1.1 at 2 d and 7 d after injection, compared with values of 1.05 and

1.27 expected at these same times if the retention of ^{212}Pb were complete from the time of injection and if no ^{212}Pb were in the injection solution. The range of values corresponding to one geometric standard error on either side of the most probable value is 0.87 to 1.21 at 2 d post-injection. With the method based on the reciprocal bone surface-to-volume ratio, the best estimate of $^{212}Pb/^{224}Ra$ at 2 d after injection is 0.88, equal to the value observed in young adult beagles. An alternative interpretation of the results of this latter method leads to the conclusion that retention is complete, with $^{212}Pb/^{224}Ra$ equal to 1.0 for a ^{212}Pb-free injection solution and 1.1 for a solution containing ^{212}Pb in secular equilibrium with ^{224}Ra. This work, which uses ^{224}Ra daughter product retention data from mice, rats and dogs following 224Ra injection, provides a scientific foundation for retention assumptions made in the calculation of mean skeletal dose for adult humans. There now appear to be few uncertainties in these latter dose values, stemming from inaccurate retention assumptions; but substantial uncertainties remain in the mean skeletal dose values for juveniles and in the endosteal tissue doses regardless of age.

38002 **Chemical exposures and central nervous system cancers: a case-control study among workers at two nuclear facilities.** Carpenter, A.V.; Flanders, W.D.; Frome, E.L.; Tankersley, W.G.; Fry, S.A. (Oak Ridge Associated Universities, TN (USA)). *American Journal of Industrial Medicine;* **13**: No. 3, 351-362(1988).

In a nested case-control study of workers employed between 1943 and 1977 at two nuclear facilities, we evaluated the possible association of primary CNS cancers with occupational exposure to chemicals. Seventy-two white male and 17 white female workers who, according to the information on death certificates, died of primary CNS cancers were identified as cases. For each case, four controls were matched on race, sex, facility at which initially employed (cohort), year of birth, and year of hire. Each job title/department combination was subjectively evaluated for potential exposure to each of 26 chemicals or chemical groups. Statistically significant associations were not found between CNS cancer deaths and any of the 26 chemicals. An increased risk of CNS cancer occurrence was observed among subjects employed for more than 20 yr (OR = 7.0, 95% CI = 1.2,41.1, cases = 9).

38003 **Personnel neutron-gamma and criticality accident dosimetry in perspective.** Sims, C.S.; Swaja, R.E.; Weng, P.S. (Oak Ridge National Lab., TN (USA)). *Ho Tzu K'o Hsueh;* **24**: No. 2, 113-140(Apr 1987). Contract AC05-84OR21400.

This is a review article based on several intercomparison studies and training courses on personnel dosimetry and criticality accident dosimetry held at the Oak Ridge National Laboratory. The main topics to be dealt with are (1) personnel neutron dosimetry, (2) dose equivalent estimation for neutrons, (3) neutron dosimeter calibration, (4) gamma monitoring in mixed fields, (5) dosimetry accreditation programs in the US, (6) criticality accident dosimetry, and (7) conclusions. 27 references, 6 figures, 12 tables.

38004 **Role of repair processes in neoplastic transformation induced by ionizing radiation in C3H/10T1/2 cells.** Hill, C.K.; Elkind, M.M.; Han, A. pp 379-398 of Mammalian cell transformation: Mechanisms of carcinogenesis and assays for carcinogens. Barrett, J.C.; Tennant, R.W. New York, NY; Raven Press (1985).

In this contribution the authors discuss only the elucidation of mechanisms underlying the induction and modulation of neoplastic transformation by the type and mode of radiation delivery. There is ample evidence that ionizing radiations are oncogenic, for example, the excess tumors appearing among the survivors at Hiroshima and Nagasaki. However, the processes involved in the production of tumors are still not clearly understood despite much research into the damage produced by radiation. In what follows the authors describe those features of transformation in vitro that they believe to be characteristic of the inducing agent, ionizing radiation; these features are also present in the process of tumor induction in rodents by radiation. Because the biophysics of the induction process by radiation differs in several fundamental ways from that connected with transformation induced by chemicals or viruses, radiation studies may provide insights into mechanisms that may be unique. However, for such studies, strict control and consistency must be present in the assay system to ensure reproducible results. So, first they deal with some biological factors that determine the consistency of the assay.

38005 **(DP—1739-7) Comprehensive Cooling Water Study: Volume 7, Ecology of Par Pond, Savannah River Plant: Final report.** Wilde, E.W. (ed.). (Savannah River Lab., Aiken, SC (USA)). Oct 1987. Contract AC09-76SR00001. 227p. NTIS, PC A11/MF A01;1; GPO Dep. Order Number DE88010407/JAW.

The Comprehensive Cooling Water Study (CCWS) was initiated in 1983 to evaluate the environmental effects of the intake and release of cooling water on the structure and function of aquatic ecosystems at the Savannah River Plant. The initial report (Gladden et al., 1985) described the results from the first year of the study. This document is the final report and concludes the program. The report comprises eight volumes. The first is a summary of environmental effects. The other seven volumes address water quality, radionuclide and heavy metal transport, wetlands, aquatic ecology, Federally endangered species, ecology of Par Pond, and waterfowl. 222 refs., 31 figs., 67 tabs.

38006 **(AD-A—189938/4/XAB) Teratogenicity, mutagenicity, and effects of Grade 2 diesel fuel on reproduction in a single generation of rats. Technical report, October 1979-July 1980.** Starke, W.C.; Pellerin, R.J.; Burnett, D.C.; Manthei, J.H.; Heitkamp, D.H. (Chemical Research, Development and Engineering Center, Aberdeen Proving Ground, MD (USA)). Oct 1987. 28p. (CRDEC-TR—87083). NTIS, PC A03/MF A01.

Pregnant dams were exposed to DF-2 smoke, of tank exhaust for 1 hr and to noise from the tank's engine for 20-30 sec. One litter in the DF-2 smoke group had three fetuses with major, gross malformations and two with visceral abnormalities. The DF-2 smoke group also showed the greatest number of fetuses with sites of low bone ossification. Males in the DLM study and the males and females in the single-generation (SG) reproduction study were exposed to DF-2 smoke or exhaust for 15 or 60 min. Unexposed dams were mated to DLM males from the 15-min exhaust group during the males' second week of post-exposure. These females had significantly more resorptions than the noise controls for the same mating period. The major malformations observed in the teratology study occurred in rather isolated instances. Retarded bone ossification was indicated in the DF-2 smoke group but without significantly lower body weights. Nothing indicates that DF-2 smoke caused fetal-growth retardation. Observances in the DLM study were not strong enough to suspect a mutational effect, and the observations in the SG study gave no support for adverse effects on reproduction.

38007 **(AD-A—190412/7/XAB) Evaluation of the acute toxicity of a synthetic polyalphaolefin-based hydraulic fluid. Technical report, June 1986-May 1987.** Kinkead, E.R.; Culpepper, B.T.; Henry, S.S.; Pollard, D.L.; Kimmel, E.C. (Northrop Services, Inc./Environmental Sciences, Dayton, OH (USA)). Nov 1987. 37p. NTIS, PC A03/MF A01.

In contingency planning for alternative hydraulic fluids in the event that critical shortages should occur in the supply of petroleum based fluids, the US Navy has investigated various synthetic compounds including polyalphaolefins. Earlier toxicity assessments (1983) on five formulations of polyalphaolefin hydraulic fluids and a base fluid indicated that one formation (N501) was toxic via inhalation. This material was reformulated (now designat-

ed B85-174) and retested along with its base polyalphaolefin (R-1061-3). The LC50 values for the reformulated hydraulic fluid B85-174 were 1.60 and 1.37 mg/L for male and female rats, respectively. Nor was the material irritating to the skin or eyes of treated rabbits. Similar results were obtained from tests on the base polyalphaolefin used for comparison. In contrast, the previous base material demonstrates con inhalation toxicity. THe 1983 and 1986 polyalphaolefin base materials were obtained form different suppliers and infrared analysis demonstrated compositional differences.

38008 **(AD-A—190413/5/XAB) Evaluation of the acute toxicity of four water-in-oil emulsion hydraulic fluids. Technical report, July 1986-April 1987.** Kinkead, E.R.; Culpepper, B.T.; Henry, S.S.; Pollard, D.L.; Kimmel, E.C. (Northrop Services, Inc./Environmental Sciences, Dayton, OH (USA)). Nov 1987. 45p. NTIS, PC A03/MF A01.

As a part of the Submarine Damage Prevention program, four commercial water-in-oil emulsion class of compounds consists of stable emulsions of micronic or submicronic water droplets suspended in a high-quality petroleum-base oil. These fluids also contain special additives to give the final product lubricity, corrosion-protection properties, emulsion stabilizers, and resistance to bacterial and fungal growth. The most significant exposure routes for hydraulic fluids are expected to be dermal, due to spills or leaks, and aerosol inhalation, from pressurized-system leaks. The studies conducted included eye and skin irritation, skin sensitization, oral and dermal toxicity, and aerosol inhalation. They also provided data to compare the short-term exposure effects of these various emulsions. None of the testbed compounds were toxic by the oral or dermal routes of administration. The viscous nature of these emulsions were limited to aerosol concentrations that could be tested. At the maximum attainable concentrations, no deaths or toxic effects were noted in the exposed animals. All of the materials were mildly irritating to the eyes but not on the skin. One of the materials testbed had a slight potential to sensitize treated animals.

38009 **(AD-A—190430/9/XAB) Effects of CW (chemical warfare)-related chemicals on social behavior and performance. Annual report, 30 September 1984-29 September 1985.** Bunnell, B.N.; Iturrian, W.B. (Georgia Univ., Athens (USA)). 1 Oct 1985. 57p. NTIS, PC A04/MF A01.

This report summarizes work accomplished in the second year of a three-year project aimed at developing a battery of tests of social behavior and performance that wil be sensitive to the effects of chemical warfare-related chemicals considered for use as antidotes or prophylactics against chemical-warfare agents. Procedures for assessing social behavior in nonhuman primates are described and compared. Performance scores on three operant schedules, a test of complex problem solving, and behavior in a novel environment are presented and correlations between the social and performance variables are examined. The effects of atropines on several of the social and performance measures are reported as are data from plasma hormone assays for cortisol and prolactin.

38010 **(AD-A—190431/7/XAB) Effects of CW (chemical warfare)-related chemicals on social behavior and performance. Annual report, 30 September 1983-29 September 1984.** Bunnell, B.N.; Iturrian, W.B. (Georgia Univ., Athens (USA)). 1 Oct 1984. 69p. NTIS, PC A04/MF A01.

This report summarizes work accomplished in the first year of a three-year project aimed at developing a battery of tests of social behavior and and performance that will be sensitive to the effects of chemical warfare-related chemicals considered for use as antidotes or prophylactics against chemical-warfare agents. Procedures for assessing social behavior in nonhuman primates are described and compared. The presence and absence of correlations between social behavior and performance on two operant schedules, a test of complex problem solving, and behavior in a novel environment are reported as are the effects of caffeine (as a control) and atropine on the social and performance variables.

38011 **(AD-A—190532/2/XAB) Comparative study regarding the association of alpha-2U globulin with the nephrotoxic mechanism of certain petroleum-based Air Force fuels. Final report, 1 September 1986-31 August 1987.** Eurell, T.E. (Illinois Univ., Urbana (USA). Dept. of Veterinary Biosciences). 27 Oct 1987. 14p. NTIS, PC A03/MF A01.

Alpha-2U globulin is a low-molecular-weight urinary protein which may be associated with a hydrocarbon-induced proximal tubular cell degeneration in the male rat kidney. A new method was developed to obtain monospecific immunologic reagents for alpha-2U globulin using diafiltration, anion exchange and hydroxylapatite chromatography. Isoelectric focusing techniques were developed to isolate the major isoelectric variants of the alpha-2U globulin molecule and to assess changes in alpha-2U globulin after experimental exposure to hydrocarbon compounds. Alpha-2U globulin was isolated from the urine of albino and pigmented male rats to study strain susceptibility to the nephrotoxic process. An alpha-2u globulin isoelectric variant profile distinguishing albino from non-albino male rats was not apparent, however, strain differences were revealed. Fischer 344 male rats appear to have higher levels of the isoelectric variants than the other strains studied. These findings suggest that if a strain susceptibility to the hydrocarbon-induced nephrotoxic lesion exists, it may be associated with the alpha-2U globulin isoelectric variant profile.

38012 **(AD-A—190750/0/XAB) Use of lanthanum to detect changes in the permeability barrier of rat skin after dermal exposure to organic chemicals.** Mattie, D.R.; McDougal, J.N.; Chase, M.R.; Hixson, C.J. (Air Force Aerospace Medical Research Lab., Wright-Patterson AFB, OH (USA)). 1987. 3p. (AAMRL-TR—87-076). NTIS, PC A02/MF A01.

Pub. in Proceedings of the Annual Meeting of the Electron Microscopy Society of America (45th), 870-871(1987).

Occupational dermal exposures to organic solvents are of importance due to local effects in the skin and systematic toxicity if penetration occurs through the skin. Repeated or prolonged contact with organic solvents have been shown to penetrate the skin; little information is available however, concerning effects on the barrier properties of skin after dermal exposure to solvents. This investigation examines the ultrastructural changes in rat skin after exposure of 3 organic chemicals and to correlate changes with the location of an electron-dense tracer, lanthanum, which is normally excluded by the permeability barrier in the stratum corneum. Male rats were exposed for 24 h to sterile saline, trichloroethylene (TCE), perchloroethylene (PERC), or toluene using dermal-exposure cells developed in this laboratory. Rat skin exposed to saline for 24 h appeared normal. Rat skin exposed to neat TCE, PERC or toluene for 24 h caused acute, coagulative necrosis of the epidermis and upper 1/2 to 1/3 of the dermis.

38013 **(BFR-R—69-1986) Air quality in private dwellinghouses. A study of need related ventilation.** Loegdberg, A.; Adling, A. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 27p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752886/JAW.

The requirements laid down in the Swedish Building Code (SBN) regarding the ventilation of dwellings do not produce an acceptable air quality in bedrooms if the comfort requirements which should apply regarding relative humidity and carbon dioxide content in the room air are taken into consideration. One easy and inexpensive way in which an improvement can be brought about is to install extraction terminals in bedrooms also. A reduction in the total air change rate of the building to about 0.3 per hour which will result in a not inconsiderable saving in energy, is possible at the same time. Measurements of air change rates have been made, using both tracer gas and hot wire anemometer, in buildings equipped with extraction terminals in the bedrooms and in reference buildings of the same type. The reference buildings have a traditional ventilation system with extraction terminals in all /sup w/et/sup /rooms, clothes cupboard and kitchen. In both cases outside air is admitted into the buildings through slot valves in the window frames. The results in the investigations show that indoor climate in the bedrooms is considerably better when extraction terminals are installed in the bedrooms than when air is extracted in the traditional way. No moisture or mould problems have been found and, what is more important, the occupants consider the indoor climate to be good.

38014 (BFR-R—79-1986) Chemicals in mechanical heat pumps. Environmental aspects and health hazards. Engzell, R. (Statens Raad foer Byggnadsforskning, Stockholm (Sweden)). 1986. 19p. (In Swedish). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752889/JAW.

In its background description, this report describes the principles of mechanical heat pumps, data on the present market for heat pumps in Sweden, chemicals used in mechanical heat pumps and the known environmental effects and health hazards to persons working on such equipment. The report also describes handling of the chemicals before and after use in mechanical heat pumps, together with methods of tracing and measuring leakage of working media. The report indicates that there is a need for further research, and presents a proposal for a research program intended to ascertain the effects of large mechanical heat pumps on the environment. The program proposal includes suggestions for dealing with the problem of tracing and handling leakage of working media into the air, and of handling and final disposal of chlorinated fluorocarbons from mechanical heat pumps. The proposal also includes a survey of basic work already carried out on existing heat pump plants, and a comparison of them with an ideal plant, together with an assessment of the differences.

38015 (BNL—40979) Health and safety aspects of new photovoltaic cell manufacturing technologies. Fthenakis, V.M.; Moskowitz, P.D.; Hamilton, L.D. (Brookhaven National Lab., Upton, NY (USA)). Sep 1987. Contract AC02-76CH00016. 18p. (CONF-871113—7). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007551/JAW.

From American Institute of Chemical Engineers annual meeting; New York, NY, USA (15 Nov 1987).

Production of thin-film photovoltaic cells entails extensive handling of toxic (e.g., AsH_3, PH_3, H_2Se), and flammable or explosive (e.g., SiH_4, H_2) materials. Large scale manufacture of these photovoltaic cells may present potential health and safety hazards to workers and the public. Consequently, analysis of these hazards is required before full commercialization, so that alternative strategies may be developed, safety controls may be incorporated in the initial design, control costs reduced and health risks minimized. In this paper hazards to occupational and public health related to the toxicity and explosiveness of several feedstock gases are evaluated. The largest hazards are posed by accidental gas releases from storage or process systems. The most efficient way to reduce these hazards is to prevent accident initiating events through choice of inherently safer technology and material, appropriate design and construction, and administrative options. If an accidental release happens, engineering (e.g., flow restrictors, scrubbers) and administrative (e.g., emergency response) risk reducing measures will be needed. 13 refs., 1 fig., 5 tabs.

38016 (BNL—40988) Improving health-related monitoring, data collection, and associated analysis for diseases related to environmental pollution. Morris, S.C. (Brookhaven National Lab., Upton, NY (USA)). Nov 1987. Contract AC02-76CH00016. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007753/JAW.

This report describes specific improvements which can be made to existing health-related monitoring, data collection and analysis to provide better information on environment-health linkages and to better support decision-making on allocation of resources and trained personnel. The improvements considered include (1) Closer coordination among monitoring of disease, health status and environmental pollution; (2) New concepts of environmental monitoring specifically oriented to population exposure rather than ambient environmental levels; (3) New concepts of exposure monitoring oriented to total environmental exposure, rather than independent estimates of exposure and effect; (5) Direct surveillance of human populations; (6) Measurement of exposure co-factors; (7) Measurement of genetic and constitutional co-factors; (8) Standardizing health and census data; (9) Coupling of socio-economic measures with environmental and health measures; (10) Collection of morbidity information on environment-related diseases not now generally reported; (11) Baseline geochemistry measurements and monitoring of body burdens of pollutants in the populations; (12) Epidemiological surveillance; (13) Coordinated occupational exposure monitoring and occupational registers; (14) Monitoring and follow-up of environmental emergencies; and (15) Improvement of modeling, analytical, and display techniques to relate population health data with environmental exposures. 22 refs.

38017 (CONF-870524—4) Serum lipid levels in neighboring communities with chlorinated and nonchlorinated drinking water. Zeighami, E.A.; Watson, A.P.; Craun, G.F. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 24p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011830/JAW.

From 6. conference on water chlorination: environmental impact and health effects; Oak Ridge, TN, USA (3 May 1987).

The Wisconsin Heart Health Research Program was designed to ascertain levels of serum lipids and other clinical parameters among residents of a total of forty-six neighboring small communities in central Wisconsin. The purpose of the study was to determine whether distribution of serum lipids, blood pressure or thyroid hormones differed according to the chlorination of the water supply, or to the calcium and magnesium content (hardness) of the drinking water supply. This report examines the relationship of chlorination and water calcium to estimated community mean serum lipid levels. The estimated community means are adjusted for potential confounders, including age, education level, alcohol intake, smoking, dietary fat and dietary calcium. Serum cholesterol levels proved to be significantly higher in chlorinated communities for females. Levels of serum cholesterol were also higher in chlorinated communities for males, but differences were considerably smaller and not statistically significant. Low-density lipoprotein cholesterol levels were also higher in chlorinated communities for females ($p = .06$). Levels of high-density lipoprotein (HDL) cholesterol were higher in hard water communities than in soft water communities, although the p-value for the hardness term did not quite reach significance at $p < .05$ in either model. The regression of community mean HDL levels on both drinking water calcium and magnesium levels was positive, indicating increasing mean HDL levels with increasing calcium and/or magnesium content in the drinking water.

38018 (CONF-880313—1) General theoretical approach to dose response modeling - implications for risk assessment. Walsh, P.J.; Jones, T.D. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 22p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012208/JAW.

From International life science symposium; Knoxville, TN, USA (20 Mar 1988).

The major point of this discussion is that it is unlikely that there exists a unique dose response relationship even for the simple case of a single toxic material in a single biological system. Different dose response relationships can be produced by varying the dose rate (which affects cellular alteration and killing rates) as related to cellular dynamics (turnover time) and repair rates. Thus, in extrapolation from high dose, high dose rate conditions, not only the magnitude of variables but also the fundamental nature of the dose response is being changed. In the general case, one must at least consider an n-dimensional dose response surface rather than a single curve presented in only 2 dimensions.

38019 (CONF-880558—8) Acute toxicity of uranium hexafluoride, uranyl fluoride and hydrogen fluoride. Just, R.A. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 4p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010138/JAW.

From Uranium hexafluoride--safe handling, processing, and transporting conference; Oak Ridge, TN, USA (24 May 1988).

Uranium hexafluoride (UF_6) released into the atmosphere will react rapidly with moisture in the air to form the hydrolysis products uranyl fluoride (UO_2F_2) and hydrogen fluoride (HF). Uranium compounds such as UF_6 and UO_2F_2 exhibit both chemical toxicity and radiological effects, while HF exhibits only chemical toxicity. This paper describes the development of a methodology for assessing the human health consequences of a known acute exposure to a mixture of UF_6, UO_2F_2, and HF. 4 refs., 2 figs., 5 tabs.

38020 **(DOE/ER/60151—T1) Trace metal and trace organic detoxification in marine organisms: Final report.** Jenkins, K.D. (California State Univ., Long Beach (USA). Molecular Ecology Inst.). 20 Jun 1986. Contract AC03-83ER60151. 3p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008561/JAW.

We have examined the underlying mechanisms of subcellular copper and cadmium metabolism in larvae of the mud crab, Rhithropanopeus harrisii, and the polychaete worm, Neanthes arenaceodentata. In developing crab larvae we found that Cu accumulation is precisely regulated at lower exposures. At exposures higher concentrations than those normally found in the estuary from which the organisms were collected, however, Cu regulation appears to break down and Cu accumulates on metallothionein (MT) and very low molecular weight (VLMW) ligands. Larval growth rates were found to be significantly reduced when Cu accumulation in the MT pool exceed the half saturation constant (km). Accumulation of Cu in the VLMW pool was also highly correlated with reduced larval growth.

38021 **(EPRI-EA—5820) Effects of food and water quality on culturing and toxicity testing of Ceriodaphnia dubia: Final report.** Cooney, J.D.; DeGraeve, G.M.; Moore, E.L.; Palmer, W.D.; Pollock, T.L. (Battelle Columbus Div., OH (USA)). May 1988. 193p. Research Reports Center, Box 50490, Palo Alto, CA 94303. Order Number TI88010640/JAW.

Effects of Food and Water Quality on Culturing and Toxicity Testing of Ceriodaphnia dubia. Tests of eight diets for culturing Ceriodaphnia have identified two foods that support high and consistent survival and reproduction. Use of these foods can contribute to the precision of EPA recommended effluent toxicity tests.

38022 **(EUR—10704-EN) Biological indicators for the assessment of human exposure to industrial chemicals.** Alessio, L.; Berlin, A.; Boni, M.; Roi, k. (Commission of the European Communities, Luxembourg. Directorate General Telecommunications, Information Industries and Innovation; Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1987. 86p. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Industrial health and safety.

The original title of the first volume of the series 'Human Biological Monitoring of Industrial Chemicals Series' was changed in the second volume and this change is now further justified by the four monographs making up the third volume: alkyl lead compounds, dimethylformamide, mercury and organophosphorus pesticides. Separate abstracts were prepared for 2 chapters (alkyl lead compounds and mercury).

38023 (EUR—10704-EN, pp 3-15) **Alkyl lead compounds.** Alessio, L.; Dell'Orto, A.; Forni, A. 1987. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Industrial health and safety.

In Biological indicators for the assessment of human exposure to industrial chemicals.

The main route of absorption of alkyl lead compounds is via the respiratory tract but the skin, too, offers an excellent penetration route for both tetraethyl lead (TEL) and tetramethyl led (TEM). The toxic effects of alkyl lead compounds involve mainly the central nervous system. Only slight alterations in heme synthesis have been demonstrated, which contrasts with the situation in the case of inorganic lead. Lead in urine (PbU) is at present the only biological indicator that can be used for assessment of occupational exposure to organic lead compounds.

38024 (EUR—10704-EN, pp 29-46) **Mercury.** Foa, V.; Bertelli, G. 1987. Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

Industrial health and safety.

In Biological indicators for the assessment of human exposure to industrial chemicals.

Mercury is mainly eliminated with the urine. Determination of mercury in urine is at present the most widely used indicator of exposure; values calculated on a group basis were found to be well correlated with the environmental concentrations. However, the correlations can be established only after about one year from the beginning of exposure, when the binding sites in the kidney are saturated. It should be borne in mind that although HgU is an indicator of exposure, it does not permit evaluation of the dose in the critical organ (central nervous system). Fewer studies have been made on the behaviour of HgB. It has been found that the levels of this indicator are correlated with the levels of HgU in occupationally exposed subjects. At present no biological tests are available that can be used for evaluation of early reversible effects due to mercury. Due to the high toxicity of organic mercury compounds, especially alkyl mercurials, their use in industry has been banned in many countries. Non-occupational exposure to these compounds, via ingestion of contaminated food, does, however, occur to a considerable extent. The digestive apparatus is the most effective route of absorption and elimination occurs via the faeces. Organic mercury compounds easily cross the blood-brain barrier causing serious alterations to the central nervous system. The measurement of HgB is a useful test for evaluating the degree of exposure, but measurement of HgU is of no practical use. No indicators of early biological effect exist for alkyl mercury compounds.

38025 (INIS-mf—11233, pp 37) **Chelate-induced changes in metal disposition: studies on dithiocarbamates, pyridinethiones, xanthates and dithiophosphates in rodents and in fishes.** Tjaelve, H.; Jasim, S.; Gottofrey, J.; Borg, K. (Swedish Univ. of Agricultural Sciences, Uppsala). 1987. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88702880/JAW. (CONF-8708259—).

From 2. international symposium on chelating agents in pharmacology, toxicology and therapeutics; Pilsen, Czechoslovakia (12 Aug 1987).

38026 **(Juel-Spez—413) Status seminar on the BMFT research project 'Research into the causes of forest decline'. Proceedings.** Stuettgen, E. (comp.). (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Projektleitung Biologie, Oekologie, Energie). Aug 1987. 363p. (In German). (CONF-8703265—). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW.

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

During 31st March - 3rd April 1987 the 'Project Management for Biology, Ecology, Energy' in the Nuclear Research Centre Juelich organized on behalf of the Federal Ministry of Research and Technology (BMFT) a seminar concerning 'Research into the causes of forest decline'. Results of 95 projects funded by the BMFT were presented by poster presentations on the following topics: Deposition of pollutants, immission; symptoms of damage, inventory (remote sensing) wood increment, wood quality; effects on above parts of trees, physiology; soil chemistry, assessment of nutrient situation (fertilization trials); soil biology, root/soil-rhizosphere interactions; epidemiology and modelling. Research results concerning the mentioned topics as well as an evaluation of the results are reported. Separate records are available for 106 papers in this report.

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38059 (Juel-Spez—413, pp 117-118) **Analyses of the methodology of large-area forest damage inventories and damage progress by remote monitoring and combined remote and field monitoring. Part project 1. Combined remote and field monitoring.** Hildebrandt, G.; Tepasse, P. (Freiburg Univ. (Germany, F.R.). Abt. fuer Luftbildmessung und Fernerkundung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38060 (Juel-Spez—413, pp 119-121) **Aalyses of the methodology of large-area forest damage inventories and damage progress by remote monitoring and combined remote and field monitoring. Pt. 2.** Kadro, A. (Freiburg Univ. (Germany, F.R.). Abt. fuer Luftbildmessung und Fernerkundung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38061 (Juel-Spez—413, pp 122) **Large-area diagnosis and monitoring of forest damage using multispectral scanner data for the Frankfurt city forest.** Schramm, M. (Institut fuer Planungsdaten in der Stadt- und Regionalforschung und Oekologie G.m.b.H., Offenbach am Main (Germany, F.R.)). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38062 (Juel-Spez—413, pp 124-145) **Damage symptoms, inventory (remote monitoring), wood growth rates, wood quality.** Ammer, U.; Kenneweg, H. Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38063 (Juel-Spez—413, pp 152-153) **Susceptibility to infestation with needle-biting insects of spruce from forests with different damage rates.** Schopf, R. (Goettingen Univ. (Germany, F.R.). Inst. fuer Forstzoologie). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38064 (Juel-Spez—413, pp 154-156) **Effects of sulphur compounds and ozone on plant growth and development.** Schaub, H. (Frankfurt Univ. (Germany, F.R.). Botanisches Inst.). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38065 (Juel-Spez—413, pp 157) **Comparative investigations of the effects of gaseous pollutants on terpene emissions from spruce and pines in different sites and in climate chambers.** Schaub, H. (Frankfurt Univ. (Germany, F.R.). Botanisches Inst.). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38066 (Juel-Spez—413, pp 158-160) **Effects of acid rain on the barrier function of plant cuticles.** Lendzian, K.J. (Technische Univ. Muenchen (Germany, F.R.). Lehrstuhl fuer Botanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38067 (Juel-Spez—413, pp 161-162) **Effects of acid fog on washout of nutrient ions and carbohydrates of young spruce and on the development of damage symptoms.** Mengel, K.; Breininger, M.T.; Lutz, H.J. (Giessen Univ. (Germany, F.R.). Inst. fuer Pflanzenernaehrung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38068 (Juel-Spez—413, pp 163-164) **Analysis of alkylated lead compounds in precipitations and leaves, and investigations of the toxic effect of triethyl lead.** Faulstich, H. (Max-Planck-Institut fuer Medizinische Forschung, Heidelberg (Germany, F.R.)). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38069 (Juel-Spez—413, pp 165-167) **Investigation of the effects of airborne ozone on young and older spruce and beech.** Kettrup, A. (Paderborn Univ. (Gesamthochschule) (Germany, F.R.)). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38070 (Juel-Spez—413, pp 168-169) **Effects of pollutants on the primary processes of photosynthesis.** Renger, G.; Graeber, P. (Technische Univ. Berlin (Germany, F.R.). Max-Volmer-Institut fuer Biophysikalische und Physikalische Chemie). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38071 (Juel-Spez—413, pp 170-171) **Investigations of pollution damage in the Frankfurt city forest with particular regard to car engine emissions. Effects of air pollution under the aspects of ecology and vegetation science.** Gies, T.; Braun, H.; Kuechler, A. v. (Frankfurt Univ. (Germany, F.R.). Zentrum fuer Umweltforschung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38072 (Juel-Spez—413, pp 172-173) **CO_2 and H_2O gas change by beech trees in the Solling hills as an indicator of latent pollution effects.** Runge, M. (Goettingen Univ. (Germany, F.R.). Lehrstuhl fuer Geobotanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38073 (Juel-Spez—413, pp 174-176) **Carbon, nutrient and water metabolism of young spruce forests in the Fichtelgebirge mountains.** Schulze, E.D.; Oren, R.; Zimmermann, R.; Meyer, J.; Werk, K.S. (Bayreuth Univ. (Germany, F.R.). Lehrstuhl Pflanzenoekologie). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38074 (Juel-Spez—413, pp 177-179) **Early detection of air pollution damage in trees on the basis of volatile hydrocarbon emissions.** Rennenberg, H. (Koeln Univ. (Germany, F.R.). Botanisches Inst.). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38075 (Juel-Spez—413, pp 180) **Spring sap analyses in damaged and healthy trees.** Eschrich, W. (Goettingen Univ. (Germany, F.R.). Inst. fuer Forstbotanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38076 (Juel-Spez—413, pp 181-182) **Health status of beech trees: Is it a function of natural seasonal slug discharge?.** Essiamah, S.; Eschrich, W.; Fromm, J.; Schneider, E. (Goettingen Univ. (Germany, F.R.). Inst. fuer Forstbotanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38077 (Juel-Spez—413, pp 183-184) **Comparative gas change measurements on diseased trees in pure air and natural site air for a quantitative determination of primary damage.** Koch, W. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Forstbotanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38078 (Juel-Spez—413, pp 185-187) **Analysis of immission effects in selected substances in, and on, coniferes.** Schulten, H.R.; Rump, H.H. (Institut Fresenius Chemische und Biologische Laboratorien G.m.b.H., Taunusstein-Neuhof (Germany, F.R.)). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38079 (Juel-Spez—413, pp 188-189) **Combined effects of SO_2 and ozone on the assimilation apparatus of spruce and fir of different constitution. A contribution to the discussion of the immission hypothesis.** Gross, K. (Freiburg Univ. (Germany, F.R.). Waldbau-Institut). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38080 (Juel-Spez—413, pp 190-191) **Terpene concentrations and emissions of needles with different pollution levels.** Ziegler, H. (Technische Univ. Muenchen (Germany, F.R.). Lehrstuhl fuer Botanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38081 (Juel-Spez—413, pp 192-193) **Measurement of physiological data as a means of assessing the damaging effect of site-specific, organic and inorganic airborne substances on trees in a given site.** Doerffling, K. (Hamburg Univ. (Germany, F.R.). Inst. fuer Allgemeine Botanik und Botanischer Garten). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38082 (Juel-Spez—413, pp 194-195) **Investigation of photosynthesis damage in forests using in-vivo chlorophyll fluorescence.** Ernst, V. (Hannover Univ. (Germany, F.R.). Inst. fuer Biophysik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38083 (Juel-Spez—413, pp 196-197) **Electron microscope investigations of the accumulation and effects of airborne organic pollutants in leaves.** Kristen, U. (Hamburg Univ. (Germany, F.R.). Inst. fuer Allgemeine Botanik und Botanischer Garten). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38084 (Juel-Spez—413, pp 198-199) **Chlorosis phenomena resulting from a lack of nutrients or iron, partly induced by heavy metals; methods of measuring the light dependence and extent of chlorosis phenomena.** Schlote, F.W.; Tuecks, M.T.; Rayermann, M.; Langenbach, B.; Hiller, B.; Buhren, D. (Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl und Inst. fuer Biologie 2 (Zoologie)). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38085 (Juel-Spez—413, pp 200-201) **Photosynthesis and ion status as stress parameters in Fagus sylvatica.** Huettermann, A. (Goettingen Univ. (Germany, F.R.). Inst. fuer Forstbotanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38086 (Juel-Spez—413, pp 202-229) **Summary and validation of results: Surface induction, pathway, physiological aspects of stress and metabolism.** Prinz, B.; Schaub, H. Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38087 (Juel-Spez—413, pp 230-232) **Biochemical analysis of soil and of the root and leaf physiology as indicators of pollution in forest ecosystems.** Huettermann, A. (Goettingen Univ. (Germany, F.R.). Inst. fuer Forstbotanik). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38088 (Juel-Spez—413, pp 233-236) **Heavy metal accumulation, aluminium release, and delayed forest litter decomposition in the soil below older beech exposed to water running from the tree trunk; vegetation effects.** Glavac, V. (Kassel Univ. (Gesamthochschule) (Germany, F.R.). Arbeitsgruppe fuer Pflanzen-, Vegetations- und Landschaftsoekologie). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38089 (Juel-Spez—413, pp 237) **Water, nutrient and pollutant dynamics of characteristic soils of Schleswig-Holstein. Summary.** Blume, H.P.; Lamp, J. (Kiel Univ. (Germany, F.R.). Inst. fuer Pflanzenernaehrung und Bodenkunde). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38090 (Juel-Spez—413, pp 238) **Water, nutrient and pollutant dynamics of characteristic soils of Schleswig-Holstein. Validation of results.** Blume, H.P.; Lamp, J. (Kiel Univ. (Germany, F.R.). Inst. fuer Pflanzenernaehrung und Bodenkunde). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38091 (Juel-Spez—413, pp 239-242) **Effects of acid precipitations on damaged and undamaged forest ecosystems; tests of forestry measures for tree protection.** Evers, F.H. (Forstliche Versuchs- und Forschungsanstalt Baden-Wuerttemberg, Freiburg im Breisgau (Germany, F.R.)). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38092 (Juel-Spez—413, pp 243-246) **Type, concentrations and function of buffer systems in soils: a. in surface horizons, b. in mineral soil.** Naetscher, L.; Suesser, P.; Schwertmann, U. (Technische Univ. Muenchen, Freising (Germany, F.R.). Lehrstuhl fuer Bodenkunde). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38093 (Juel-Spez—413, pp 247) **Type, concentrations and function of buffer systems in soils of the Fichtelgebirge.** Naetscher, L.; Suesser, P.; Schwertmann, U. (Technische Univ. Muenchen, Freising (Germany, F.R.). Lehrstuhl fuer Bodenkunde). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38094 (Juel-Spez—413, pp 248-251) **Sulphur concentrations and types of binding in southern German forest soils as a function of atmogenic sulphur deposition.** Rehfuess, K.E.; Fischer, M. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Bodenkunde). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38095 (Juel-Spez—413, pp 252-253) **Mobilisation, complexing, and translocation of Al and heavy metal ions in forest soil under the influence of atmogenic acidification.** Kreutzer, K.; Schierl, R. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Bodenkunde). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38096 (Juel-Spez—413, pp 254-258) **Water, nutrient, and pollutant dynamics of polluted granite, phyllite, slate and basalt soils in higher altitudes in North Eastern Bavaria.** Horn, R.; Zech, W. (Bayreuth Univ. (Germany, F.R.). Lehrstuhl fuer Bodenkunde und Bodengeographie). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38097 (Juel-Spez—413, pp 259) **Testing of suitable fertilizers (especially Mg, lime, and Ca) to counteract nutrient depletion induced by forest damage.** Sturm, H.; Buchner, A.; Isermann, K. (BASF A.G., Limburgerhof (Germany, F.R.). Landwirtschaftliche Versuchsstation). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38098 (Juel-Spez—413, pp 260-262) **S, N, and heavy metal transfer between ecosystem components, distribution in ecosystem compartments, and (in)direct effects on organisms.** Schlichting, E. (Hohenheim Univ., Stuttgart (Germany, F.R.). Inst. fuer Bodenkunde und Standortslehre; Tuebingen Univ. (Germany, F.R.). Inst. fuer Geologie). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38099 (Juel-Spez—413, pp 263-266) **Diagnostic fertilisation experiments in immission-damaged forest ecosystems.** Zoettl, H.W.; Huettl, R. (Freiburg Univ. (Germany, F.R.). Inst. fuer Bodenkunde und Waldernaehrungslehre). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38100 (Juel-Spez—413, pp 267-268) **Effects of the ion status of leaves and needles on their stress physiology.** Beese, F.; Waraghai, A.; Woehler, I. (Goettingen Univ. (Germany, F.R.). Inst. fuer Bodenkunde und Waldernaehrung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38101 (Juel-Spez—413, pp 269-275) **Development in space and time of chemical parameters of soil and roots in acid sites of the Hils mountains.** Raben, G.H.; Ulrich, B. (Goettingen Univ. (Germany, F.R.). Inst. fuer Bodenkunde und Waldernaehrung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38102 (Juel-Spez—413, pp 276) **Space/time patterns of chemical stress indicators in different forest soils.** Ulrich, B. (Goettingen Univ. (Germany, F.R.). Inst. fuer Bodenkunde und Waldernaehrung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38103 (Juel-Spez—413, pp 277-278) **Rates of deposition, accumulation and discharge of toxic airborne pollutants as a measure of pollution and pollution resistance of forest ecosystems.** Ulrich, B. (Goettingen Univ. (Germany, F.R.). Inst. fuer Bodenkunde und Waldernaehrung). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38104 (Juel-Spez—413, pp 279-305) **Introduction to, and outline of, part F: Soil chemistry, nutrient metabolism (including amelioration measures).** Rehfuess, K.E.; Ulrich, B. (Muenchen Univ. (Germany, F.R.). Lehrstuhl fuer Bodenkunde). Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

From Status seminar on a BMFT research project: research into the causes of forest decline; Juelich, F.R. Germany (30 Mar 1987).

38105 (Juel-Spez—413, pp 306-307) **Root analyses in polluted beech forests.** Roehrig, E. Aug 1987. (In German). NTIS (US Sales Only), PC A16/MF A01. Order Number DE88753372/JAW. (CONF-8703265—).

38123 **(ORAU—88/B-63) Research participation programs at the National Center for Toxicological Research: FY1987 Annual report.** (Oak Ridge Associated Universities, Inc., TN (USA)). Feb 1988. Contract AC05-76OR00033. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009039/JAW.

In 1985, after negotiations spanning several years, an interagency agreement between the US Food and Drug Administration(FDA) and the US Department of Energy (DOE) established the Oak Ridge Associated Universities (ORAU) Postgraduate Research Program at the National Center for Toxicological Research (NCTR). The program was designed as a pilot program to serve as a model for anticipated future academic outreach programs for NCTR and FDA. During 1987 modifications to the

original agreement extended the program to allow participation by college and university students and faculty. The postgraduate, faculty, and student components of the program are summarized in this report. The program is administered by ORAU, a management and operating contractor for DOE.

38124 **(PB—88-185103/XAB) Absence of symptoms with carboxyhemoglobin levels of 16-23%.** Benignus, V.A.; Kafer, E.R.; Muller, K.E.; Case, M.W. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). 1987. 6p. (EPA—600/J-87/298). NTIS, PC A02/MF A01.

Pub. in Neurotoxicology and Teratology, Vol. 9, 345-348(1987).

It has been generally accepted that carboxyhemoglobin levels between 10-20% produce mild headaches, dizziness and/or nausea. Experimental double blind exposures of 18 healthy, nonsmoking young men at rest to 7,000 - 24,000 ppm, designed to elevate COHb to 15-20% in 3-5 minutes, were followed by exposure to 232 ppm CO designed to maintain COHb level for a total of 130 minutes. Resulting COHb values were 16-23%. These COHb values did not produce significantly more symptoms than reported in the control group (n=23). The symptoms which were previously reported in clinical studies of CO poisoning may have resulted from CO exposure in combination with (a) exposure to other substances, (b) stress due to the event that precipitated medical attention or (c) higher COHb levels before the first blood sample was taken.

38125 **(PB—88-185111/XAB) Respiratory responses of subjects with allergic rhinitis to ozone exposure and their relationship to nonspecific airway reactivity.** McDonnell, W.F.; Horstman, D.H.; Abdul-Salaam, S.; Raggio, L.J.; Green, J.A. (Environmental Protection Agency, Research Triangle Park, NC (USA). Health Effects Research Lab.). 1987. 14p. (EPA—600/J-87/297). NTIS, PC A03/MF A01.

Pub. in Toxicology and Industrial Health, Vol. 3, No. 4, 507-517(1987).

Ozone exposure in man produces changes in respiratory function and symptoms. There is a large degree of unexplained intersubject variability in the magnitude of these responses. There is concern that individuals with chronic respiratory diseases may also be more responsive to ozone than normal individuals. The purpose of this study was to describe the responses of subjects with allergic rhinitis to ozone exposure and to compare these responses to those previously observed in normal individuals. A further purpose was to measure the association between baseline nonspecific airway reactivity and changes in lung function and respiratory symptoms following ozone exposure.

38126 **(PB—88-185160/XAB) Ammonia effects on microinvertebrates and fish in outdoor experimental streams.** Hermanutz, R.O.; Hedtke, S.F.; Arthur, J.W.; Andrew, R.W.; Allen, K.N. (Environmental Protection Agency, Monticello, MN (USA). Environmental Research Lab.). 1987. 37p. (EPA—600/J-87/291). NTIS, PC A03/MF A01.

Pub. in Environmental Pollution 47, 249-283(Nov 1987).

Laboratory data on ammonia effects, the US EPA national-water-quality criteria for ammonia, and ammonia site-specific criteria were evaluated in four outdoor experimental streams (one control and three treatment streams) over a 76-week period. Calculated un-ionized ammonia concentrations varied daily and seasonally according to pH and temperature changes. Populations of four major microinvertebrate taxonomic groups (cladocerans, copepods, rotifers and protozoans) were monitored during a 4-week period early in the study, and six fish species (fathead minnows, bluegills, channel catfish, white suckers, walleyes, and rainbow trout) were tested for various time intervals, from 4 to 26 weeks, throughout the 76-week study period.

38127 **(PB—88-185178/XAB) Effects of daily ozone exposure duration and concentration fluctuation on yield of tobacco.** Heagle, A.S.; Heck, W.W.; Lesser, V.M.; Rawlings, J.O. (North Carolina State Univ., Raleigh (USA)). 1987. 9p. NTIS, PC A02/MF A01.

Pub. in American Phytopathological Society, Vol. 77, No. 6, 856-862(1987).

Flue-cured tobacco (Nicotiana tabacum McNair 944) was exposed to chronic doses of ozone (O_3) in open-top field chambers to determine the influence of frequency and magnitude of peak O_3 concentrations and daily exposure duration on tobacco yield response. The treatments were established by adding O_3 in amounts that were proportional to ambient O_3 concentrations or in constant amounts. The frequency of occurrence and level of peak O_3 concentrations were greater for each proportional-addition treatment than for the corresponding constant-addition treatments. However, the seasonal mean O_3 concentrations were nearly identical, and the yield response to O_3 was similar for both types of O_3 for 12 hr/day (1000 to 2200 hours EDT) was 10% less (three treatment levels combined) than in those receiving proportional addition for 7 hr/day (1000 to 1700 hours EDT). If other important crop species have a similar response to O_3 late in the afternoon, previous national crop loss estimates based on seasonal 7 hr/day O_3 exposures may be low.

38128 **(PB—88-186788/XAB) Accumulation and retention of No. 2 fuel-oil compounds in the blue crab, Callinectes sapidus' rathbun.** Melzian, B.D.; Lake, J. (Environmental Protection Agency, Narragansett, RI (USA)). 1987. 35p. (EPA—600/J-87/304). NTIS, PC A03/MF A01.

Pub. in Oil and Chemical Pollution 3, No. 5, 367-399(1986/87).

In order to determine if Blue Crabs (Callinectes sapidus) can bioaccumulate and retain complex mixtures of petroleum hydrocarbons, adult crabs were exposed for 14 days or 30-35 days in continuous flow-through seawater systems to three sublethal concentrations, nominally 0.00 (control), 0.01, or 1.0 ppm (mg/liter), of the water-accomodated fraction (WAF) of Number (No.) 2 fuel oil. Crabs exposed for 14 days were subsequently exposed to clean running seawater for a 30 day depuration period. Gill, hepatopancreas, and muscle tissue samples were collected from control, WAF exposed, and depurated crabs and analyzed by gas chromatography and/or gas chomatography-mass spectrometry. No. 2 fuel-oil compounds were not detected in any of the tissues of the control crabs. Trace amounts of fuel-oil compounds were detected in gill and hepatopancreas tissues collected from crabs exposed to the 0.01 ppm WAF and no fuel-oil compounds were detected in muscle tissues. All tissues of crabs exposed to the 1.0 ppm WAF accumulated No. 2 fuel-oil compounds and considerable amounts remained in hepatopancreas and gill tissues following depuration for 30 days in clean seawater.

38129 **(PB—88-193081/XAB) Lead hazards to fish, wildlife, and invertebrates: a synoptic review.** Eisler, R. (Patuxent Wildlife Research Center, Laurel, MD (USA)). Apr 1988. 146p. (BIOLOGICAL—85(1.14)). NTIS, PC A07/MF A01.

Ecological and toxicological aspects of lead (Pb) in the environment are briefly reviewed, with emphasis on fish and wildlife, their predators, and prey. Subtopics include sources and uses, chemical properties, mode of action, background concentrations, lethal and sublethal effects, and current recommendations for the protection of sensitive living resources. Resources that are at increased risk from Pb include migratory waterfowl that congregate at heavily hunted staging areas and ingest shot, avian predators that consume hunter-wounded game, domestic livestock near smelters and Pb battery recycling plants, zoo animals and livestock held in enclosures coated with Pb-based paints, wildlife that forage near heavily traveled roads, and aquatic life near mining activities.

38130 **(PB—88-863972/XAB) Shellfish: toxicology studies. October 1982-May 1988 (Citations from the NTIS data base). Report for October 1982-May 1988.** (National Technical Information Service, Springfield, VA (USA)). May 1988. 61p. NTIS PC N01/MF N01.

This bibliography contains citations concerning the effects of toxic substances on shellfish. Petroleum products, solvents, sewage, copper, mercury, chromium, dredged materials, and organic chemicals are among the toxic substances studied. Reproductive impairement, molting behavior, and population reduction caused by toxic chemicals are discussed. Shellfish as bioindicators and shellfish tolerance to toxic substances are briefly considered. Shellfish farming and economics are covered in a separate bibliography. (Contains 108 citations fully indexed and including a title list.)

38131 (PNL—6545) Dominant lethal study in CD-1 mice following inhalation exposure to 1,3-butadiene: Final technical report. Hackett, P.L.; Mast, T.J.; Brown, M.G.; Clark, M.L.; Evanoff, J.J.; Rowe, S.E.; McClanahan, B.J.; Buschbom, R.L.; Decker, J.R.; Rommereim, R.L.; Westerberg, R.B. (Pacific Northwest Lab., Richland, WA (USA)). Apr 1988. Contract AC06-76RL01830. 85p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010185/JAW.

The effects of whole-body inhalation exposures to 1,3-butadiene on the reproductive system was evaluated. The results of dominant lethality in CD-1 male mice that were exposed to 1,3-butadiene are described. Subsequent to exposure, males were mated with two unexposed females. Mating was continued for 8 weeks with replacement of two females each week. Gravid uteri were removed, and the total number, position and status of implantations were determined. The mice were weighed prior to exposure and at 0, 1, 2, 3, 4, 5, 6, 7, and 8 weeks after exposure and at sacrifice. The animals were observed for mortality, morbidity and signs of toxicity throughout the study. 19 refs., 5 figs., 9 tabs.

38132 (SNV—3166) Toxic effects of metals on fish. Evaluation of physiological test methods. Larsson, Aa.; Haux, C.; Sjoebeck, M.L. (National Swedish Environmental Protection Board, Solna). 1986. 68p. (In Swedish). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752945/JAW.

Physiological methods, previously used as health indicators in laboratory investigations on fish exposed to environmental pollutants, have been applied to feral fish living in metal-polluted coastal waters and lakes. This report summarizes the most important results and experiences of the field and laboratory investigations. The results show that clinical physiological methods may be very sensitive instruments for detecting and diagnosing sublethal disturbances in fish living in metal-polluted waters. However, the investigations also points to possible pitfalls and many problems of crucial importance for evaluation of the test results. Aberrant values for several physiological parameters in fish indicate that metal pollution has a profound influence on important physiological functions, such as immune defense, ion regulation and glucose homeostasis. Good agreement was found between effects noted in fish exposed to metals under natural field conditions and those found in laboratory tests. In the report is also given a proposal for test strategy and selection of suitable physiological test parameters for future health investigations on fish in metal-polluted coastal waters and lakes. (authors).

38133 (UBA-FB—85-076) Uptake of cadmium in plants on various soils. Final report. Kuntze, H.; Foerster, C. (Umweltbundesamt, Berlin (Germany, F.R.); Niedersaechsisches Landesamt fuer Bodenforschung, Hannover (Germany, F.R.)). Sep 1986. 70p. (In German). Umweltbundesamt, Berlin (Germany, F.R.).

Umweltbundesamt - Texte.; No. 29/86.

In a pot-trial the influence of pH-value, N- and K-fertilization, soil-moisture, content of humus and iron of different soils was investigated. Different extractants should be tested, whether they represent the available Cd-content of the soils. Decreasing pH-value of the soils effected very much increased Cd-uptake of the plants. Liming decreased the Cd-availability. In some cases the Cd-concentration of the plants increased after high liming. Increasing K-fertilization decreased the Cd-content of some vegetables. After increasing N-fertilization the plant Cd-concentration increased, but parly caused by reduced plant-growth. On a humic sandy soil rich in Fe the Cd-concentration of the plants was much lower than that of the plants from humic sandy soils poor in Fe. Increasing addition of Fe with high solubility to a Cd-contenting soil caused yield depression, phosphate deficiency and increased Cd-content of the plants. Increasing addition of Fe with low solubility causes partly increasing yield and decreased Cd-contents. Among the 4 tested extractant 0,1 M $CaCl_2$ represented best the available Cd-content of the test soils. With 26 refs., 13 tabs., 13 figs..

38134 (UBA-FB—86-034) Phytotoxic effects of air pollutants, early identification, and its application to bioindication. Bornkamm, R.; Seeliger, T.; Schreyer, B.; Langner, S.; Koch, P.; Bussler, W.; Fischer, E.; Stan, H.J.; Wichmann, A. (Umweltbundesamt, Berlin (Germany, F.R.); Technische Univ. Berlin (Germany, F.R.)). Mar 1986. 193p. (In German). Umweltbundesamt, Berlin (Germany, F.R.).

Several crops and wildflowers were treated with natural air, filtered air and with different (realistic) ozone concentrations as well. The following parameters were investigated mainly: formation of stress ethylene; changes of cell and tissue structures detectable in light or electron microscope; diffusion resistance of leaves; growth and formation of necroses. The results show species specific differences in the sensitivity against ozone; the results were discussed under the following viewpoints: dose-effect-relation, early identification, standardization, representativeness, and diagnosis of symptoms. With 113 refs., 55 tabs., 72 figs.

38135 (UCRL—21001-88-1) Comparison of the response of mature branches and seedlings of Pinus ponderosa to atmospheric pollution: Progress report. Houpis, J.L.J.; Surano, K.A.; Cowles, S. (Lawrence Livermore National Lab., CA (USA)). Jan 1988. Contract W-7405-ENG-48. 13p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011315/JAW.

This report is divided into four sections. These sections are: (1) Project Overview; (2) Physiology-Morphology-Autonomy Studies; (3) Instrumentation; and (4) Data Management and Analysis. The Project Overview section contains general information relating to the management of the project. In the Physiology-Morphology-Autonomy Studies section, information and results pertaining to studies conducted in these areas are reported. The Instrumentation section includes informatiopn on topics pertaining to the branch exposure system and on instruments involved in fumigation and monitoring. The Data Management and Analysis section contains information relating to experimental design and data management.

38136 Ranking the potential carcinogenic hazards to workers from exposures to chemicals that are tumorigenic in rodents. Gold, L.S.; Backman, G.M.; Hooper, N.K.; Peto, R. (Lawrence Berkeley Lab., CA (USA)). *Environmental Health Perspectives;* **76**: 211-219(Dec 1987). Contract AC03-76SF00098.

For 41 chemicals there exist both reasonable data on carcinogenic potency in experimental animals and also a defined Permissible Exposure Level (PEL), which is the upper limit of legally permissible chronic occupational exposure for US workers. These 41 agents are ranked by an index that compares the permitted chronic human exposure to the chronic dose rate that induces tumors in 50% of laboratory animals. This index, the Permitted Exposure/Rodent Potency index, or PERP, does not estimate absolute risks directly, but rather suggests the relative hazards that such substances may pose. The PERP values for these 41 substances differ by more than 100,000-fold from each other. The PERP does not take into account the actual level of exposure or the number of exposed workers. Nevertheless, it might be reasonable to give priority attention to the reduction of allowable worker exposures to substances that appear most hazardous by this index and that some workers may be exposed to full-time near the PEL. Ranked by PERP, these chemicals are: ethylene dibromide, ethylene dichloride, 1,3-butadiene, tetrachloroethylene, propylene oxide, chloroform, formaldehyde, methylene chloride, dioxane, and benzene.

38137 The food chain as a source of toxic chemical exposure. Travis, C.C.; Arms, A.D. (Office of Risk Analysis, Health and Safety Research Div., Oak Ridge National Lab. (US)). pp 95-113 of Toxic chemicals, health and the environment. Lave, L.B.; Upton, A.C. Baltimore, MD; John Hopkins University Press (1987).

The authors are concerned with the properties of chemicals that lead to their uptake by plants and animals and to their eventual incorporation into the food supply. Some chemicals, such as DDT, become concentrated in the food chain. DDT also accumulates in the body, as does lead and other chemicals. Still other chemicals are biologically inactive and remain in the environment. The au-

thors focus on pesticides and develop a formula to predict how readily particular pesticides find their way into food.

38138 **Concentration and temporal response of tracheal organ cultures to single and repeated benzo(a)pyrene exposures.** Placke, M.; Chang, M.J.; Fisher, G.L. (Battelle Columbus Labs., 505 King Avenue, Columbus, OH 43201 (US)). pp 755-770 of Polynuclear aromatic hydrocarbons: Chemistry, characterization and carcinogenesis. Cooke, M.; Dennis, A.J. Columbus, OH: Battelle Press (1986). (CONF-8410225—).

From 9. international symposium on polynuclear aromatic hydrocarbons; Columbus, OH, USA (30 Oct 1984).

Comparative species studies of the metabolism, incidence, latency and type of tumor to evolve following polynuclear aromatic hydrocarbon (PAH) administration have indicated that the hamster responds in a fashion similar to the clinical and pathologic features with longterm carcinogen exposure in humans. This study assessed the occurrence and histopathologic appearance of preneoplastic alterations in the mucosa of hamster tracheal organ cultures and compared them to those reported for rat and human tissues. Explants were singly or repeatedly exposed to a range of concentrations of benzo(a)pyrene (BaP). A spectrum of changes (focal hyperplasia, multifocal anaplastic proliferations and diffuse cytotoxic damage) developed. Lesion severity was correlated with increasing concentrations. It was concluded that hamster tracheal organ cultures are more sensitive to the carcinogenic effects of BaP than the reported response from rat explants.

38139 **Recommendations for screening for potential human germ cell mutagens: An ICPEMC working paper.** Bridges, B.A.; Mendelsohn, M.L. (MRC Cell Mutation Unit, Univ. of Sussex, Falmer, Brighton, Sussex BN1 9RR (GB)). pp 51-66 of Genetic toxicology of environmental chemicals. Part B: Genetic effects and applied mutagenesis. Ramel, C.; Lambert, B.; Magnusson, J. New York, NY; Alan R. Liss Inc. (1986). (CONF-8506137—).

From 4. international conference on environmental mutagens; Stockholm, Sweden (24 Jun 1985).

If resources and feasibility permit, the rodent dominant lethal test has a clear superiority as a screening test for the detection of agents capable of causing chromosomal aberrations in male germ cells, both on rational grounds, and on the basis of its performance in the limited statistical analysis that has been possible. It possesses an additional advantage that it may also pick up some of the effects of aberrant segregation of chromosomes (aneuploidy) and some gene mutations. There is little to choose between the other three tests in terms of performance; all appear to give results at variance with the consensus assignment about 20-25 per cent of the time and therefore cannot be considered to be surrogates for a mammalian germ cell assay. A corrected accuracy of 75 to 80 per cent is considerably better than not testing at all. The tests will pick up most of the known germ cell mutagens; moreover the false results generally point the finger at substances of known or suspected carcinogenicity so that the results are not without value in overall safety evaluation. Because it is an in vivo test, does not require experienced cytogenetic skills, and is relatively cheap, the micronucleus test may prove to be marginally the more attractive of the three.

38140 **(AD-A—190118/0/XAB) Microwave dispersion and absorption in tissues: molecular mechanisms. Final report, 1 January 1978-28 February 1986.** Foster, K.R. (Pennsylvania Univ., Philadelphia (USA). Dept. of Bioengineering). 10 Dec 1987. 13p. NTIS, PC A03/MF A01.

The authors measured the dielectric properties of materials (tissues, aqueous protein solutions, microemulsions, macroscopic suspensions) from 0.1-18 GHz. These properties are determined over this frequency range by the dielectric properties of water and by ionic effects. Analysis of the data shows that the dielectric properties of the suspending water differ from those of the pure liquid, presumably due to interfacial effects. Similar effects are seen in diverse transport properties and even in nonaqueous systems. The results suggest that water within a couple of monolayers from surfaces have motional correlation times that are tenfold or so longer than those of the bulk liquid. The authors suggest that this motional restriction is a physical effect due to the presence of relatively immobile surfaces, rather than from chemically specific binding. This study has led to an improved understanding of the mechanisms of absorption of microwave energy in tissues, and shown the usefulness of comparative studies of transport processes in complex suspensions.

38141 **(AD-A—190377/2/XAB) Expedient methods for rattle-proofing certain housing components. Final report.** Schomer, P.D.; Hottman, S.D.; Kessler, F.M.; Kessler, R.K. (Army Construction Engineering Research Lab., Champaign, IL (USA)). Dec 1987. 54p. (CERL-TR-N—87/24). NTIS, PC A04/MF A01.

Occupants of buildings located in areas of high-level impulse noise usually report that the main annoyance factor is the rattle produced by house components upon vibration. This type of noise is associated with helicopter flybys and blast overpressure from artillery and other military training operations. Methods are needed for mitigating rattles in both existing structures and future construction. This report analyzes several different elements to identify individual components contributing to rattle. Elements studied include windows, doors, wall-mounted objects, bric-a-brac, ductwork, gutters, and light fixtures, among others. In general, the primary source of rattle is any small gap between two hard surfaces that are subject to vibration from an exterior noise source. Upon excitation, these surfaces can impact each other, producing the sound. Other rattle sources are identified, and methods are recommended for eliminating or reducing noise from the individual elements.

38142 **(IVO-A—04/87) Physiological effects of extremely low frequency electric and magnetic fields.** Valjus, J. (Imatran Voima Oy, Helsinki (Finland)). 1987. 159p. (In Finnish). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752814/JAW.

According to literature, ELF electric and magnetic fields can affect several physiological systems. However, there are no undisputable evidence of adverse effects on one's health even in fields far exceeding the electric field strengths and magnetic flux densities existing in practice. From epidemiological studies there is some evidence available on the connection of magnetic field exposure and cancer. This connection is, however, so weak that it is very difficult to point it out among the many other environmental factors. In laboratory tests magnetic field has been found to affect the development of chick embryos. In mammals such effects are far more uncertain. In general, magnetic field is considered a greater risk factor than electric field. Strong electric fields may, nevertheless, cause symptoms to patients with cardiac pacemakers, and e.g. spark discharges which may cause chromosome exchanges with, at least in principle, adverse health effects. The adverse health effects of electric and magnetic fields can only be detected in large test groups. Still, the hazards to the environmental and the labour welfare by these fields are worth of studying as a part of the purity and safety image of electrical energy. Such research would also give a good basis for public information, attitudes for government policy and also for practical measures, if required.

38143 **(LBL—20812) Assessment of biological effects associated with magnetic fields from a superconducting magnetic energy storage plant: Final report.** Tenforde, T.S. (Lawrence Berkeley Lab., CA (USA)). Apr 1986. Contract AC03-76SF00098. 89p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88008412/JAW.

This report provides a detailed evaluation of the potential biological effects of fringe magnetic fields associated with a superconducting magnetic energy storage (SMES) plant. The aspects of magnetic fields that are discussed include mechanisms of interaction of static and slowly time-varying magnetic fields with living systems; biological effects of magnetic fields on human and subhuman species, including the results of both laboratory studies and human epidemiological surveys; physical hazards posed by the interactions of magnetic fields with metallic implants, e.g., aneurysm clips and prostheses, and with medical electronic devices such as cardiac

pacemakers; extant guidelines for occupational exposure to magnetic fields are summarized; recommendations for defining acceptable levels of exposure to SMES magnetic fields by occupational personnel and the population-at-large; and recommendations concerning several areas of research that would further our understanding of magnetic field interactions with living systems, and would provide additional elements of information required for the development of future exposure standards. 328 refs., 12 figs., 5 tabs.

38144 **(ORNL/TM—10769) Examination of specifications and standards relating to the susceptibility of medical electronic devices to transient electrical overstress: Task 2.** Googe, J.M.; Hess, R.A.; Ewing, P.D.; Agouridis, D.C. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 75p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010743/JAW.

This study was undertaken to address the US Army's concern for the safe operation of the Harry Diamond Laboratories (HDL) electromagnetic pulse (EMP) simulation facilities, which in turn led to concern for the safety of medical electronics equipment in general and medical electronic device wearers in particular. The main concerns of this study are the standards and regulations that address the susceptibility of these types of electronic devices to transient electrical overstress. The study revealed no standards, regulations, or industry-wide guidelines that deal with the susceptibility of medical electronics to EMI from radiative sources. The standards sought in this task do not exist, nor have any reached the stage of development to be accessible in the literature. Furthermore, the agencies that usually publish such standards have none ready for release at this time. In the course of this study it was found that the process of forming a community of interested professionals is under way but has not advanced to the point where it can provide acceptable industry standards and regulations. 28 refs.

38145 **(ORNL/TM—10784) Bioelectromagnetic effects of EMP: preliminary findings.** Aldrich, T.E.; Easterly, C.E.; Gailey, P.C.; Hamilton, C.B. (Oak Ridge National Lab., TN (USA); Tennessee Univ., Knoxville (USA). Dept. of Health, Leisure and Safety; EC Corp., Knoxville, TN (USA)). Jun 1988. Contract AC05-84OR21400. 120p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE88012118/JAW.

Facilities to simulate electromagnetic pulses (EMPs) are used to test military equipment and electrical communications devices for resistance to the effects of an EMP caused by an upper-atmospheric nuclear detonation. The rapid rise time and high field strengths (0.1-50 kV/m) of an EMP distinguish it from other electromagnetic phenomena. Certain types of EMP simulators also expose facility operators and members of the public to electromagnetic fields of varying intensity as do other natural sources such as the fields produced near a lightning bolt. Limited biological effects data have been collected to assess the potential EMP health hazards to humans. Evidence from the available database does not establish that EMPs represent either an occupational or a public health hazard. A critique is presented of the EMP research published to date in order to explore its limitations and similarities with related outcome experience from other electromagnetic field research. Laboratory research and multiple years of observations on workers in existing EMP manufacturing and simulation facilities suggest that there are no acute or short-term health effects. The occupational exposure guideline for EMP is 100 kV/m, which is far in excess of usual exposures with EMP simulators. There are many persistent questions surrounding biological effects of electromagnetic fields. Based on these concerns, research needs are identified for determining to what extent biological systems exposed to EMPs reflect phenomena currently being observed with other electromagnetic exposure regimens. Additional options relate to continuing medical surveillance of occupationally exposed personnel and studies of communities proximal to EMP simulators.

38146 **Reduction of the nocturnal rise in pineal melatonin levels in rats exposed to 60-Hz electric fields in utero and for 23 days after birth.** Reiter, R.J.; Anderson, L.E.; Buschbom, R.L.; Wilson, B.W. (Univ. of Texas Health Science Center, San Antonio (USA)). *Life Sciences;* **42**: No. 22, 2203-2206(1988). Contract AC06-76RL01830.

Rats exposed to 60-Hz electric fields of either 10, 65, or 130 kV/m from conception to 23 days of age exhibited reduced peak nighttime pineal melatonin contents compared to unexposed controls. As a group, the exposed rats also exhibited a phase delay, estimated at approximately 1.4 hours, in the occurrence of the nocturnal melatonin peak. No clear dose-response relationship was noticed over the range of electric field strengths used as treatments in these experiments. These are the first studies concerned with the effects of electric field exposure on the pineal melatonin rhythm in immature rats. The findings are generally consistent with those obtained using adult rats, where electric field exposure has been shown to abolish the nighttime rhythm in pineal melatonin concentrations.

38147 **Effects of electric lighting on human muscle strength: Visible spectrum and low frequency electromagnetic radiation.** Jewett, D.L.; Berman, S.M.; Greenberg, M.R. (Dept. of Orthopaedic Surgery, Univ. of California, San Francisco, CA 94143 (US)). pp 390-391 of The medical and biological effects of light. Wurtman, R.J.; Baum, M.J.; Potts, J.T. New York, NY; The New York Academy of Sciences (1985). (CONF-8410211—).

From New York Academy of Science conference on medical and biological effects of light; New York, NY, USA (31 Oct 1984).

Ten subjects who stated that they were bothered by fluorescent lighting were studied using maximal strength of shoulder forward flexion. Fifty trials, each a randomized sequence of paired exposures to 400 foot-candle incandescent and cool-white fluorescent light, were measured in each subject in order to counterbalance effects of fatigue. Over all subjects, the mean difference in maximal muscle strength for the two lighting conditions was less than 0.2% of the usual strength measured. The results of Study I are not in agreement with the popular writings of John Ott, who used "kinesiology testing" to support his claims that muscle weakness was caused by both cool-white fluorescent light and lack of electric field shielding. Mr. Ott agreed to test the effect of shielding, double-blind, using his kinesiological evaluation of the subjects' strength. The authors conclude that blinding the kinesiology testing significantly alters the results, which in the unblinded case is susceptible to suggestion, and any claims based upon use of this methodology, unblinded, are suspect.

57 HEALTH AND SAFETY

38148 **(NP—8770210) Higher safety on the job as a result of object formation and behaviour control. Psychological aspects of industrial safety in everyday situations.** Schroeder, O.E. (Verein Deutscher Ingenieure (VDI), Duesseldorf (Germany, F.R.). Fachgruppe Textil und Bekleidung). 1986. 44p. (In German). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88770210/JAW.

The study outlines the development of the systems 'man/environment' and 'man/technology' and the human patterns of action. The findings on human patterns of action are then applied to the working environment, especially to objects and behaviour. Standards and habits are named as basic elements of safety at work. Particular interest is taken in the criteria required for the formation of patterns of behaviour, learning processes for acquiring 'safe' habits, and the application of the latter in the field of industrial health. The role of groups as carriers and formers of habits is stressed, and improvisation at work is briefly mentioned. (HSCH).

38149 **(UCRL—97975) Temperature profiles in forced-ventilation enclosure fires.** Backovsky, J.; Foote, K.L.; Alvares, N.J. (Lawrence Livermore National Lab., CA (USA)). Feb 1988. Contract W-7405-ENG-48. 11p. (CONF-880634—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006807/JAW.

From 2. international symposium on fire safety science; Tokyo, Japan (13 Jun 1988).

We investigated the effect of ventilation rate, ventilation configuration, fire elevation, and the presence of a plenum (suspended ceiling) on the fire compartment temperatures during forced ventilated methane gas fires (100-400 kW). We found that with low air-inlet positions, fires with ventilation rates greater than

2 to 3 times the stoichiometrically required air (referred to here as well-ventilated fires) produce two-layer temperature profiles; fires with a lower ventilation rate (under-ventilated fires) produce single-layer profiles with a temperature gradient. Higher temperatures throughout the enclosure are seen in underventilated fires as compared to well-ventilated fires. We observed that high air-inlet locations perturb the two-layer temperature profile of the well-ventilated fire, cooling the upper layer and heating the lower layer. For underventilated fires, high air-inlet locations lower temperatures in the enclosure but do not perturb the profile shape. Elevated fires and fires in a compartment with a plenum were seen to behave similarly for the same distance from fire base to ceiling, producing hotter layers the shorter the distance. 9 refs., 13 figs.

38150 **Methodology for the selection of environmental dispersion models in health-risk assessments.** Seiler, F.A. (Inhalation Toxicology Research Institute, Albuquerque, NM (USA)). *Environment International;* 13: No. 4-5, 351-357(1987). Contract AC04-76EV01013.

Criteria for the selection of environmental dispersion models in health risk assessments are analyzed. The state of knowledge on the health effect exerts a dominant influence on this evaluation, which focuses on averaging procedures, the resolution in space and time, and error propagation. Uncertainties in the cause-effect relationship are the final contributions to the error of the result. Intermediate calculations should neither increase this error unduly nor be carried out with an accuracy significantly better than that which can be achieved in estimating the health effects. In this context, a methodology for performing credible calculations with an effort commensurate with the state of knowledge is discussed. 21 references, 1 figures, 1 table.

38151 **(CONF-880582—2) Scaling of hydrologic properties for simulation of watershed drainage.** Wilson, G.V.; Luxmoore, R.J.; Jardine, P.M.; Jones, J.R. (Tennessee Univ., Knoxville (USA); Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 23p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010458/JAW.

From Validation of flow and transport models for the unsaturated zone meeting; Ruidoso, NM, USA (23 May 1988).

Facilities suitable for field testing of transport models involving continuous monitoring of hillslope drainage have been developed in a 0.45-ha forested subwatershed in eastern Tennessee. The soil properties, K(θ) and θ({psi}), estimated in situ for each horizon of one reference pedon have been determined. The hydraulic properties of the site have been intensively characterized and scaling factors determined from surface infiltration and subsurface permeameter measurements. The results of semivariogram analyses indicate that surface and subsurface properties are random processes. The dynamics of subsurface flow in this forested watershed during storm events are being monitored, and results from a selected high intensity rainfall event of 51.4 mm are outlined. 16 refs., 6 figs., 2 tabs.

38152 **(CRIE-U—86047) Investigation on water quality and isotopic composition of ground water in bedrock. Study on ground water dating (3).** Motojima, Isao. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). Jun 1987. 24p. (In Japanese). NTIS (US Sales Only), PC A03. Order Number DE88752548/JAW.

The age and maturation of ground water in a bedrock were studied by the water quality and isotopic composition. The object was the ground water discharged in the work tunnel for ground cavern (about 450m depth) located in North Kanto area. The chemical composition of ground water was predominantly composed of the dissolved rock composition and newer and more fluid ground water was intermixed easily around the investigated site. ^{222}Rn concentration was different in each location of discharged water owing to the difference of intermixed water quantity of comparatively newer ground water and the difference of saturation degree in the permeated ground water. Tritium concentration were different in all discharged locations but the degree was lower compared with ^{222}Rn. The origin of underground water at the investigated time (1985) was concluded to be rainfall in 1967 and the rate of more aged ground water was 10 to 20% by the study of half life of tritium and law of mass conservation, indicating that the rate of comparatively newer ground water was much more. (7 figs, 5 tabs, 5 refs)

38153 **(INIS-BR—1094) Geological interpretation of aeromagnetics and aeroradiometrics data of Carajas area - sheet SB-22-Z-A-III.** Marinho, F.A.V.; Azevedo, M.L.V. de. (Companhia de Pesquisas de Recursos Minerais, Rio de Janeiro (Brazil)). 1986. 13p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702791/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

The upward continued map of sheet SB.22-Z-A-III in the Carajas Mineral Province shows the magnetic anomalies associated to the Leste Ridge, Carajas fault and Rabo Ridge to be more complex than apparent from the total magnetic field map. It also shows that the Carajas granite truncates metasediments of the Salobo Sequence northeast of the Carajas fault. First vertical derivative processing with reduction to the pole has been effective in the definition of the magnetic structures associated with the upper crustal sequences of the basement complex of the Carajas area and has made it possible the definition of the magnetic lineations associated with the tectonic structure of the area. The apparent magnetic susceptibility map has further reinforced the interpretted zones and the structures that were defined from the first vertical derivative map. The radiometric data were important in the definition of the granite borders and in the separation of the Salobo and Grao-Para units. This work suggest improvements to the geologic knowledge of this part of the Carajas area. Based on this geophysical interpretation and correlation with known mineralizations, priority areas have been identified as having high potential for economic mineralization. Recommendations are made for more detailed geophysical follow-up studies in these areas.

38154 **(INIS-BR—1106) Geocronology study of the power sequence of the Sao Roque group.** Schmus, W.R. van; Tassinari, C.C.G.; Cordani, U.G. (Kansas Univ., Lawrence (USA). Dept. of Geology). 1986. 8p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702801/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

U-Pb results on zircons, as well as Rb-Sr whole rock analyses, were carried out on metarhyodacites of the Sao Roque Group, located on the Morro do Povilho, near Santana do Parnaiba (SP). These rocks are interbedded with E-W trending metapelites which underlie meta-arkoses and metaconglomerates of the lower sequence of the Sao Roque Group. In a Concordia plot, the U-Pb zircon analytical points were aligned in a chord with an upper intercept of 1790 +- 14 Ma., which shall be interpreted as the zircon crystallization age. The lower intercept, of about 500 Ma., is referred to an important lead loss episode in late Proterozoic times, which is confirmed by the Rb-Sr whole rock analyses. The age values on the Sao Roque Group can be correlated with similar values obtained on acid volcanics of the Espinhaco Supergroup in Minas Gerais and Bahia, and they strongly suggest that the lower metassedimentary units of the group could be much older than the upper sequences.

38155 **(INIS-mf—11199) Radiometric dating by alpha spectrometry on uranium series nuclides.** Wijk, A. van der. (Rijksuniversiteit Groningen (Netherlands)). 6 Nov 1987. 167p. NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702376/JAW.

Contains summary in Dutch and previously published material.

This thesis describes the analytical and technical procedures that are required for routine application of both the ^{230}Th^{234}U dis-

equilibrium dating method for peat and the ^{210}Pb dating method for lake sediments. Its principal aim is to test, refine and discuss the reliability and validity of these methods. On the other hand, the analytical procedures that were introduced open a wide range of other interesting fields of research that are not necessarily restricted to geological problems only. Chapter 5 reports an obviously not foreseen application: detection of alpha emitting nuclides released in the first weeks of May, 1986 during the accident with the nuclear power plant in Chernobyl, USSR. 128 refs.; 43 figs.; 15 tabs.

38156 **(LBL—24453) A scheme for calculating flow in fractures using numerical grid generation in three-dimensional domains of complex shapes.** Muralidhar, K.; Long, J.C.S. (Lawrence Berkeley Lab., CA (USA)). Sep 1987. Contract AC03-76SF00098. 143p. NTIS, PC A07/MF A01; GPO Dep. Order Number DE88008426/JAW.

A numerical scheme for the solution of fluid flow equations in a complex three-dimensional geometry has been developed in order to study fluid flow in rock fractures. The scheme consists of two parts, the first being a grid generator and the second, a flow solver in a generalized coordinate system. The grid is determined by mapping the irregular flow region of the fracture, onto that bounded by a rectangular parallelepiped. The mapping function is implicitly defined via differential equations, which in turn are derived from a variational principle. This procedure is general enough to incorporate various aspects of grid control such as orthogonality, mesh concentration, treatment of singular points etc. However, only orthogonality has been included in this report. The others are not expected to be significant in the problem of fluid flow in a single fracture. Complete details of the derivation of the governing equations and boundary conditions have been given here. The flow is taken to satisfy the Navier-Strokes equations. These are also solved numerically, by simultaneously solving for the pressure field from a Poisson equation. The complete procedure is validated by computing various test cases, which have been included in this report.

38157 (NAGRA-NTB—87-15, pp 335-343) **Formation of migmatites in metapelite rocks from boreholes of Northern Switzerland: preliminary results.** Mazurek, M. (Basel Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

High-grade metapelites from two boreholes in northwest Switzerland comprise a wide spectrum of minerals and textures. Three metamorphic stages may be distinguished: 1) amphibolite facies metamorphism and deformation, 2) generation of migmatites, 3) retrogressive overprint. The metamorphic P-T path in terms of quantitative phase diagrams is compared with microtextural evidence. The different leucosome patterns and geometries yield constraints on the processes leading to migmatization. Anatexis and metamorphic differentiation appear to be the most likely mechanisms. Evidence for the existence of metamorphic segregations in a certain rock type of the borehole of Leuggern is shown. As a conclusion, it is suggested that both anatexis and metamorphic segregation contributed to migmatization. (author) 20 refs., 5 figs., 1 tab.

38158 (NAGRA-NTB—87-15, pp 345-367) **Facies analysis and depositional environments of the Permocarbon in the trough of Northern Switzerland.** Matter, A. (Bern Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

A narrow, 10-12 km wide, late Variscan trough with a clastic fill of Stephanian to Upper Rotliegend age has recently been discovered in northern Switzerland through the geophysical investigations and deep boreholes drilled by Nagra. Sedimentological facies analysis of the continuously cored sequences from the wells Kaisten, Riniken and Weiach enables the depositional environments and the sedimentary evolution of this trough to be reconstructed. A 572 m thick Upper Carboniferous sequence was recorded from Weiach and comprises six cyclical units. Of these, three units are characterized by large scale fining upward cycles ('Grosszyklische Series'), the middle one of which is coal-bearing. Each of these megacyclical units is interbedded and alternates with small scale fining upward cycles ('Kleinzyklische Series'). The megacycles reach up to 38 m in thickness. These consist of a sandstone member, comprising stacked first-order fining upward cycles, and an argillaceous member, comprising laminated siltstone rhythmites and varvelike, bituminous dark grey mudstones. The 'Kleinzyklische Series' are characterized by the presence of cm- to dm-bedded sheet-like sandstones interbedded with siltstones, mudstones thin coals and tuffaceous ash beds. They are readily distinguished from the 'Megazyklische Series' by a sandstone/shale ratio of <2. Erosional sharp basal contacts, lag deposits, dune and ripple cross-bedding and a fining upward grain size profile identify these megacycles as fluvial deposits. The considerable thickness of their sandstone members indicates rapid vertical aggradation and channel stability. This as well as the type of sedimentary structures and the fact that the sandy channel deposits are enclosed in argillaceous sequences ('Kleinzyklische Series') suggest an anastomosing river system. 31 refs., 9 figs.

38159 (NAGRA-NTB—87-15, pp 369-381) **Diagenesis of Permian alluvial fan deposits of Northern Switzerland.** Bluem, W. (Bern Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Fine-grained sandstones of Permian alluvial fan deposits from three Nagra boreholes (Weiach, Riniken, Kaisten) and an exploration well, drilled at Wintersingen are clast supported, moderately sorted arkosic greywackes containing typically 2-20 % clayey matrix. Petrographic studies indicate that the origin of this clayey matrix is postdepositional. Mechanical infiltration of fines and diagenetic reddening of detrital and authigenic iron oxides are the earliest recorded events. Additionally, nodular calcites of calcrete origin and fibrous illitic clays are also ascribed to the eogenetic environment. The present strong compaction fabric results from general lack of eogenetic framework supporting cements. During mesogenesis, secondary porosity was generated through partial removal of early calcite. At the same time, a first generation of syntaxial quartz cementation and a subsequent fibrous illite authigenesis took place. Leaching of detrital K-feldspars post-dating compaction is recorded throughout the studied boreholes. The following burial diagenetic events differ between the various boreholes: in Weiach and Wintersingen kaolinite, illite, prismatic quartz and ankerite/siderite are recorded; in Riniken K-feldspar, illite, prismatic quartz and dolomite developed; whilst in Kaisten K-feldspar and microcrystalline quartz-cement dominate. These differences reflect the chemistry, pH and ionic strength of the pore fluids. Filling of veins by dolomite/ankerite, iron-rich and subsequent iron-poor calcite is the latest recorded event. (author) 21 refs., 10 figs., 1 tab.

38160 (NAGRA-NTB—87-15, pp 397-413) **Diagenesis of Triassic evaporites in Northern Switzerland.** Dronkert, H. (Bern Univ. (Switzerland)). 1987. Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Examination of Triassic cores from the Nagra boreholes Schafisheim, Riniken, Leuggern, Boettstein and Weiach and the NOK well Beznau, reveal a complex sequence of evaporitic authigenic minerals, including dolomite, gypsum, anhydrite, halite, chert and talc, which are interpreted to represent an eogenetic assemblage. Subsequently, during mesogenetic (burial) diagenesis gypsum dehydrated to anhydrite. Later replacement of anhydrite by megaquartz and dolomite is recorded in sulphate-bearing carbonate beds. Concentrations of sphalerite, fluorite and megaquartz are also present throughout the studied sequence. Ultimately, following post-Tertiary uplift, meteoric water ingress into the shallow wells Beznau, Boettstein and Leuggern resulted in telogenetic hydration of the anhydrite, causing fracturing of the host rock and extensive dissolution of the sulphates. Although most original sedimentary structures are still preserved, practically all the primary authigenic minerals have undergone subsequent diagenetic modification since eogenesis. (author) 57 refs., 27 figs.

38161 (NAGRA-NTB—87-15, pp 415-430) **Lithostratigraphy and correlation of the Dogger sediments in the boreholes of Weiach, Riniken and Schafisheim.** Blaesi, H.R. (Bern Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Middle Jurassic sediments (the 'Dogger Group' of Switzerland) in three Nagra boreholes (Weiach, Riniken and Schafisheim) are correlated on the basis of facies relationships with the equivalent sediments at outcrop in the Jura mountains of canton Aargau (Switzerland) and southern Germany. In Weiach, the Dogger Group is dominated by mudrocks and forms a typical basinal sequence known locally as the 'Schwaebische facies'. By contrast, in Schafisheim the sequence is very similar to the outcrop in the Aargau Jura mountains and is represented by carbonate sediments forming a typical platform facies. The Dogger Group sediments at Riniken lie in an intermediate position and comprise an interfingering of platform and basinal facies. In all three boreholes a series of shallowing-upward regressive cycles can be recognized in the Dogger Group sediments. These cycles are correlated with worldwide sea level changes. The culmination of the shallowing-upward sequences is usually marked by the occurrence of iron-rich oolites formed during periods of low sedimentation rate either at the end of a regressive phase or during rapid sea level rise at the beginning of the subsequent transgression. The Callovian/Oxfordian boundary (athleta- to transversarium zone) was examined with foraminifera, ostracodes and dinoflagellates in sections from the Swabian Alb and the Swiss Jura mountains controlled as accurately as possible by ammonites. In this study, no useful stratigraphical markers were found among the foraminifera. The successive occurrence of three forms from the Nophrecythere cruciata-group (ostracodes) is of particular significance. The samples contain a rich dinoflagellate flora (47 genera, 80 species), but a direct application of published dinoflagellate zonations is not possible. (author) 18 refs., 16 figs.

38164 (NAGRA-NTB—87-15, pp 543-552) **Fossil maturity, Paleothermogradients and strata gap in the borehole of Weiach in the light of model calculations of thermal maturity.** Kempter, E.H.K. (Rico Research, Petroleum Geologists, Niederrohrdorf (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Thermal maturities, observed on core samples from Nagra's borehole Weiach, are abnormally high. The vitrinite reflectances measured have nothing to do with present temperature conditions. They reflect fossil maturity acquired probably already during the Permian. A preliminary study on behalf of Nagra, involving computer modelling of the thermal history of Weiach, suggests an average thermogradient of about 104 degrees C/km, effective until the end of the Early Permian. This value is more than twice as high as the present one. The most probable thermal model, which leads to calculated equivalents of vitrinite reflectance in close agreement with observed values, requires a stratigraphic gap of about 1000 m somewhere between the base of the Buntsandstein and the top of the Lacustrine Interval (Lower Autunien). The gap would also represent a significant thermal unconformity, separating rocks subjected to strongly contrasting thermal regimes. The algal organic material, identified in samples from the Early Autunian lacustrine deposits, exhibits a range of maturity values normally regarded as typical for the oil generating zone. Likewise, vitrinite reflectances measured on samples of the Stephanian coal, are typical for the zone of gas/condensate generation. However, hydrocarbon shows reported while drilling were insignificant. The paradox may be explained by hydrocarbon generation having taken place a long time ago, allowing some 250 million years to the hydrocarbons to escape particularly during repeated episodes of faulting, uplift and erosion. Most may have been lost at the end of the Paleozoic already. (author) 9 refs., 2 figs.

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Since 1981, Nagra has conducted extensive regional studies into the hydrophysical and hydrochemical properties of deep groundwaters from northern Switzerland and adjacent areas. The understanding of the groundwaters in the Triassic and Permian aquifers as well as in the crystalline basement has been considerably enhanced by the deep drilling program of Nagra. This paper presents selected results of the investigations and discusses them with respect to deep groundwater flow systems in northern Switzerland. The composition of dissolved gases present in the groundwaters is very characteristic for each of the different aquifers. Oxygen is almost invariably absent and nitrogen is often the dominant gas. High nitrogen-argon-ratios, as typical of the Permian and Lower Triassic aquifers indicate that a part of the nitrogen is released from organic compounds. In the vicinity of the Rhine graben, ascending carbon dioxide results in a high concentration of this gas in the deep groundwaters of the crystalline basement. Radiogenic-produced helium is enriched in these waters due to the long subsurface retention times. South of the Jura mountains, high concentrations of hydrogen sulphide in waters of the Upper Muschelkalk aquifer are related to the occurrence of hydrocarbons. The Malm, Upper Muschelkalk and Permian-Lower Triassic aquifers and locally that of the crystalline basement are all separated by hydraulic barriers as demonstrated, for example, by the Weiach borehole. Waters of each of the different aquifers can be clearly distinguished from their hydrogeochemistry. The NaCl-character of the Malm aquifer water is attributed to marine formation waters that descended from the overlying Molasse sediments. Comparatively low mineralisation in the waters of the Upper Muschelkalk suggests that there is a significantly high flow rate in this aquifer. 3 refs., 3 figs., 5 tabs.

38167 **(USGS/MAP/I—1767) Geologic map of the quaternary and tertiary deposits of the Big Dune quadrangle, Nye County, Nevada, and Inyo County, California.** Swadley, W.C.; Carr, W.J. (Geological Survey, Denver, CO (USA)). 1987. Contract AI08-78ET44802. 20p. NTIS, PC A03;3. Order Number DE88010834/JAW.

38168 **(USGS-OFR—87-617) Late Cenozoic evolution of the upper Amargosa River drainage system, southwestern Great Basin, Nevada and California.** Huber, N.K. (Geological Survey, Menlo Park, CA (USA)). 1988. Contract AI08-78ET44802. 26p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010306/JAW.

A major part of the upper Amargosa River drainage system is centered on Timber Mountain, a high central area within a volcanic caldera northeast of Beatty, Nevada, on the west margin of the Nevada Test Site. The basic drainage pattern in this area was established soon after caldera collapse and resurgent dome formation about 11 million years ago. The gross drainage pattern has changed little since then, although subsequent volcanic activity has temporarily blocked drainage channels. As there have been no significant changes in subbasin geometry, general tectonic stability of the region during this time is implied. A major change in alluvial regimen occurred with the end of major alluvial-fan construction within the drainage system and the beginning of fanhead erosion that formed incised washes. The size and shape of incised channels differ, but they show a similar relation to the geomorphic parameters of their respective drainage basins—including such diverse-appearing washes as the deep Fortymile Wash and the wide, shallow wash on the Amargosa River downstream from Beatty. If the subbasin drainages have not changed appreciably during the Quaternary, then the forcing mechanism for the change in alluvial regimen is most likely either climatic or tectonic. Because this change appears to have occurred at about the same time throughout the upper Amargosa River drainage system, a climatic cause is preferred; its nature and timing are still speculative, but probably was increasing aridity that reached a threshold in the middle Pleistocene. This analysis also concludes that a postulated Pleistocene drainage capture by the Fortymile Canyon drainage system did not occur and that a large Pliocene lake in the Amargosa Desert, the postulated "Lake Amargosa", is equivocal.

38169 **(DOE/ER/13628—T1) Shallow-crustal magma zones in and south of Long Valley, California: Final report for the period 1 Sept 1986 to 30 April 1988.** Peppin, W.A. (Mackay School of Mines, Reno, NV (USA). Seismological Lab.). 25 Apr 1988. Contract FG08-86ER13628. 8p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009214/JAW.

This report summarizes our investigations of seismic data from the Long Valley caldera region based mainly on data obtained from the USGS-Doe seismic network. During the period several thousands of earthquakes were recorded and located, including the extensive aftershock sequence of the July 1986 Chalfant Valley. This contract has provided partial operating support for this network, including the establishment of the first permanently-recording wideband digital station in the Mammoth Lakes region. Results presented here unclude five manuscripts involving various aspects of the research. These manuscripts cover: (1) a general description of unusual seismic phase near Mammoth Lakes and their possible use in the delineation of shallow-crustal anomalous bodies, (2) a paper which pinpoints the location of a shallow-crustal anomaly about 6 km deep and 2 to 3 km in lateral near the south end of Hilton Creek fault, (3) the documentation of a strong lateral structural change in the vicinity of Inyo Craters, and (4) papers contributing to knowledge of the tectonics of the Mammoth Lakes area.

38170 **(DOE/ET/44802—T22) Aeromagnetic map of Nevada: Caliente sheet.** Saltus, R.W.; Snyder, D.B. (Nevada Bureau of Mines and Geology, Reno (USA); Nevada Univ., Reno (USA). Mackay School of Mines; Nevada Univ., Reno (USA)). 1986. Contract AI08-78ET44802. 13p. NTIS, PC A03;3. Order Number DE88008625/JAW.

Two maps are presented, one at 1:250,000 displaying the residual magnetic field for four separate surveys, and one at 1:1,000,000 adjusting the datums to a common elevation and merging the surveys. (ACR).

38171 **(DOE/RL/70039—10) Earthquake monitoring of eastern and southern Washington: Annual technical report 1985.** (Washington Univ., Seattle (USA). Dept. of Geophysics). Sep 1985. Contract AS06-75RL70039. 79p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010541/JAW.

This report covers the operations and research performed on the seismicity and structure of eastern and southern Washington and northern Oregon for the year, July 1, 1984 to June 30, 1985.

38172 **(DOE/RL/70039—11) Earthquake monitoring of eastern Washington: Annual technical report 1986 [July 1, 1985-June 30, 1986].** (Washington Univ., Seattle (USA)). Oct 1986. Contract AS06-75RL70039. 52p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010540/JAW.

This report covers the operations and research performed for DOE by the University of Washington Geophysics Program on the seismicity and structure of eastern Washington and northeastern Oregon for the year, July 1, 1985 to June 30, 1986. There are presently 111 stations in Washington and northeastern Oregon whose data are telemetered to the University for recording, analysis and interpretation. Section I covers the operation of the network including station maintenance, data processing and telemetry problems in eastern Washington and the Washington-Oregon border area. A fairly detailed description of the switch to BPA microwave telemetry is included. The seismicity of the past year and a description of the catalog is covered in Section II. Section III is a description of our experiments with an earthquake location routine for eastern Washington using a velocity structure including a low-velocity zone. Section IV gives the detailed results of our re-calibration of the USGS amplitude magnitude scale used between 1969 and 1974 for magnitude determinations in eastern Washington. Section V is an exploration of techniques to improve timing accuracy and relative locations are studied using a well recorded swarm of earthquakes in the Cascades. The appendix includes the catalog of earthquakes located in eastern Washington during this year and a table of station outages.

38173 **(DOE/RL/70039—12) Earthquake monitoring of eastern Washington: Annual technical report, 1987.** Malone, S. (ed.). (Washington Univ., Seattle (USA). Dept. of Geophysics). Oct 1987. Contract AS06-75RL70039. 80p. NTIS, PC A05;3. Order Number DE88010539/JAW.

This report covers operations and research on the seismicity and structure of eastern Washington and northeastern Oregon for the year, July 1, 1986 to June 30, 1987. The report covers the operation of the regional seismograph network including station maintenance and calibration, data processing and operational problems. A detailed description of the current network including telemetry routing through the BPA microwave system is included. This section also details a new VCO system developed to improve the center-frequency stability and reliability of our field stations. The seismicity of the past year and a description of the catalog is covered.

38174 **(LBL—21814) Inversion of static displacement of the earth's surface.** Vasco, D.W. (Lawrence Berkeley Lab., CA (USA)). Aug 1986. Contract AC03-76SF00098. 111p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE88011886/JAW.

A method is presented which uses observations of surface displacement to place constraints on the components of the strain tensor at depth. Using a volume integral form of Volterra's integral and a series expansion method, the problem is discretized. An extremal inverse approach is described allowing the calculation of bounds on model parameters from bounds on the data. Methods of placing bounds on generalized moments of the perturbing body are developed, and techniques of handling errors in the data are discussed. A special case, the use of uplift measurements to bound fractional volume change in the subsurface, is developed. The connection between extremal bound techniques and the method of ideal bodies is explored. As an application, uplift data from 1982, 1983 and 1985, are used to constrain the depth and horizontal extent of any possible magma intrusion at depth. It was found that, in order to satisfy the 1982, 1983 and 1985 uplift data, volume ex-

pansion was required above depths of 11, 9 and 8 kilometers respectively. Furthermore, bounds on fractional volume change of individual blocks were calculated. Finally, a method is developed which determines multiple solutions to non-linear inverse problems. An extension of Newton's method for non-linear optimization, the algorithm projects through solutions and searches for additional ones. The technique is applied to finding best fitting polyhedral volume source for a given displacement anomaly. This method has applications in many areas of geophysics.

38175 **(LBL—24928) A code to compute borehole fluid conductivity profiles with multiple feed points.** Hale, F.V.; Tsang, C.F. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 54p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88008401/JAW.

Investigators wish to determine the flow characteristics of fractures intersecting a wellbore to understand the hydrologic behavior of fractured rocks. Often inflow from these fractures into the wellbore is at very low rates. A new procedure has been proposed and a corresponding method of analysis developed to obtain fracture inflow parameters from a time sequence of electric conductivity logs of the borehole fluid. The present report gives the details of equations and computer code used to compute borehole fluid conductivity distributions. Verification of the code used and a listing of the code are also given. 9 refs., 5 figs., 7 tabs.

38176 (NAGRA-NTB—87-15, pp 287-303) **Tectonic evolution of Northern Switzerland.** Laubscher, H. (Basel Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

The tectonic evolution of Northern Switzerland is characterized by a superposition of events, with the preceding ones strongly influencing their successors. The oldest, stratigraphically documented one is the late Paleozoic trough of Constance-Frick. It was recently discovered on reflection lines and in drill holes. Seismic evidence suggests a dextrally-transpressive belt with occasional transtensive episodes and rapidly varying depths, reaching down to 7 km. This picture fits into the frame of a broad dextral transform belt between the Appalachians and the Urals which has been postulated for this time interval. Before the transgression of the Mesozoic the relief was reduced to a peneplain, and this was followed by rather quiet subsidence that lasted for almost 200 my, although probably interrupted in the Cretaceous. It was followed by renewed tectonic activity in the Paleogene. Between the late Eocene and the early Miocene there was a largely extensional period which is documented for the Alps and their northern, western and southern foreland. In this period, a number of the Paleozoic fault zones were reactivated, mainly as comparatively gentle flexures which were accentuated by minor faults. This relief was peneplained again before the Langhian. With the middle Miocene, an entirely new tectonic situation originated ('Miocene revolution'). The stress field was re-oriented. In the area of the southern Rhinegraben a large dome, rooting in the lithosphere, began to rise (Black Forest-Vosges dome). The Alps began again a part of the compressive Africa-Europe plate boundary (Neo-Alps). Their northern front progressively penetrated the foreland, and their final addition, in the late Miocene, was the decollement nappe of the Jura. The sole of this thrust sheet had been strongly disturbed by the Paleogene deformations. 46 refs., 8 figs.

38177 (NAGRA-NTB—87-15, pp 323-334) **Cataclasis in the crystalline basement of Northern Switzerland.** Meyer, J. (Bern Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

In the crystalline basement of Northern Switzerland two main phases of cataclastic deformation can be distinguished: a 'cataclasis 1' in a higher temperature hydrothermal regime, as a consequence of tectonic and magmatic-hydrothermal events in Upper Carboniferous time and a lower temperature 'cataclasis 2', which can be related to Permian tectonics at the northern margin of the Paleozoic Konstanz-Frick trough. These cataclases are interpreted as a result of longlasting and complex tectonic processes at shallow crustal levels. (author) 30 refs., 4 figs.

38178 (NAGRA-NTB—87-15, pp 383-395) **Diagenesis of Buntsandstein and its relation to the tectonic evolution of Northern Switzerland.** Ramseyer, K. (Bern Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

In Northern Switzerland a large southward extension of Buntsandstein sediments below the Jura mountains is recorded from six Nagra boreholes and the Pfaffnau 1 oil exploration well. Most of the sediments comprise reworked quartz rich sandstones deposited in a fluvial environment. During eogenesis pedogenic processes modified the sediments under semiarid conditions with the localized displacive growth of nodular carbonate, sulphate and chalcedony. Clay introduced by mechanical infiltration was penecontemporaneously reddened. Two cycles of precipitation dissolution took place during mesogenesis. Both cycles include precipitation of quartz, carbonate and sulphate, and additionally, in the second cycle, kaolinite and locally a variety of ore minerals. During formation of secondary porosity both potassium feldspar and authigenic cements were partially dissolved. Late tectonic fractures are now cemented with quartz, chalcedony and calcite. Fluids responsible for the formation of secondary porosity are inferred to have migrated along fractures from the underlying organic rich Permo-Carboniferous sediments during stages of maximum burial and inversion. Following inversion, a final generation of secondary porosity developed throughout the Buntsandstein by dissolution of calcite and anhydrite. This dissolution is related to an influx of low salinity waters. (author) 29 refs., 10 figs.

38179 (NAGRA-NTB—87-15, pp 461-472) **On seismotectonics of Northern Switzerland.** Pavoni, N. (Eidgenoessische Technische Hochschule, Zurich (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Comparison of focal mechanisms with local neotectonic structures in Northern Switzerland shows, in many cases, a good correlation between the orientation of nodal planes of the fault-plane solutions and the orientation of fault systems observed at the surface. Focal depths of 10-30 km indicate that some of these fault systems cut deep into the crystalline basement and even through the whole crust. From the orientation of P-axes and T-axes it is concluded that the crust of northern Switzerland is undergoing a NNW-SSE maximum horizontal shortening and a WSW-ENE maximum horizontal extension. The orientation of the stress field which causes the present seismicity in northern Switzerland is very similar to that of the stress field of the last 5 to 8 million years which produced the neotectonic deformation. (author) 22 refs., 3 figs., 1 tab.

38180 (NAGRA-NTB—87-15, pp 473-489) **Decoupling of the tectonic stress field at the Jura overthrust.** Mueller, W.H.; Bluemling, P.; Becker, A.; Clauss, B. (Nationale Genossenschaft fuer die Lagerung Radioaktiver Abfaelle (NAGRA), Baden (Switzerland); Karlsruhe Univ. (T.H.) (Germany, F.R.)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

This study documents the three-dimensional structure of the tectonic stress field in northern Switzerland. Investigations in the basement are in good agreement with other studies of the stress field in Central Europe (135 degrees), also significant rotations of the stress field were observed in the sediments. Minor rotations of the stress tensor are attributed to local effects of the concealed Permo-Carboniferous (horizontal stress direction 160 degrees) trough beneath northern Switzerland while a more pronounced change of the orientation of the stress field is apparent in the sediments south of the Jura collision front (horizontal stress direction 10 degrees). This rotation is possibly due to a decoupling of the stresses by the decollement horizon within the evaporate series of the Keuper and the Mittlere Muschelkalk. (author) 40 refs., 8 figs., 1 tab.

38181 (NAGRA-NTB—87-15, pp 491-508) **Method for estimation of tectonic shear strain based on microstructural observations.** Jordan, P. (Basel Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

The relative competence between certain rocks or minerals inverts when particular confining conditions are reached. Anhydrite, for example, deforms at a higher stress level in the cataclastic field than clay. With increasing burial depth, anhydrite enters the field of crystal plasticity and its strength decreases rapidly, while clay keeps on deforming by cataclasis at increasingly higher stresses and becomes finally stronger than anhydrite. This inversion of strength is a function of temperature, pore pressure, confining pressure as well as of strain rate. The inversion of relative competence may, therefore, be used as a valuable dynamic indicator, provided that the ambient conditions effective during deformation are sufficiently known. Based on experimentally deduced flow laws, equilibrium point maps may be calculated for the maximum or minimum strain rate implied by the observed microstructures. The map presented here allows a good estimation of the influences of all the uncertainties in pressure or temperature on the critical strain rate. An application of the anhydrite-clay equilibrium point map on the detachment horizon of the Eastern Jura Mountains (NW Switzerland) implies a maximum simple shear strain rate of ca. $3x10^{-14}s^{-1}$, or ca. $6x10^{-12}s^{-1}$, depending upon the differing paleo-temperature estimates. The first estimate is based on the present geothermal gradient, while the second one is based on fluid inclusions which are considered to be related to the Miocene detachment. (author) 28 refs., 5 figs.

38182 (NAGRA-NTB—87-15, pp 509-519) **Indications of neotectonic crust motion in Northern Switzerland.** Haldimann, P. (Geologisches Buero Dr. Heinrich Jaeckli AG, Zurich and Baden (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Indications of possible Pleistocene and Holocene tectonic activity in northern Switzerland have been found by an analysis of irregular erosional forms in the subcrop, abnormal gradients of accumulative gravel terraces and particular developments of the river course. (author) 6 refs., 3 figs., 1 tab.

38183 **(PB—88-196613/XAB) Nonseismic, surface geophysical, and geochemical prospecting technolygy. Final report, November 1986-November 1987.** Curtis, J.B.; Gevirtz, J.L. (Exlog/Brown and Ruth Labs., Inc., Englewood, CO (USA)). Dec 1987. 107p. NTIS, PC A06/MF A01.

The exploration value of detecting low concentrations of hydrocarbons entrapped in soils has been subject to considerable debate. Proponents of the various methods assert that microseepage involves vertical migration of hydrocarbons, a mode of hydrocarbon movement that is different than that documented for macroseeps. Earlier studies have suffered from less-than-rigorous sampling designs that lead to statistically untestable conclusions. And no universally acceptable genetic models that quantitatively relate asserted causes, mechanisms, and effects of microseepage have been defined. A series of experiments to complete an objective study are outlined in the document. The objective study is designed to: (1) Rigorously establish the genetic relationship between measurement of soil hydrocarbon populations and postulated soil alteration products and their geophysical and remote-sensing expression. This would allow us to: (2) Determine what these surface measurements tell us about the hydrocarbon character, geology and hydrodynamics of the subsurface. Results of such an experiment could then be used to: (3) Test the concept of vertical hydrocarbon migration and improve the application of microseep detection methods.

38184 **Inversion of regional Pnl and surface-wave data for source parameters of a Borah Peak aftershock.** Patton, H.J.; Doser, D.E. (Lawrence Livermore National Laboratory, California). *Geophysical Research Letters;* **15**: No. 5, 459-462(May 1988).

We present results of a comparative source study on one of the largest aftershocks of the Borah Peak, Idaho, earthquake series. The mechanism of this event had been previously studied using first motions and teleseismic p-wave data, and we report here our results from analysis of regional Pnl and surface waves. The Pnl waves gave an estimate of the source duration near 5 sec, in agreement with the teleseismic p-waves. Both the source duration and the effect of surface-wave dispersion through laterally heterogeneous crustal structures must be accounted for in the moment-tensor inversions of intermediate-period surface waves. All data sources, both long period and short, gave consistent source mechanisms, and the long periods also yield three independent and consistent source mechanisms, and the long periods also yield three independent and consistent estimates of the seismic moment. The results demonstrate the promise of formal source-parameter retrieval techniques applied to regional data for the study of earthquakes with magnitudes below the magnitude threshold of teleseismic source determinations. copyright American Geophysical Union 1988

38185 **(CONF-8805139—1) Some equivalent circuit models for AC impedance analysis of pyrite/solution interface.** Chander, S.; Pang, J.; Briceno, A. (Pennsylvania State Univ., University Park (USA). Dept. of Mineral Engineering). 1988. Contract FG22-85PC80523. 17p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010574/JAW.

From Symposium on electrochemistry in mineral and metal processing; Atlanta, GA, USA (15 May 1988).

Several equivalent circuit models are considered for analysis of the AC impedance spectra of pyrite/solution interface. These models take into account the presence of coating layers and the contributions from surface roughness and diffusion. An optimization procedure is described to estimate the parameters of the equivalent circuit, namely, the value of various resistors and capacitors. The procedure can also be used to identify the equivalent circuit which best describes the measured impedance spectra. The impedance results of a pyrite electrode in sodium carbonate and borate solutions are analyzed in terms of the parameters of an equivalent circuit. Such an analysis can be used to distinguish the type of processes which control reactions at the electrode.

38186 **(INIS-BR—1091) Patterns in the rare earth elements of the Serra do Carambei granite (Parana) and the others associated ignous rocks.** Pinto-Coelho, C.V.; Marini, O.J. (Brasilia Univ. (Brazil). Dept. de Geociencias). 1986. 11p. (In Portuguese). (CONF-8610278—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702788/JAW.

From 34. Brazilian congress of geology; Goiania, Brazil (12 Oct 1986).

The rare earth elements (REE) distribution patters in igneous rocks of the Serra do Carambei Granite area (Parana) were a very important tool to elucidate the genetic processes and the cogenetic relationships between these rocks. The porphyroid facies of the Cunhaporanga Granitoid Complex has a REE distribution pattern characterized by decreasing concentrations in direction to the heavy rare earth elements (HREE) and the smooth Eu negative anomalie, compatible with amphibole fractionation during the magma ascent and the incipient plagioclase fractionation. The REE pattern of the Serra do Carambei Granite is characterized by the strong Eu negative anomalie, by the light rare earth element (LREE) depletion and by the HREE increase. This shape of the REE patterns is frequently observed in Sn-W granites, according to French authors. However in the igneous rocks of the Serra do Carambei Granite area this is not true. "Rhyolite" dytes intrusives in the Serra do Carambei Granite exhibit REE pattern similar to the wall rock, indicating then the same genetic processes. The Castro Group rhyolites have REE patterns with decreasing concentrations in direction to the HREE and smooth Eu negative anomalie. The REE distribution patterns is against the consanguinity between the "rhyolites" intruded in the Serra do Carambei Granite and the rhyolites of the Castro Group and also between these rhyolites and the above mentioned Granite.

38187 (LBL—25311) Crack models for the failure of rocks in compression. Kemeny, J.M.; Cook, N.G.W. (Lawrence Berkeley Lab., CA (USA)). Dec 1986. Contract AC03-76SF00098. 15p. (CONF-870103—7). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012217/JAW.

From 2. international conference on constitutive laws for engineering materials; Tucson, AZ, USA (5 Jan 1987).

Fracture mechanics models are developed to analyze the post failure behavior of rocks under triaxial compression. We consider axially aligned sliding cracks as a model for the axial growth of microcracks and a collinear row of shear cracks at an angle to the direction of maximum compression, as a model for shear failure. It is found that the sliding crack model exhibits strain hardening and strain softening, while the shear crack model exhibits only strain softening. Also, we consider parallel columns of sliding cracks, and show that parallel interaction stabilizes the axial growth of cracks.

38188 (LBL—25312) Fracture stiffness and aperture as a function of applied stress and contract geometry. Hopkins, D.L.; Cook, N.G.W.; Myer, L.R. (Lawrence Berkeley Lab., CA (USA)). May 1987. Contract AC03-76SF00098. 11p. (CONF-870625—20). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012022/JAW.

From 28. U.S. symposium on rock mechanics; Tucson, AZ, USA (29 Jun 1987).

An analytical model that assumes variable height asperities and full interaction between them has been developed and implemented numerically to study the behavior of a single fracture under stress. The model has been used to calculate specific stiffness and aperture profiles for specified fracture geometries. The formulation takes account of the deformation of the half-planes defining the fracture which is shown to lead to changes in aperture geometry that are not predicted by other asperity models. A parameter sensitivity stud shows that specific stiffness varies significantly depending on the size of the asperities, their height distribution, and their spatial orientation. Curves of stress vs. specific stiffness generated with the model are found to agree in shape and magnitude with those obtained in the laboratory for rock specimens.

38189 (NAGRA-NTB—87-15, pp 305-322) Crystalline of Northern Switzerland: petrography and hydrothermal transformations. Peters, Tj. (Bern Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

The petrography of the crystalline basement of Northern Switzerland, which is overlain by a sedimentary cover, was studied from cores of deep drillings. The gneisses encountered mainly consist of metapelites, originating from illitic clays and biotite-plagioclase gneisses of dolomitic marl composition. They are interbedded with pyroxene-bearing lime silicate rocks and amphibolites interlain with aplitic gneisses, the latter being interpreted as bimodal volcanic tuffs. These gneisses, together with coarse-grained orthogneisses, were metamorphosed in upper amphibolitic facies up to anatexis. The gneisses are intruded by Variscan granites and a basic suite of diorites, monzonites and syenites. Several types of granites could be discriminated which are related to granites in the southern Black Forest. The slightly older basic rocks must have originated from an alkali basalt magma strongly enriched in K, P, Ba and Sr, to which, apart from mantle material, either the lower crust or a subduction component contributed. Emphasis was laid on the study of the hydrothermal alterations which had affected the crystalline. Four stages could be recognized: 1. A pegmatitic-pneumatolytic phase characterized by the growth of muscovite at the expense of K-spar and biotite and by the occurrence of tourmoline. 2. A hot-hydrothermal stage, where the anorthite-rich cores of plagioclase were transformed into sericite, calcite and albite, and biotite transformed into chlorite, K-spar, a Ti-phase and fluorite. 3. The main hydrothermal stage, where plagioclase was argillized into illite/smectite interstratifications and illite or was albitized. 4. Calcite and quartz veins with clay minerals and associated fissures with siderite, celestite, baryte, sphalerite, galenit.

38190 Positional disorder of A-site cations in C2/M amphiboles: model energy calculations and probability studies. Docka, J.A.; Post, J.E.; Bish, D.L.; Burnham, C.W. (Harvard Univ., Cambridge, MA (USA)). *American Mineralogist;* 72: No. 9-10, 949-958(Sep-Oct 1987).

Positional disorder of cations occupying the A sites of C2/m amphiboles has been modeled using structure-energy minimization techniques. Model energy calculations show that, relative to a tremolite end member, local charge deficiency on the T, M4, or O3 sites or charge excess on the M2 sites due to cation substitution will cause cations occupying the A site to assume positions significantly different from the 2b (2/m) special position. Calculations suggest that when a local charge configuration in the second-nearest neighbors of the A-site cation can be related by a symmetry element or combination of elements, the position of the A-site cation that results in minimum energy lies on that element or combination of elements, either 2b (2/m), 4g (2), or 4i (m), whereas a locally asymmetric charge configuration will favor the A-site cation to occupy a general position, 8j. Positional disorder may also be caused by different A-site cation species occupying distinctly different positions. K atoms need not be constrained to the mirror plane. Limiting-case probability calculations combined with the above conclusions suggest that for both richterite and edenite, the most probable position for the A-site cation is the general position, 8j, although in a significant fraction of cases, the A-site cation will occupy the 4g (2), 4i (m), or 2b (2/m) special positions.

38191 Neutron and x-ray diffraction study of hydrogarnet $Ca_3Al_2(O_4H_4)_3$. Lager, G.A.; Armbruster, T.; Faber, J. (Univ. of Louisville, KY (USA)). *American Mineralogist;* 72: No. 7-8, 756-765(Jul-Aug 1987). Contract W-31-109-ENG-38.

The crystal structure of $Ca_3Al_2(_4D_4)_3$ was refined from time-of-flight neutron powder data collected at 300, 200, and 100 K. The D atom is located 0.906(1) A (300 K) from oxygens surrounding the vacant anti 4 tetrahedral site. With the complete replacement of Si^{4+} by $4H^+$ in the grossular structure, the tetrahedral d-O distance increases from 1.645 to 1.950 A. Structural adjustments in response to tetrahedral expansion include a decrease in the length of the shared octahedral edge relative to the unshared edge and a corresponding increase in the Ca(1)-O(4) distance in the dodecahedron. At low temperatures, the D tetrahedron rotates $\sim 1°$ about the anti 4 axis relative to the rigid oxygen tetrahedron and becomes slightly more regular. The O-D distances at 300 and 100 K are within one standard deviation. Single-crystal X-ray intensity data were also obtained at 300 K from the same sample used in the neutron-diffraction experiments. The short O-H distance (0.65 A) determined from the X-ray data is characteristic of mineral structures with non-H-bonded OH groups and OH groups with weak O-H...O interactions.

38192 Effects of quench methods on Fe^{3+}/Fe^{2+} ratios: a Moessbauer and wet-chemical study. Dyar, M.D.; Naney, M.T.; Swanson, S.E. (Univ. of Oregon, Eugene (USA)). *American Mineralogist;* 72: No. 7-8, 792-800(Jul-Aug 1987). Contract AC05-84OR21400.

The effect of quenching method on Fe^{3+}/Fe^{2+} ratios in three silicate glasses has been studied using natural rock compositions. Samples were equilibrated at high temperatures and then quenched into an air jet, a 4% H_2-96% Ar jet, or a brine and ice bath. The glasses were analyzed by both Moessbauer spectroscopy and a microcolorimetric technique to compare the results from these commonly used methods for Fe^{3+}-Fe^{2+} determinations. Because the glasses were low in Fe^{3+} content, both analytical methods determined Fe^{3+} estimates by difference, resulting in relatively large uncertainties. Within these uncertainties, estimates of Fe^{3+}/Fe^{2+} ratios determined by Moessbauer spectroscopy and microcolorimetry are the same. None of the quenching methods used was observed to produce significantly different partitioning of Fe^{2+} among tetrahedral and octahedral structural sites in the basalt glasses. The highest cooling rate (brine and ice bath) yielded the largest tetrahedral Fe^{2+} values. No observable effects of quenching rate were measured with the other glass compositions investigated.

Results of thermogravimetric analysis of basalt is discussed. Heat capacity, thermal conductivity and thermal expansion are specifically addressed. (CBS)

38194 (NAGRA-NTB—87-15, pp 553-568) Fluid inclusion investigations in Nagra's boreholes of Northern Switzerland. Mullis, J. (Basel Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

Fluid inclusions studied in quartz and calcite from 6 Nagra-boreholes and the oil exploration well Pfaffnau in northern Switzerland were used to evaluate the evolution of fluid composition and trapping conditions. The studied boreholes covered representative sections of the Tertiary, Mesozoic and Permo-Carboniferous sedimentary rocks in addition to the underlying crystalline basement. Two fluid groups were identified, one containing salt-poor NaCl-(KCl) fluids of Upper Carboniferous age, and a second group containing salt-rich to salt-poor $CaCl_2$-NaCl-($MgCl_2$) fluids trapped between Permian and Tertiary times. The inclusions of the first group were trapped at relatively high temperatures (100 degrees to 350 degrees C, rarely up to 400 degrees C) and low pressures (probably below 1 kbar). Their widespread occurrence along healed fractures in rock forming minerals of the crystalline basement and in detrital quartz grains of the Permo-Carboniferous and Triassic sandstones imply a tectonicthermic event on a regional scale during late Variscan orogeny. The second group of fluids comprises early salt-rich and late salt-poor inclusions. The inclusions were trapped between 30 degrees and 140 degrees C and are detected preferentially in fissure minerals and porefilling cements. The widespread occurrence of the salt-poor fluids along healed fractures inside the host minerals imply major tectonic events especially during Tertiary times. These tectonic events are probably responsible for increased fluid migration and possibly also for brine dilution. The two fluid groups display a considerable similarity with the high-temperaturelow-saliniferous Variscan fluid system of the Black Forest and Oberpfalz. (author) 44 refs., 5 figs., 2 tabs.

38195 (NAGRA-NTB—87-15, pp 579-592) $^{87}Sr/^{86}Sr$-ratios and Sr-contents of deep ground waters, minerals and rocks from the crystalline and the Trias of Northern Switzerland. Matter, A.; Peters, Tj.; Ramseyer, K. (Bern Univ. (Switzerland)). 1987. (In German). Nagra, CH-5401 Baden. (CONF-8610398—).

From Geology of northern Switzerland conference; Bern, Switzerland (9 Oct 1986).

In order to determine the origin of groundwaters and their interaction with the host rock, the amount and ratio of strontium isotopes in groundwaters, vein minerals, authigenic cements and whole rocks were measured in the crystalline basement and Triassic sediments of northern Switzerland. The groundwaters in the fractured basement aquifer generally show Sr-isotope ratios that range between 0.716 and 0.718. These ratios in the groundwaters are mainly determined by reaction with Sr-rich minerals that were formed during a Permian hydrothermal event. With minor exceptions, the Sr-isotope ratios of most vein minerals are not in equilibrium with those of the present groundwaters. The waters of the Buntsandstein aquifer are characterized by slightly lower Sr-isotope ratios and a higher Sr-content than in the corresponding basement aquifer waters. Buntsandstein waters are considered to have evolved from the waters of the basement aquifer through dissolution of calcite and sulphate present in the Buntsandstein. Although the Sr-isotope ratios in Buntsandstein vein minerals and waters are similar the relative amount of Sr (assuming equilibrium partitioning) suggests these vein minerals did not precipitate from the present waters. The much lower Sr-isotope ratio characteristic of waters in the Muschelkalk aquifer (0.708 to 0.709) readily distinguishes these from the Buntsandstein and basement waters. The low Sr-isotope ratios in the Muschelkalk waters are, however, higher than those measured from marine sulphates in the Muschelkalk, and may result from dissolution of dolomite and continental sulphates. Measured variations in the Sr-isotope ratios of successive authigenic minerals indicate that the Sr-isotope composition in the groundwaters fluctuated through geological time. 38196 Dissolution kinetics of quartz as a function of pH and time at 70°C. Knauss, K.G.; Wolery, T.J. (Lawrence Livermore National Lab., CA (USA)). *Geochimica et Cosmochimica Acta;* **52**: No. 1, 43-53(JaJan 1988). Contract W-7405-ENG-48.

A single-pass, flow-through apparatus was used to determine the dissolution rate of quartz at 70°C as a function of pH and time. Dissolution rate data were obtained over the pH range 1.4 to 11.8 in nine separate experiments each lasting 50 days. The quartz dissolution rates were defined by the silica release rate to solution. Speciation-solubility calculations using the geochemical modeling code EQ36 indicate that the fluid was maintained far from equilibrium with respect to quartz and well-undersaturated with respect to all possible secondary minerals in all runs. The dissolution rates were independent of pH at values (10/sup -15.3/ molcm^2 x s) consistent with the data of Rimstidt and Barnes (1980) up to approximately pH 6, but at higher pH the rates increased with increasing pH, proportional to a/sub H^+//sup -0.5/, being almost four orders of magnitude higher at pH 11.8. The rate constants for quartz dissolution at 70°C were 10/sup -15.3/ molcm^2 x s in the pH-independent region extending from acid through neutral solutions, and 10/sup -17.8/ molcm^2 x s in more alkaline solutions. Etch pits were strongly developed in the runs with the more alkaline solutions (pH $>$ 8), in which the rates were the highest. This appears consistent with a surface reaction-controlled dissolution mechanism.

38197 Calculation of the thermodynamic and transport properties of aqueous species at high pressures and temperatures: aqueous tracer diffusion coefficients of ions to 1000°C and 5 kb. Oelkers, E.H.; Helgeson, H.C. (Univ. of California, Berkeley (USA)). *Geochimica et Cosmochimica Acta;* **52**: No. 1, 63-85(Jan 1988). Contract AS03-83ER13100;FG03-85ER13419.

Accurate values of diffusion coefficients for aqueous species are a requisite for predicting mass transfer in many geochemical processes. Tracer diffusion coefficients can be calculated from the limiting equivalent conductances of ions using the Nernst-Einstein equation. A corresponding states approach yields an isothermal/isobaric correlation between the limiting equivalent conductances and the standard partial molal entropies of aqueous species and electrolytes. These correlations, together with an equation of state for the standard partial molal entropies of aqueous species and a modified Arrhenius representation of the limiting equivalent conductances of aqueous electrolytes, can be used to predict as a function of temperature and pressure the limiting equivalent conductances of many electrolytes of geologic interest for which no high pressure/temperature experimental data are available. Combining these estimates with the linear dependence of the logarithm of the ratio of the anion to cation transference number for NaCl on reciprocal temperature observed by Smith and Dismukes permits prediction of the limiting equivalent conductances of ions, and therefore tracer diffusion coefficients at temperatures and pressures to 1000°C and 5 kb. Values of these coefficients are given in tables for 30 monovalent anions, monovalent cations, and divalent cations of geologic interest at high temperatures and pressures. The diffusion coefficients increase with increasing temperature by $\sim$ two orders of magnitude from 0° to 1000°C. In contrast, they decrease slightly with increasing pressure.

38198 Diploptene in antarctic sediments. Venkatesan, M.I. (Univ. of California, Los Angeles (USA)). *Geochimica et Cosmochimica Acta;* **52**: No. 1, 217-222(Jan 1988). Contract AS03-76EV70134.

The presence of diploptene [17β(H),21β(H)-hop-22(20)-ene] in sediment cores from Bransfield Strait and McMurdo Sound, Ant-

arctica, is reported. The organic geochemical data for these sediments provide evidence for the authigenic marine origin of this hopene.

38199 **Thermodynamics of concentrated electrolyte mixtures and the prediction of mineral solubilities to high temperatures for mixtures in the system Na-K-Mg-Cl-SO_4-OH-H_2O.** Pabalan, R.T.; Pitzer, K.S. (Lawrence Berkeley Lab., CA (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 9, 2429-2443(Sep 1987). Contract AC03-76SF00098.

Mineral solubilities in binary and ternary electrolyte mixtures in the system Na-K-Mg-Cl-SO_4-OH-H_2O are calculated to high temperatures using available thermodynamic data for solids and for aqueous electrolyte solutions. Activity and osmotic coefficients are derived from the ion-interaction model of Pitzer (1973, 1979) and co-workers, the parameters of which are evaluated from experimentally determined solution properties or from solubility data in binary and ternary mixtures. Excellent to good agreement with experimental solubilities for binary and ternary mixtures indicate that the model can be successfully used to predict mineral-solution equilibria to high temperatures. Although there are currently no theoretical forms for the temperature dependencies of the various model parameters, the solubility data in ternary mixtures can be adequately represented by constant values of the mixing term Phi/sub ij/ and values of Phi/sub ijk/ which are either constant or have a simple temperature dependence. Since no additional parameters are needed to describe the thermodynamic properties of more complex electrolyte mixtures, the calculations can be extended to equilibrium studies relevant to natural systems. Examples of predicted solubilities are given for the quaternary system NaCl-KCl-$MgCl_2$-H_2O.

38200 **Volatilization, transport, and sublimation of metallic and non-metallic elements in high temperature gases at Merapi Volcano, Indonesia.** Symonds, R.B.; Rose, W.L.; Reed, M.H.; Lichte, F.E.; Finnegan, D.L. (Michigan Technological Univ., Houghton (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 8, 2083-2101(Aug 1987).

Condensates, silica tube sublimates and incrustations were sampled from 500-800°C fumaroles and lava samples were collected at Merapi Volcano, Indonesia in January-February, 1984. With decreasing temperature (800-500°C) there were five sublimate zones found in silica tubes: 1) cristobalite and magnetite; 2) K-Ca sulfate, acmite, halite, sylvite and pyrite; 3) aphthitalite, sphalerite, galena and Cs-K sulfate; 4) Pb-k chloride and Na-K-Fe sulfate; and 5) Zn, Cu and K-Pb sulfates. The incrustations surrounding the fumaroles are also chemically zoned. Bi, Cd, Pb, W, Mo, Zn, Cu, K, Na, V, Fe and Mn are concentrated most in or very close to the vent as expected with cooling, atmospheric contamination and dispersion. Incomplete degassing of shallow magma at 915°C is the origin of most of the elements in the Merapi volcanic gas, although it is partly contaminated by particles or wall rock reactions. Devolatilization of a cooling batholith could transport enough acids and metals to a hydrothermal system to play a significant role in forming an ore deposit. However, sublimation from a high temperature, high velocity carrier gas is not efficient enough to form a large ore deposit. Re, Se, Cd and Bi could be used as supporting evidence for magmatic fluid transport in an ore deposit.

38201 **Stability of illite/smectite during diagenesis: an experimental study.** Sass, B.M.; Rosenberg, P.E.; Kittrick, J.A. (Battelle, Pacific Northwest Labs., Richland, WA (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 8, 2103-2115(Aug 1987).

Illites from Goose Lake (Illinois) and Beavers Bend (Oklahoma) were equilibrated in 0.2 M and 2.0 M KCl solutions with excess kaolinite and either gibbsite, boehmite, quartz, or amorphous silica. Teflon-lined reaction vessels were used to heat the charges from 25° to 250°C at the vapor pressures of solution. Partial reversibility was demonstrated by approaching equilibria from both high and low K^+H^+ activity ratios. The experimental data were used to construct isothermal, isobaric activity diagrams [log (a/sub K^+/a/sub H^+/) vs. log a/sub SiO_2/] for the system K_2O-Al_2O_3-SiO_2-H_2O. Stability regions have been defined for kaolinite, boehmite, and three other phases that are believed to be components of both illites. At low temperatures (<90°C) illite-smectite equilibrium is metastable with respect to calculated kaolinite-microcline equilibrium. Between 90°C and 110°C a phase transition involving illite and smectite occurs which stabilizes the assemblages illite-smectite-kaolinite and illite-smectite-microcline. This transition occurs at the same temperature as the ordering transition in natural IS. Above 110°C the assemblage illite-smectite is again metastable with respect to kaolinite-microcline, but at 200°C and above illite and smectite may coexist stably with either kaolinite or microcline. However, smectite decomposes where a/sub SiO_2/ is controlled to quartz solubility yielding the stable assemblage illite-kaolinite-quartz and illite-mica-quartz.

38202 **Effect of pressure on aragonite dissolution rates in sea water.** Acker, J.G.; Byrne, R.H.; Yaakov, S.B.; Feely, R.A.; Betzer, P.R. (Univ. of South Florida, St. Petersburg (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 8, 2171-2175(Aug 1987).

Aragonite dissolution in sea water at variable pressure is well described by the equation Rate = kappa'([CO_3^{2-}]s - [CO_3^{2-}])/sup n/ where [CO_3^{2-}]s is the carbonate ion concentration at saturation, [CO_3^{2-}] is the observed carbonate ion concentration, and kappa' and n are empirical constants. Application of the equation Rate = kappa(1-Omega)/sup n/ to descriptions of aragonite dissolution rates is appropriate at constant pressure, temperature and salinity. The authors measurements in sea water at 5°C are consistent with the estimate - $\Delta V = 36.5$ cm^3mole for the volume change accompanying aragonite dissolution. This result is somewhat higher than laboratory estimates, but lower than estimates based on calcite and the difference between calcite and aragonite molar volumes.

38203 **High-resolution ^{23}Na, ^{27}Al, and ^{29}Si NMR spectroscopy of framework aluminosilicate glasses.** Oestrike, R.; Yang, W.H.; Kirkpatrick, R.J.; Hervig, R.L.; Navrotsky, A.; Montez, B. (Univ. of Illinois, Urbana (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 8, 2199-2209(Aug 1987). Contract FG02-85ER13437.

The results of high-resolution ^{23}Na, ^{27}Al, and ^{29}Si NMR spectroscopy of aluminosilicate glasses with MO/Al_2O_3 or $L_2O/Al_2O_3 = 1$ (M = +2, L = +1 cations) shows that these glasses have a fully polymerized tetrahedral framework structure with only a defect level of non-bridging oxygens. The chemical shifts of the peak maxima for all three nuclides become less shielded with decreasing Si/(Si + Al). For ^{29}Si and ^{27}Al, this variation parallels the variation of framework crystalline silicates. The ^{23}Na chemical shifts for the glasses becomes less shielded (less negative) with decreasing Na/(Na + K), opposite to the trend for crystalline alkali feldspars. Few data exist for the ^{23}Na chemical shifts of crystalline samples, and the structural causes of variation in ^{23}Na chemical shifts are not well understood. The ^{27}Al and ^{29}Si chemical shifts of the glasses do not vary significantly with different large (modifier) cations. The ^{29}Si chemical shifts provide estimates of average Si-O-T (T = Si, Al) bond angles and Si-O bond distances, and the ^{27}Al and ^{29}Si chemical shifts and peak breadths are consistent with a decrease in the tetrahedral ring order with decreasing Si/(Si +Al). The data presented here for fully polymerized glasses form a base from which the data for aluminosilicate glasses containing both fully polymerized sites and less polymerized sites can be interpreted.

38204 **Mineral recorders of pegmatite internal evolution: REE contents of tourmaline from the Bob Ingersoll pegmatite, South Dakota.** Jolliff, B.L.; Papike, J.J. (South Dakota School of Mines and Technology, Rapid City (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 8, 2225-2232(Aug 1987). Contract FG01-84ER13259;AC06-76RL01830.

Trace rare earth elements (REE) have been determined by radiochemical neutron activation analysis for tourmaline samples from an internally zoned, rare-element, granitic pegmatite, located in the Black Hills, South Dakota. The Total REE concentrations range from 40 ppm-0.2 ppm, and are highest in tourmaline from the exomorphic halo (country rock) and pegmatite border zone. Chondrite-normalized patterns are highly fractionated from light REE to heavy REE; and REE concentrations decrease in tourmaline from the outer wall zone and first intermediate zone, through the inner wall zone and third intermediate zone, to lowest levels in the pegmatite core. The REEs, as recorded by tourmaline, appear to

behave compatibly in this pegmatite system due to early crystallization of apatite and other possible REE-sink minerals. The large range of REE concentrations and differences in slopes of chondrite-normalized patterns probably also reflect significant changes in the structural state of the pegmatite melt, caused by changes in pH_2O and other volatiles (B, F, P) as crystallization progressed. Tourmaline samples that appear to have been fluid-derived are HREE-depleted relative to coexisting silicate-melt-derived tourmaline. Tourmaline does not exhibit any strong preference for specific REEs, rather its REE content appears to reflect the REE content of the medium from which the tourmaline crystallized.

38205 Cycling of fallout (Pu, ^{241}Am, ^{137}Cs) and natural (U, Th, ^{210}Pb) radionuclides in Washington continental slope sediments. Carpenter, R.; Beasley, T.M.; Zahnle, D.; Somayajulu, B.L.K. (Univ. of Washington, Seattle (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 7, 1897-1921(Jul 1987).

This paper reports activity profiles of Pu isotopes, ^{241}Am, ^{137}Cs, ^{210}Pb, U and Th isotopes in Washington continental slope sediments from 332-1415 m water, identify major processes responsible for them, and compare results with those previously reported for Washington shelf sediments. Specific activities of all nuclides but ^{137}Cs are higher in slope surface sediments than shelf surface sediments. These higher specific activities, which are due to more efficient scavenging by finer grained particles and higher concentrations of dissolved nuclides in slope waters, do not cause proportionally higher slope sediment radionuclide inventories, because they are counterbalanced by 5-10 fold lower sediment accumulation rates on the slope. /sup 239,240/Pu activities and inventories in slope sediments correlate with those of excess ^{210}Pb, as in shelf sediments, but with higher ratios of ^{210}PbPu in slope deposits. ^{241}Am/sup 239,240/Pu activity and inventory ratios in slope sediments average twice ratios in shelf sediments, due primarily to greater particle affinity and preferential downward transport of ^{241}Am. AmPu activity ratios change little with depth in slope sediments, suggesting insignificant separation of the two nuclides during diagenesis. /sup 239,240/Pu^{137}Cs ratios are 2-3 times greater in slope than shelf sediments, due to a combination of preferential scavenging of Pu and greater ^{137}Cs loss b decay and desorption. PuCs activity ratios decrease with depth in more porous slope sediments, due to downward migration of ^{137}Cs.

38206 Thorium-uranium disequilibrium in a geothermal discharge zone at Yellowstone. Sturchio, N.C.; Binz, C.M.; Lewis C.H. III. (Argonne National Lab., IL (USA)). *Geochimica et Cosmochimica Acta;* **51**: No. 7, 2025-2034(Jul 1987). Contract W-31-109-ENG-38.

Whole rock samples of hydrothermally-altered Biscuit Basin rhyolite from Yellowstone drill cores Y-7 and Y-8 were analyzed for ^{230}Th, ^{234}U, ^{238}U, and ^{232}Th. Extreme disequilibrium was found, with (^{230}Th/^{234}U) ranging from 0.30 to 1.27. Values of (^{230}Th/^{232}Th) and (^{234}U/^{232}Th) define a linear correlation with a slope of 0.16 +/- 0.01, which corresponds to a (^{230}Th/^{234}) age of approximately 19 ka. The (^{230}Th/^{234}U) disequilibrium was apparently caused by U redistribution which occurred mostly at about 19 ka, and is not related simply to the relative degree of hydrothermal alteration and self-sealing of the rhyolite. Mass balance of U requires a large flux of U-bearing ground water through the rhyolite at the time of U redistribution; rough estimates of minimum water/rock ratio range from 10^2 to 10^4, for a range of possible ground water U concentrations. Conservative hydraulic calculations indicate that the required ground water flux could have occurred within a period of hundreds of years prior to self-sealing. The disequilibrium data are consistent with a model involving U redistribution during the initial stages of development of a geothermal discharge zone that formed in response to the hydrogeologic effects of glacial melting and unloading during the decline of the Pinedale Glaciation.

38208 (AD-A—190540/5/XAB) Role of atomic and molecular processes in the Critical Ionization Velocity theory. Murad, E. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). 1987. 13p. (AFGL-TR—88-0007). NTIS, PC A03/MF A01.

Pub. in Recent Studies in Atomic and Molecular Processes, 79-90(1987).

In formulating a theory for the structure of the solar system (meaning the formation of the planets with their individual satellites) Alfven (1954; Alfven and Arrhenius, 1975) postulated a simple intuitive concept, the Critical Ionization Velocity (CIV), to explain the condensation of matter in the early stages of the formation of the solar system. Since the original suggestion fo CIV, it has been invoked to explain such diverse phenomena as cometary plasma (Formisano et al., 1982; Galeev et al., 1986) and the shuttle glow (Papadopoulos, 1984). Evidence, particularly from space experiments, has been reviewed recently by Newell (1985). Other reviews (e.g. Sherman, 1973) have emphasized the plasma (the collective) aspects of the theory. This review attempts to provide a transition from the collective aspects of the plasma treatments to the microscopic (collisional) implications of the theory.

38209 (AD-A—190632/0/XAB) Structure of the extended emission in the infrared celestial background. Price, S.D. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). Jan 1988. 13p. (AFGL-TR—88-0039). NTIS, PC A03/MF A01.

Pub. in Optical Engineering, Vol. 27, No. 1, 075-085(Jan 1988).

The extended infrared celestial emission is due to three main sources: zodiacal dust, large discrete objects in the galaxy, and interstellar dust. As viewed from earth orbit, the thermal reradiation of sunlight absorbed by dust in the solar system produces a pervasive IR background that peaks roughly along the ecliptic plane, where the density of dust is highest. Much-smaller-scale structure was also observed in both the visual and infrared. Between 7 and 30 micrometers, H II regions are the brightest discrete objects in the galaxy. An additional emission mechanism is needed, however, to account for the shorter-wavelength observations. The galactic sources combine along the line of sight to produce an intense band of emission, centered on the galactic plane. Structure in all of these backgrounds creates a clutter problem for an orbiting IR telescope.

38210 (CEA-CONF—9204) Sensitiveness to cosmic radiation: on some aspects of data collection and their representation. Leray, J.L.; Musseau, O.; Marti, A.; Coic, Y. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)). Jul 1987. 20p. (In French). (CONF-870724—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752559/JAW.

From 24. annual conference on nuclear and space radiation in electronics; Snowmass, CO, USA (28 Jul 1987).

During simulation of cosmic radiation effects, the energy deposition by length unit is altered because of energy lowering along the range. This mechanism is illustrated by exhaustive data got from the microprocessor type 2901. Wrong conclusions may be deduced concerning behavior in space field. New representations of cross sections are presented; they lead to safer predictions on behavior in space environment.

38211 **(DOE/ER/40063—2) [Application of two-dimensional imaging to very high energy gamma ray astronomy]: Progress report, 1987-1988.** (Smithsonian Astrophysical Observatory, Cambridge, MA (USA)). [1988]. Contract AC02-82ER40063. 22p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010120/JAW.

The major accomplishment of this project was the development of a gamma camera for detection of very weak flux from the Crab Nebula. In addition, the detection of a pulsed flux from Hercules X-1 and the installation of a new high resolution camera are reported. 6 figs. (DWL)

38212 **(DOE/ER/40423—02-P8) Cosmological helium production simplified.** Bernstein, J.; Brown, L.S.; Feinberg, G. (Stevens Inst. of Tech., Hoboken, NJ (USA); Rockefeller Univ., New York (USA); Washington Univ., Seattle (USA); Columbia Univ., New York (USA). Dept. of Physics). 1988. Contract AS06-88ER40423. 39p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009578/JAW.

We present a simplified model of helium synthesis in the early universe. The purpose of the model is to explain clearly the physical ideas relevant to the cosmological helium synthesis, in a manner that does not overlay these ideas with complex computer calculations. The model closely follows the standard calculation, except that it neglects the small effect of Fermi-Dirac statistics for the leptons. We also neglect the temperature difference between photons and neutrinos during the period in which neutrons and protons interconvert. These approximations allow us to express the neutron-proton conversion rates in a closed form, which agrees to 10% accuracy or better with the exact rates. Using these analytic expressions for the rates, we reduce the calculation of the neutron-proton ratio as a function of temperature to a simple numerical integral. We also estimate the effect of neutron decay on the helium abundance. Our result for this quantity agrees well with precise computer calculations. We use our semi-analytic formulas to determine how the predicted helium abundance varies with such parameters as the neutron life-time, the baryon to photon ratio, the number of neutrino species, and a possible electron-neutrino chemical potential. 19 refs., 1 fig., 1 tab.

38213 **(FRCEA-TH—44) Two enigmas of stellar evolution: the solar neutrinos and 1987 a supernova.** Cahen, S. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France); Paris-7 Univ., 75 (France)). 30 Jun 1987. 126p. (In French). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753963/JAW.

Solar models have been compared, using more recent opacity tables. Parameters to enter have been reviewed (thermonuclear reaction rate and element abundance) and opacity coefficient has been corrected. Incertitude influence of parameters on model results has been estimated. Helium initial abundance deduced from our model is coherent with observation and other calculated values. Causes of differences between some models are elucidated. For 1987a supernova, a semi-analytical model of light curve is presented. Light curve of supernovae whose progenitor is a massive star with a low initial radius. Electron recombination can explain almost the whole light emission.

(Institute for Theoretical Physics, University of Stellenbosch, South Africa). 1987. (In Afrikaans). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

At the high temperature and density present in the cores of massive stars in the latter stages of their evolution matter is expected to be in equilibrium. Various methods describing this equilibrium and the resulting equation of state of stellar matter at extreme conditions are reviewed. From these descriptions the relative abundances of nucleons bound in nuclei and of unbound nucleons can be calculated, leading to predictions of the composition of collapsing stellar material.

38218 (INIS-mf—11223, pp 363-375) **Monopole bounds from the fast binary pulsar PSR 1953 + 29.** Drukier, A.K.; Raffelt, G.G. (Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

We consider the monopole contamination of the normal sequence, ca.1 M/sub sun/ companion star of the fast binary pulsar PSR 1953 + 29. We find that the photosphere of this star is practically monopole free,i.e. the number ratio r of photospheric monopoles to nucleons is $r < 3 \times 10^{-29}$. If the Rubakov effect exists at the predicted level, the much stronger limit $r < 1.2 \times 10^{-42}$ is obtained and the Galactic isotropic flux is bounded by $F < 1.3 \times 10^{-20}\,cm^{-2}\,sr^{-1}\,s^{-1}$. 43 refs.

38219 **(ITEP—87(1987)) Strange, quark and metastable neutron stars.** Krivoruchenko, M.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 13p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702404/JAW.

Observable consequences of possible existence of strange, quark, and metastable neutron stars are discussed. Bose condensation of dibaryons in dense nuclear matter is taken into account. The data on glitches from pulsar in Crab Nebula are used to obtain limits on binding energy of stable strange matter and on masses of dibaryon resonances. Scenario for two step collapse of supernova SN 1987 a is suggested. Masses of diagonal neutrinos are extracted from the data on second neutrino burst observed from supernova SN 1987 a. 24 refs.; 2 figs.

38220 **(JINR—R-13-87-404) Acoustic-optical detector of gravitational waves based on high-quality crystals.** Lyablin, M.V.; Shabalin, D.E. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 15p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702459/JAW.

Submitted to the journal Sov. J. Quant. Electron. .

A design of the detector of gravitational waves based on the optical interferometer with a crystal of high-quality acoustic and optical parameters as a sensitive element is analysed. The gravitational wave frequency being 10^7 rads^{-1}, the maximum Brown noise sensitivity of the detector to the gravitational flux is shown to be able to attain 10^{-2}-10^{-1} ergxcm^{-2}s^{-1} in the frequency band 2 x 10^{-4} Hz. 23 refs.; 3 figs.; 3 tabs.

38221 (LA-UR—88-1210) The classical nova outburst. Starrfield, S.G. (Los Alamos National Lab., NM (USA)). 11 Apr 1988. Contract W-7405-ENG-36. 30p. (CONF-8708243—1). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88009138/JAW.

From Multiwavelength astrophysics; Taos, NM, USA (11 Aug 1987).

The classical nova outburst occurs on the white dwarf component in a close binary system. Nova systems are members of the general class of cataclysmic variables and other members of the class are the Dwarf Novae, AM Her variables, Intermediate Polars, Recurrent Novae, and some of the Symbiotic variables. Although multiwavelength observations have already provided important information about all of these systems, in this review I will concentrate on the outbursts of the classical and recurrent novae and refer to other members of the class only when necessary. 140 refs., 1 tab.

38222 (LA-UR—88-1345) Uses of lunar sulfur. Vaniman, D.T.; Pettit, D.R.; Heiken, G. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 20p. (CONF-8804104—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009119/JAW.

From NASA symposium on lunar bases and space activities of the 21st century; Houston, TX, USA (5 Apr 1988).

Sulfur and sulfur compounds have a wide range of applications for their fluid, electrical, chemical and biochemical properties. Although low in abundance on the Moon ({approximately}0.1% in mare soils), sulfur is surface-correlated and relatively extractable. Co-production of sulfur during oxygen extraction from ilmenite-rich soils could yield sulfur in masses up to 10% of the mass of oxygen produced. Sulfur deserves serious consideration as a lunar resource. 29 refs., 3 figs.

38223 (LBL—25375) Astrophysical evidence on the equation of state. Glendenning, N.K. (Lawrence Berkeley Lab., CA (USA)). 3 Jun 1988. Contract AC03-76SF00098. 6p. (CONF-880639—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011960/JAW.

From International conference on contemporary topics in nuclear structure physics; Cocoyoc, Mexico (9 Jun 1988).

The current situation concerning supernova simulations and the theory of neutron star structure are studied with respect to what they tell about the equation of state. A new mechanism that could help power supernovae is suggested.

38224 (RAL—88-014) Solar wind on 1 November 1984: observations by the AMPTE-UKS spacecraft. Bryant, D.A.; Bingham, R.; Farrugia, C.J. (Rutherford Appleton Lab., Chilton (UK)). Jan 1988. 37p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753519/JAW.

Submitted to Journal of Geophysical Research.

The AMPTE-UKS spacecraft was well place to monitor the solar wind and its variations during the unusual compression of the earth's magnetosphere on 1 November 1984. Ions, electrons, magnetic fields and plasma waves observed between 0815 and 1300 UT upstream from the bow shock at geocentric distances of 14-19 Rsub(e) and magnetic local times ~ 0900 MLT are reported and assessed with respect to magnetopause and bow-shock crossings closer to the earth by the AMPTE-CCE.

38225 (SLAC-PUB—4606) Solar monopoles and terrestrial neutrinos. Frieman, J. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1988. Contract AC03-76SF00515. 4p. (CONF-8709275—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010677/JAW.

From Extra solar neutrino astronomy workshop; Los Angeles, CA, USA (30 Sep 1987).

Magnetic monopoles captured in the core of the sun may give rise to a substantial flux of energetic neutrinos by catalyzing the decay of solar hydrogen. We discuss the expected neutrino flux in underground detectors under different assumptions about solar interior conditions. Although a monopole flux as low as F/sub M/ {approximately} 10/sup {minus/24} cm/sup {minus/2} sec/sup {minus/1} sr/sup {minus/1} could give rise to a neutrino flux above atmospheric background, due to M{bar M} annihilation, this does not translate into a reliable monopole flux bound stronger than the Parker limit. 8 refs., 1 fig.

38226 (UCRL—98783) Dynamical evolution of cosmic strings. Bouchet, F.R. (Lawrence Livermore National Lab., CA (USA)). 11 May 1988. Contract W-7405-ENG-48. 12p. (CONF-8803113—2). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011724/JAW.

From 8. Moriond astrophysics meeting on dark matter; Les Arcs, France (6 Mar 1988).

The author have studied by means of numerical simulations the dynamical evolution of a network of cosmic strings, both in the radiation and matter era. Our basic conclusion is that a scaling solution exists, i.e., the string energy density evolves as t^{-2}. This means that the process by which long strings dump their energy into closed loops (which can gravitationally radiate away) is efficient enough to prevent the string domination over other forms of energy. This conclusion does not depend on the initial string energy density, nor on the various numerical parameters. On the other hand, the generated spectrum of loop sizes does depend on the value of our numerical lower cutoff (i.e., the minimum length of loop we allow to be chopped off the network). Furthermore, the network evolution is very different from what was assumed before), namely the creation of a few horizon sized loops per horizon volume and per hubble time, which subsequently fragment into about 10 smaller daughter loops. Rather, many tiny loops are directly cut from the network of infinite strings, and it appears that the only fundamental scale (the horizon) has been lost. This is probably because a fundamental ingredient had been overlooked, namely the kinks. These kinks are created in pairs at each intercommutation, and very rapidly, the long strings appear to be very kinky. Thus the number of long strings per horizon is still of the order of a few, but their total length is fairly large. Furthermore, a large number of kinks favors the formation of small loops, and their sizes might well be governed by the kink density along the long strings. Finally, we computed the two-point correlation function of the loops and found significant differences from the work of Turok.

38227 (UCRL—98784) Non-linear scale invariance in a cold-dark-matter universe. Bouchet, F.R. (Lawrence Livermore National Lab., CA (USA)). 11 May 1988. Contract W-7405-ENG-48. 7p. (CONF-8803113—1). NTIS, PC A02/MF A01; GPO Dep. Order Number DE88011725/JAW.

From 8. Moriond astrophysics meeting on dark matter; Les Arcs, France (6 Mar 1988).

The observed decomposition of the lowest (N = 3,4) N-point correlation functions in symmetrized (N - 1) products of two-point correlation functions suggest the possibility that the Universe may obey a specific scale invariance, at least in some range. Assuming that this scale invariance is strictly verified for all N, some specific predictions concerning the void probability function P(sub O), and more generally the count probabilities P(sub N), as well as the fractal dimensions of the system can be made. In this report, the authors investigate the possibility that the non-linear evolution in a CDM Universe indeed to such a scale invariance.

38228 (UCRL—98811) Evolution of heavy-element abundances in the galactic halo and disk. Mathews, G.J.; Cowan, J.J.; Schramm, D.N. (Lawrence Livermore National Lab., CA (USA)). May 1988. Contract W-7405-ENG-48. 8p. (CONF-8803113—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011736/JAW.

From 8. Moriond astrophysics meeting on dark matter; Les Arcs, France (6 Mar 1988).

The constraints on the universal energy density and cosmological constant from cosmochronological ages and the Hubble age are reviewed. Observational evidence for the galactic chemical evolution of the heavy-element chronometers is described in the context of numerical models. The viability of the recently discovered Th/Nd stellar chronometer is discussed, along with the suggestion

that high r-process abundances in metal-poor stars may have resulted from a primordial r-process, as may be required by some inhomogeneous cosmologies.

38229 **Limits on the neutrino magnetic moment from SN1987A.** Lattimer, J.M.; Cooperstein, J. (Department of Earth and Space Sciences, State University of New York at Stony Brook, Stony Brook, New York 11794). *Physical Review Letters;* **61**: No. 1, 23-26(4 Jul 1988).

A neutrino magnetic moment greater than 10/sup -12/μ/sub B/, the Bohr magneton, would have important implications for gravitational-collapse supernovae. Also, it has been suggested that μ/μ/sub B/∼10/sup -10/ might solve the solar neutrino problem. However, we show that the neutrino observations of SN1987A and general optical observations of supernovae set a firm upper limit of μ/μ/sub B/<5 x 10/sup -13/. This limit is about 100 times better than the best experimental determination and previous astrophysical limits, and 10—20 times better than a previous limit based on big-bang nucleosynthesis.

38230 **Asymmetries in the location of the Venus ionopause.** Phillips, J.L.; Luhmann, J.G.; Knudsen, W.C.; Brace, L.H. (Los Alamos National Laboratory, Los Alamos, New Mexico). *Journal of Geophysical Research;* **93**: No. A5, 3927-3941(1 May 1988).

Four large data sets of Venus ionopause observations, based on different definitions and observations by Pioneer Venus orbiter field and particle instruments, are compared. Regardless of the definition chosen, the ionopause is observed to be higher on average at dawn than at dusk. The results of an empirical ionosphere model and a data analysis technique which minimizes orbital bias are combined to show that most or all of this asymmetry results from the effects of orbital bias and uneven sampling of solar wind conditions. However, an additional asymmetry is found in which the ionopause is displaced in the direction opposite to the motional electric field of the solar wind. This effect is attributed to asymmetric pickup of exospheric ions by the electric and magnetic fields in the magnetosheath. This ion pickup interpretation can be understood in terms of a previously observed magnetosheath magnetic field asymmetry. Quantitative analysis indicates that the transverse momentum imparted by the solar plasma to pickup particles in their initial gyration is transmitted by the magnetosheath magnetic field to the ionosphere boundary. copyright American Geophysical Union 1988

38231 **Cosmic strings and the microwave sky. I. Anisotropy from moving strings.** Stebbins, A. (NASA/Fermilab Astrophysics Center, Batavia, IL (USA)). *Astrophysical Journal;* **327**: 584-614(Apr 1988).

A method is developed for calculating the component of the microwave anisotropy around cosmic string loops due to their rapidly changing gravitational fields. The method is only valid for impact parameters from the string much smaller than the horizon size at the time the photon passes the string. The method makes it possible to calculate the temperature pattern around arbitrary string configurations numerically in terms of one-dimensional integrals. This method is applied to temperature jump across a string, confirming and extending previous work. It is also applied to cusps and kinks on strings, and to determining the temperature pattern far from a strong loop. The temperature pattern around a few loop configurations is explicitly calculated. Comparisons with the work of Brandenberger et al. (1986) indicates that they have overestimated the MBR anisotropy from gravitational radiation emitted from loops. 24 references.

38232 **G54.1 + 0.3 - a new Crab-like supernova remnant.** Velusamy, T.; Becker, R.H. (Tata Institute of Fundamental Research, Udhagamandalam (India); Lawrence Livermore National Lab., CA (USA); California Univ., Davis (USA)). *Astronomical Journal;* **95**: 1162-1166(Apr 1988).

High-resolution multifrequency observations with the VLA and OSRT of the small-diameter flat-spectrum radio source G54.1 + 0.3 are presented. The filled-center brightness distribution, strong polarization at 6 cm, and flat radio spectrum (alpha of about -0.13) from 0.327 to 5 GHz confirm that G54.1 + 0.3 is a Crab-like supernova remnant. 22 references.

38233 **Cosmic string induced peculiar velocities.** Van Dalen, A.; Schramm, D.N. (NASA/Fermi National Accelerator Lab., Batavia, IL (USA)). *Astrophysical Journal;* **326**: 70-76(Mar 1988).

This paper considers the scenario of a flat universe with a network of heavy cosmic strings as the primordial fluctuation spectrum. The joint probability of finding streaming velocities of at least 600 km/s on large scales and local peculiar velocities of less than 800 km/s is calculated. It is shown how the effects of loops breaking up and being born with a spectrum of sizes can be estimated. It is found that to obtain large-scale streaming velocities of at least 600 km/s, it is necessary that either a large value for beta G mu exist or the effect of loop fissioning and production details be considerable. 32 references.

38234 **Collective emission of electromagnetic waves from astrophysical jets - ;uminosity gaps, BL Lacertae objects, and efficient energy transport.** Baker, D.N.; Borovsky, J.E.; Benford, G.; Eilek, J.A. (Los Alamos National Lab., NM (USA); California Univ., Irvine (USA); New Mexico Institute of Mining and Technology, Socorro (USA)). *Astrophysical Journal;* **326**: 110-124(Mar 1988).

A model of the inner portions of astrophysical jets is constructed in which a relativistic electron beam is injected from the central engine into the jet plasma. This beam drives electrostatic plasma wave turbulence, which leads to the collective emission of electromagnetic waves. The emitted waves are beamed in the direction of the jet axis, so that end-on viewing of the jet yields an extremely bright source (BL Lacertae object). The relativistic electron beam may also drive long-wavelength electromagnetic plasma instabilities (firehose and Kelvin-Helmholtz) that jumble the jet magnetic field lines. After a sufficient distance from the core source, these instabilities will cause the beamed emission to point in random directions and the jet emission can then be observed from any direction relative to the jet axis. This combination of effects may lead to the gap turn-on of astrophysical jets. The collective emission model leads to different estimates for energy transport and the interpretation of radio spectra than the conventional incoherent synchrotron theory. 54 references.

38235 **Effects of nuclear equation of state on general relativistic stellar core collapse models.** Van riper, K.A. (Los Alamos National Lab., NM (USA)). *Astrophysical Journal;* **326**: 235-240(Mar 1988).

The consequences of the equation of state above nuclear density, parameterized by a compressibility and an adiabatic index, for the strength of the reflected shock wave following core bounce in stellar collapse are studied using a hydrodynamic model. Particular attention is paid to the amplification of the shock strength when bounce occurs near those critical parameters which would result in continued collapse to the black hole. Comparisons are made to models where Newtonian hydrodynamics is assumed, and the relativistic effects are contrasted with the dependence on the homologous core mass. The dependence of the collapsed core mass (and the Newtonian shock strength) on the (constant) electron fraction Y(e) is shown. 22 references.

38236 **Dual nature of the supernova remnant G351.2 + 0.1.** Becker, R.H.; Helfand, D.J. (California, Univ., Davis (USA); Lawrence Livermore National Lab., CA (USA); Columbia Univ., New York, NY (USA)). *Astronomical Journal;* **95**: 883-886(Mar 1988).

The Galactic SNR G351.2 + 0.1 has been imaged at frequencies of 1.4, 5, and 15 GHz. The images reveal a source composed of two distinct components: a broken elongated shell measuring 4 x 6 arcmin and a central core about 15 arcsec in diameter. The two components are spectrally distinct. The shell has a nonthermal spectrum (alpha = -0.4) typical for Galactic SNRs, while the central core has an inverted spectrum (alpha = +0.27). The central core may be an analog of the Crab Nebula (a synchrotron nebula powered by a pulsar), but if so it is not typical of such objects. 10 references.

38237 **Pulsational stability of Wolf-Rayet stars.** Cox, A.N.; Cahn, J.H. (Los Alamos National Lab, NM (USA); Illinois Univ., Urbana (USA)). *Astrophysical Journal;* **326**: 804-812(Mar 1988).

Representative radial and nonradial pulsational modes of five WR star models are calculated. In agreement with Maeder (1984), a hydrogen-free 50-solar-mass model, evolved from an original main-sequence 120-solar-mass model, has a pulsationally unstable radial fundamental mode. All radial overtones are stable in this model, as is typical of massive He stars pulsationally driven by the epsilon effect at their centers. For the other four models, all with some residual surface hydrogen, no radial modes are unstable. Further, no unstable g-type nonradial modes are found for any of the five models. The nonradial modes have large amplitudes outside of the convective core, where they might be expected to be driven by the epsilon mechanism in their hydrogen-burning shells. However, their stability suggests that nonradial pulsations do not contribute to the extreme mass-loss rates observed for WR stars. Radial pulsations can occur for the hot He core burning (WNE, WC, and WO) WR stars, and could possibly cause mass loss, but only very late in their evolution. 22 references.

38238 **IRC + 10216 circumstellar envelope. I. Models for the dust and gas.** Keady, J.J.; Hall, D.N.B.; Ridgway, S.T. (Los Alamos National Lab., NM (USA); Hawaii Univ., Honolulu (USA); Kitt Peak National Observatory, Tucson, AZ (USA)). *Astrophysical Journal;* **326**: 832-842(Mar 1988).

Very high resoluton infrared spectra for the gas flow from the IRC + 10216 photosphere is interpreted using a detailed empirical model of the density, temperature, and velocity profiles of the gas. Amorphous carbon is shown to condense at about 3 stellar radii. Results give a mass-loss rate of 2 x 10 to the -5th solar masses/yr and suggest that most of the 2.3 micron CO absorption is produced by gas at distances greater than about 3 stellar radii. The CO column density into 3 stellar radii is found to be 2 x 10 to the 20th/sq cm, and the microturbulence in the region of 2-micron line formation is found to be about 1.0 km/s. 42 references.

38239 **IRC +10216 circumstellar envelope. II. Spatial measurements of the dust.** Ridgway, S.; Keady, J.J. (Kitt Peak National Observatory, Tucson, AZ (USA); Los Alamos National Lab., NM (USA)). *Astrophysical Journal;* **326**: 843-858(Mar 1988).

A detailed study has been performed of the spatial structure of the IRC +10216 dust shell in the wavelength range 1-5 microns. An occultation observed at 4.6 microns is deconvolved to provide a one-dimensional image. A radiometric analysis of the dust shell flux distribution is performed based on coeval photometry, leading to an estimate of the shell extinction, a decomposition of the flux into shell and stellar components, and an estimate of the temperature of the dust at the inner boundary of the shell. A simple, nonequilibrium, geometrical model of the shell is used to estimate the inner radius of the dust envelope, and detailed radiative equilibrium models based on realistic opacities and a two-component grain population are developed. The best estimates of model parameters are selected, and the limiting factors in the analysis are discussed. 18 references.

38240 **Directivity of 100 keV-1 MeV photon sources in solar flares.** Kane, S.R.; Fenimore, E.E.; Klebesadel, R.W.; Laros, J.G. (California Univ., Berkeley (USA); Los Alamos National Lab., NM (USA)). *Astrophysical Journal;* **326**: 1017-1031(Mar 1988).

Stereoscopic observations of 0.1-1.0 MeV photon sources in solar flares made with spectrometers aboard the ISEE 3 and PVO (Pioneer Venus Orbiter) have been analyzed to determine the directivity of the photon sources and its possible dependence on photon energy. During the period October 1, 1978-October 31, 1980, a total of 44 solar flares were observed simultaneously by the two instruments. Of these, 39 flares were in full view of both the instruments, the remaining five being partially occulted by the photosphere from the line of sight of at least one instrument. The view angles theta(P) and theta(I) of the PVO and ISEE 3 instruments with respect to the outward solar radius at the flare site varied from one flare to another and were in the range 9-88 deg. The difference between the two view angles varied from 1 deg to 66 deg. The observations of differential photon energy spectra averaged over more than about 16 s do not indicate any systematic directivity. In most flares the directivity of 0.1-1.0 MeV photon sources is found to be less than about 2.5. 34 references.

38241 **Cosmic string wakes and large-scale structure.** Charlton, J.C. (Chicago Univ., IL (USA); Cornell Univ., Ithaca, NY (USA)). *Astrophysical Journal;* **325**: 521-530(Feb 1988).

The formation of structure from infinite cosmic string wakes is modeled for a universe dominated by cold dark matter (CDM). Cross-sectional slices through the wake distribution tend to outline empty regions with diameters which are not inconsistent with the range of sizes of the voids in the CfA slice of the universe. The topology of the wake distribution is found to be spongy rather than cell-like. Correlations between CDM wakes do not extend much beyond a horizon length, so it is unlikely that CDM wakes are responsible for the correlations between clusters of galaxies. An estimate of the fraction of matter to accrete onto CDM wakes indicates that wakes could be more important in galaxy formation than previously anticipated. 42 references.

38242 **Model for the 1987 outburst of the recurrent nova U Scorpii.** Starrfield, S.; Sparks, W.M.; Shaviv, G. (Arizona State Univ., Tempe (USA); Los Alamos National Lab., NM (USA)). *Astrophysical Journal;* **325**: L35-L38(Feb 1988).

The paper presents simulations of the outburst of U Sco by accreting material, with a solar abundance of the CNO nuclei, at a rate of 1.1 x 10 to the -6th solar mass/yr onto a 1.35-solar mass white dwarf. This evolutionary sequence takes about 2.6 yr to reach runaway conditions and ultimately eject 4 x 10 to the -7th solar mass moving with speeds exceeding about 400 km/s. It is found that ejection occurred by radiation pressure rather than by explosive CNO burning. 22 references.

38243 **Interpretation of the gamma-ray bump from Cygnus X-1.** Liang, E.P.; Dermer, C.D. (Lawrence Livermore National Lab., CA (USA)). *Astrophysical Journal;* **325**: L39-L42(Feb 1988).

The strong 0.5-2 MeV gamma-ray bump of Cyg X-1 recently reported by HEAO 3 observers can be interpreted self-consistently as the emission from a hot (kT of about 400 keV) pair-dominated plasma. The emission region parameters are uniquely determined by the spectral fit and observed luminosity via the pair-balance condition, suggesting that the gamma rays are produced in the inner region of the accretion flow at the expense of the normal power-law hard X-rays. 27 references.

38244 **Positron annihilation in the Galactic center: "Cheshire cat" compton scattering and "excess continuum".** Bildsten, M.L.; Zurek, W.H. (Cornell University, Department of Physics. Ithaca, nY 14853). *AIP (American Institute of Physics) Conference Proceedings;* **155**: No. 1, 184-187(15 Apr 1987). (CONF-8610211—).

From Galactic Center conference; Berkeley, CA, USA (25 Oct 1986).

Two separate observations of the γ-ray spectrum originating from the Galactic Center were made by HEAO-3 in the fall of 1979 and in the spring of 1980. The 2γ 511 KeV annihilation line flux decreased by a factor of three over the corresponding six month period, whereas the excess γ-ray continuum below the 511 KeV line, often interpreted as 3γ decay of orthopositronium, barely changed. This apparent discrepancy in the temporal behavior makes it difficult to associate the bulk of the excess continuum with the 3γ decay of positronium. We will show that Compton scattering of the line and high energy radiation provides a natural explanation for the surprisingly small change seen in the excess continuum.

38245 **Origin of baryons in the Universe.** Kolb, E.W. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp 1 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

One of the most fundamental questions in cosmology is the origin of the matter in the Universe. This talk will highlight recent developments in the theory of the origin of the nucleons in the framework of the big bang model. It will be shown that about 10^{-35} seconds after the bang conditions were present to generate an asymmetry between matter and antimatter. This small asymmetry provides the key for the survival of nucleons in the big bang. All the nuclei, atoms, and people present in the Universe today are a result of events in the first 10^{-35} seconds of the Universe.

38246 **Primordial nucleosynthesis in a universe with nonlinear inhomogeneities.** Matzner, R.A.; Centrella, J.M.; Rothman, T.; Wilson, J.R. (Univ. of Texas, Austin (USA)). pp 6 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

A completely relativistic, nonlinear plane-symmetric hydrodynamics and general relativity code is used to give the geometrical evolution within which they compute cosmic nucleosynthesis of light isotopes through ^{4}He. (Plane symmetry provides realistic modeling of the geometrical evolution during this epoch.) Local enhancement or depression of the element abundance may persist to the present. Average abundances found are not identical to the predictions of homogeneous cosmologies, and local abundances fluctuate in the range 22% - 27%. These inhomogeneous models are consistent with all observational constraints, in particular with the observed isotropy of the microwave radiation background.

38247 **Status of solar neutrino measurements.** Davis, R. Jr. (Univ. of Pennsylvania, Philadelphia (USA)). pp 7 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

A radiochemical neutrino detector was built by Brookhaven National Laboratory in 1965-1967 to observe the neutrino flux from the Sun and thereby test the thermal fusion theory of the solar energy. The experiment depends upon the neutrino capture reaction nu/sub e/ + ^{37}Cl → ^{37}Ar + e$^-$ that produces the 35 day radioisotope ^{37}Ar. The experiment uses 615 metric tons of C_2Cl_4 as a neutrino capturing medium. The detector is located 1480 meters below the surface to reduce background effects from cosmic radiation. The ^{37}Ar is removed from the liquid by a helium purge, purified and the ^{37}Ar activity is measured in a miniature proportional counter. Results will be reported on 68 individual measurements performed during the period 1970-1985. The results will be discussed in relation to theoretical models of the sun, current ideas in neutrino physics, and solar activity.

38248 **Probing the possibility of a ^{12}C/^{13}C abundance gradient from observations of interstellar CH$^+$.** Hawkins, I. (Lawrence Livermore National Lab., CA (USA)). pp 11 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The author has obtained the interstellar ^{12}C/^{13}C isotope ratio in the neighborhood of the Sun, from very high signal-to-noise optical observations of CH$^+$ toward the stars zeta Oph, zeta Per, P Cyg, 20 Tau, and 23 Tau. They have found that the ^{12}CH$^+$/^{13}CH$^+$ abundance ratios toward four different lines of sight are uniform within 12%. They provide evidence in favor of a locally-homogeneous ISM and have calculated a weighted mean ^{12}C/^{13}C ratio of 43 +/- 4. The similarity among the ^{12}CH$^+$/^{13}CH$^+$ ratios determined in four interstellar clouds possessing different physical conditions, precludes the possibility that fractionation or selective photodissociation of CH$^+$ are taking place in these regions. Thus the observed ^{12}CH$^+$/^{13}CH$^+$ isotope ratios are representative of the ^{12}C/^{13}C ratios in the gas. Since the CH$^+$ molecule seems to be the most sensitive probe of ^{12}C/^{13}C in the diffuse interstellar medium, they are obtaining CH$^+$ observations at CTIO and at Lick Observatory toward more distant stars located up to 2.5 kpc from the Sun to probe the existence of a Galactic ^{12}C/^{13}C abundance gradient. Observations of the stars HD 183143, HD24432, and HD157038 are presented.

38249 **US aspect of the Russian Ga-Ge experiment.** Bowles, T.J. (Los Alamos National Lab., NM (USA)). pp 12 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

A collaboration between the Academy of Sciences of the USSR and the University of Pennsylvania and Los Alamos National Laboratory has been formed to carry out at Ga-Ge solar neutrino experiment at the Baksan Neutrino Observatory in the Caucaus Mountains in Russia. The primary US involvement is to provide a complete counting system to detect the decay of single ^{71}Ge atoms which are produced by inverse beta decay from solar neutrinos in 60 tons of gallium metal. The progress towards accomplishing this detection capability and other aspects of the US involvement will be presented.

38250 **Molybdenum-technetium solar neutrino experiment.** Wolfsberg, K.; Schroeder, N.C.; Rokop, D.J.; Curtis, D.B.; Bryant, E.A.; Cowan, G.A.; Haxton, W.C. (Los Alamos National Lab., NM (USA)). pp 12 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

By measuring ^{98}Tc produced through the ^{98}Mo(nu,e$^-$) reaction in a deeply buried molybdenum deposit, they will measure the time-averaged ^{8}B solar-neutrino flux over about 10 Myr. Comparison with the Davis experiment will allow testing of the prediction of periodic mixing of the solar core over long time intervals. The experiment will also explore matter-enhanced neutrino oscillations; it is sensitive in unique portions of the δm^2-$\sin^2$theta plane. To separate technetium from 5000-ton quantities of Henderson-mine ore, they have taken advantage of the normal commercial mining, milling, and roasting operations of the AMAX Corporation. Technetium should volatilize during the conversion of molybdenite to molybdic oxide. They intercepted the scrub stream of the flue gases with ion-exchange columns to recover the technetium. After further purification, the technetium will be measured mass-spectrometrically by a very sensitive negative-thermal-ionization method. Details and preliminary results are presented.

38251 **Significance of neutrino oscillations.** Rosen, P. (Los Alamos National Lab., NM (USA)). pp 13 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The observation of neutrino oscillations would be a clear and unambiguous signal for the existence of neutrino mass. Solar neutrinos, because of their long baseline and low energies, provide the most sensitive probe for masses in the meV and sub-meV range. Recent developments concerning matter oscillations, and now known as the MSW effect (Mikheyev-Smirnov-Wolfenstein), lead to a new interpretation of the Davis experiment and to the need for measurements beyond those planned in the gallium experiments. This new scenario will be described, and its use as a tool to distin-

guish between solar models and neutrino properties as the cause of the Davis anomaly will be emphasized.

38252 **Nuclear reactions during cosmic ray transport.** Woo, L.W.; Kwiatkowski, K.; Viola, V.E.; Wilson, W.G.; Fatyga, M.; Fields, D.E.; Bonser, D.; Viola, R.W.; Mathews, G.J.; Breuer, H.; Mignerey, A.C. (Indiana Univ., Bloomington (USA)). pp 14 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

In order to investigate models of cosmic-ray origins, it is essential to understand the modification of the primary cosmic-ray source composition due to nuclear reactions which occur during transport through the interstellar medium. For this purpose excitation functions for all nuclides produced in reactions between the heavy-element component of the galactic cosmic rays and the primary interstellar medium elements, H and He, are required. Here they report results of mass, energy, and angular distributions for all fragments with $A > 4$ produced in reactions of ^{1}H and ^{4}He ions with ^{12}C, ^{16}O, and ^{28}Si at 50-200 MeV. Data were obtained at IUCF using fast-timing techniques in conjunction with conventional detector techniques. Results will be compared with predictions of precompound and intranuclear cascade calculations. Implications for galactic-cosmic-ray origins will be discussed.

38253 **Ubiquitous meteorite isotopic anomalies in Ca, Ti, and Cr.** Niemeyer, S. (Lawrence Livermore National Lab., CA (USA)). pp 15 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Discussions of isotopic anomalies usually focus on the several known FUN inclusions of Allende since most analyzed-elements in these samples show isotopic anomalies. In contrast, this review will consider only the anomalies which are commonly present in refractory Allende inclusions. Other than oxygen, such ubiquitous anomalies are presently resolved only in Ca, Ti, and Cr. The isotopic patterns in all 3 elements are consistent with a relative enrichment of the heaviest isotope. Smaller Ti anomalies are also found in whole-rock samples of most carbonaceous chondrites and in many of the chondrules from Allende, and in some chondrules from ordinary chondrites. The dominant anomalies at the neutron-rich isotopes indicate a single exotic component. The most likely source is neutron-rich hydrostatic burning at densities and temperatures found near the cores of massive stars. It is far from clear, though, how these nuclei are transported from the star through the ISM and then inhomogeneously distributed in solar system matter. Important factors are probably a refractory carrier phase for these neutron-rich isotopes and a chemical memory in the solar nebula whereby the dust component retains memories of its various nucleosynthetic origins and its subsequent history in the ISM.

38254 **Nucleosynthesis and supernovae produced by late time neutrino heating.** Mayle, R.W.; Wilson, J.R. (Univ. of California, Livermore (USA)). pp 22 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The composition of matter injected into the interstellar medium by supernovae is determined partly by the physics of the explosion and partly by the evolutionary history of the progenitor star. This talk will discuss the role of the explosion itself in determining elemental abundances of the ejecta, focusing on core collapse supernovae (typically associated with observational Type II events). In particular, the nucleosynthesis produced by progenitor stars with mass greater than 25 solar masses and exploding by the late time neutrino heating mechanism will be discussed.

38255 **Influences of the astrophysical environment on nuclear decay rates.** Norman, E.B. (Lawrence Berkeley Lab., CA (USA)). pp 28 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC03-76SF00098.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

In many astrophysical environments, physical conditions are so extreme that nuclear decay rates can be significantly altered from their laboratory values. At the high temperatures found in stellar interiors, nuclear excited states are populated and, in cases where the ground-state decay is highly forbidden, this can produce large increases in the nuclear decay rate. High-energy cosmic rays are fully stripped of their atomic electrons in passing through the interstellar medium. For the so-called electron-capture-only nuclei, this can result in dramatic decreases in the nuclear decay rate. Such effects are relevant to a number of current problems in nuclear astrophysics, including (1) the s-process neutron density inferred from the branch point at ^{148}Pm, (2) the nucleosynthesis of Nature's rarest isotope, ^{180}Ta, and (3) the cosmic-ray lifetimes of ^{54}Mn and ^{56}Ni. Laboratory experiments related to these problems are described.

38256 **Cosmological phase transitions.** Kolb, E.W. (Fermi National Accelerator Lab., Batavia, IL (USA)). pp 307-327 of Gravitation in astrophysics. Carter, B.; Hartle, J.B. (eds.). New York, NY; Plenum Publishing Corporation (1987). (CONF-8507172—).

From NATO advanced study institute on gravitational and astro physics; Cargese, France (15 Jul 1985).

If the universe stated from conditions of high temperature and density, there should have been a series of phase transitions associated with spontaneous symmetry breaking. The cosmological phase transitions could have observable consequences in the present Universe. Some of the consequences including the formation of topological defects and cosmological inflation are reviewed here. One of the most important tools in building particle physics models is the use of spontaneous symmetry breaking (SSB). The proposal that there are underlying symmetries of nature that are not manifest in the vacuum is a crucial link in the unification of forces. Of particular interest for cosmology is the expectation that are the high temperatures of the big bang symmetries broken today will be restored, and that there are phase transitions to the broken state. The possibility that topological defects will be produced in the transition is the subject of this section. The possibility that the Universe will undergo inflation in a phase transition will be the subject of the next section. Before discussing the creation of topological defects in the phase transition, some general aspects of high-temperature restoration of symmetry and the development of the phase transition will be reviewed. 29 references, 1 figure, 1 table.

38257 **Experimental determinations of reaction rates in the hot-CNO-cycle and the rp-process.** Parker, P.D. (Yale Univ., New Haven, CT (USA)). pp 32 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC02-76ER03074.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

In explosive nucleosynthetic events (e.g., the Hot-CNO-cycle and the rp-process), the temperatures and densities involved are sufficiently high so that proton and alpha-particle induced nuclear reactions can compete with beta decay. In order to study these reactions directly would require the use of short-lived radioactive targets or beams; however, it is possible to determine the relevant resonant reaction rates indirectly by making use of standard nuclear spectroscopy measurements together with stable nuclear targets and beams. Specific examples will be given in terms of recent measurements to determine the rates of the $^{13}N(p, \gamma)^{14}O$ and $^{15}O(\alpha, \gamma)^{19}Ne$ reactions.

38258 **Nuclear properties along the r-process path.** Aprahamian, A. (Lawrence Livermore National Lab., CA (USA)). pp 36-37 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

It has been pointed out that the description of r-process nucleosynthesis in a given astrophysical environment is strongly dependent on the input nuclear parameters. The nuclei produced are generally neutron-rich, far away from stability, and therefore not easily accessible by direct experimental observation. The required nuclear parametrization is often carried out by extrapolation from the known properties of nuclei near stability. The uncertainties introduced in this way have constituted some of the major limitations in the characterization of the r-process. Recently, however, it has been shown that totally different nuclear regions show a striking uniformity of behavior for certain observables as a function of the product of the number of valence protons and neutrons counted from the nearest closed shell. The main advantage of this approach is the conversion of the process of extrapolation of unknown nuclear properties to a far more reliable process of interpolation. The focus of this discussion will be the exploitation of this new approach to nuclear systematics to yield predictions for neutron-rich, rare-earth nuclei near the r-process abundance peaks at A=160 and 195.

38259 **Effects of recent improvements in mass formulae on the properties of neutron-rich heavy elements and implications for nuclear cosmochronology.** Howard, W.M.; Moeller, P.; Mathews, G.J.; Meyer, B.S. (Lawrence Livermore National Lab., CA (USA)). pp 37 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-48.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Recent improvements in mass formulae used to calculate masses, ground state deformations and fission barriers have a dramatic influence on the calculated properties of neutron-rich heavy elements. In particular, the recent development of a mass formula based on a Yukawa-plus-exponential macroscopic model and a folded Yukawa microscopic model gives an improved prediction of the masses of neutron-rich nuclei. The improvement seems to be due to the inclusion of additional physical effects in the macroscopic energy, such as the finite range of the nuclear force. Also, a new finite-range droplet model combines the droplet model with the folding surface and Coulomb-energy integrals from the finite-range model, as well as a new term which depends on bulk density variations. They explore the results of these models on properties of neutron-rich heavy elements relevant to the astrophysical r-process.

38260 **Parameter study of the r-process.** Sale, K.E.; Mathews, G.J. (Lawrence Livermore National Lab., CA (USA)). pp 37 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-48.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Observations of nearly pure r-process heavy element abundances in metal-poor halo stars suggest that the r-process occurs without pre-existing seed material, probably via the ejection of neutronized material from stellar cores or neutron star collisions. To better identify the possible site for such an r-process they have made a study of r-process nucleosynthesis as a function of the neutron mass fraction, total baryon density, and temperature describing the initial state of the r-process site. The calculations assume a rapid build-up of ^{56}Fe seed, adiabatic constant-velocity expansion, and include beta decay and fission energy release. A classical, dynamical r-process calculation follows the evolution of the composition until the neutrons are exhausted. They present the range of the parameters for which reasonable r-process yields can be obtained.

38261 **Shock ejection of hot neutron star matter as a site for the r-process.** Evans, C.R.; Mathews, G.J. (California Institute of Technology, Pasadena (USA)). pp 37 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The neutron stars in the binary pulsar PSR 1913 + 16 will coalesce in 3.5 x 10^8 years due to gravitational radiation reaction. During mergers of this type, a significant amount of material may be ejected from the system. Ejection is produced by shock acceleration and shock heating, followed by expansion acceleration of the heated material. A recent full two-dimensional treatment of a head on collision of such stars indicated a succession of shock waves produce a phase of steady mass ejection, during which as much as 5 to 10% of the material is expelled. In the more likely case of circular orbit decay, orbital motion will initial shocks in the common envelope which forms after tidal overflow. This highly neutronized material provides a favorable site for r-process during the subsequent decompression. This blow-off mechanism implies two main differences from previous work on the expansion and nucleosynthesis. The ejected material is initially hot, having been heated above 10^{10}K in the shocks and the escaping material comes to a terminal velocity, implying a high expansion rate. If the r-process is efficient during decompression, then a binary neutron star merger rate as low as 10^{-5} yr^{-1} can account for a significant fraction of galactic heavy element synthesis.

6402 Atmospheric Physics

38262 **(AD-A—190174/3/XAB) Support for FY87 midlatitude electron-density calibration campaign. Scientific Report No. 5, 4 June-15 October 1987.** Lansinger, J.M. (Northwest Research Associates, Inc., Bellevue, WA (USA)). 15 Oct 1987. 14p. (NWRA-CR—87-R018). NTIS, PC A03/MF A01.

One of the applications of data from AFGL's Auroral and Ionospheric Remote sensor (AIRS) aboard the Polar BEAR Satellite is an attempt to produce electron-density profiles from remote passive topside sensing. Development of this procedure required real-time acquisition of AIRS data simultaneously and closely colocated with data from the Millstone Hill incoherent-scatter radar. The field procedure to accomplish this objective involved utilization of the DNA Rover ground station deployed in the vicinity of Westford, MA to receive AIRS and other support data from P.BEAR while the satellite overflew the radar. The radar provided ground-truth information on ionospheric electron-density profiles and measurements of electron and ion temperature, plasma drift, and the thermospheric neutral wind during selected satellite passes between 1 July and 11 August, 1987. This report describes the field operations in support of the stated objective and some observations related to attitude determination for the Polar BEAR Satellite.

38263 **(AD-A—190466/3/XAB) Satellite uv image processing. Scientific report No. 4, 1 July-10 September 1987.** Rosenberg, N. (Northwest Research Associates, Inc., Bellevue, WA (USA)). 9 Oct 1987. 56p. (NWRA-CR—87-R016). NTIS, PC A04/MF A01.

The overall objective of the computer program is the photometric and geometric processing of UV satellite images. The data source is the AIRS scanning UV spectrometer aboard the POLAR BEAR satellite. The processing is designed to provide geographic-mapped images that describe the spatial and temporal variability of airglow and aurora of emitting species. The AIRS data stream provided simultaneous records from 3 detectors received at several ground stations from several passes per day. These total about 1500 useful images from launch to Feb. 1987. The major progress during the report period was development of programs to accomplish the following: 1) Statistical filtering of low-count images to provide meaningful brightness estimates; 2) Use of observed limb locations

to provide attitude correction in daylit images and attitude estimation in night images to provide accurate ground positions; 3) Normalization of airglow based on column path length and solar flux which allows separation of aurora from airglow portions of the images; 4) Multi-band presentation of auroral features that clearly define differences between the location of emitting species.

38264 **(AD-A—190469/7/XAB) Sudden ionospheric disturbance model uncertainty assessment. Final report, October 1984-September 1986.** Roy, T.N.; Sailors, D.B. (Naval Ocean Systems Center, San Diego, CA (USA)). Jul 1986. 35p. (NOSC/TR—1140). NTIS, PC A03/MF A01.

The impact of a sudden ionospheric disturbance (SID) on HF propagation is discussed. The development of an empirically derived relationship (SIDGRID) to model this impact is presented. The SIDGRID model compared to 198 observed sounder data points. For distances less than 1500 km, the short-range prediction error was 0.5 MHz and in 95% of the tests the long-range prediction error was less than or equal to 2.0 MHz. Current FORTRAN and BASIC implementations of the model are given in Appendices C and D.

38265 **(AD-A—190548/8/XAB) Instantaneous pictures of the high-latitude electrodynamics using Viking and DMSP/F7 observations.** Marklund, G.T.; Blomberg, L.G.; Hardy, D.A.; Rich, F.J. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). Aug 1987. 7p. (AFGL-TR—87-0339). NTIS, PC A02/MF A01.

Pub. in Proceeding of the ESA Symposium on European Rocket and Balloon Programmes and Related Research (8th), 45-50(Aug 1987).

Simultaneous observations by the Viking and the DMSP/F7 satellites were applied to a new technique to obtain realistic pictures of the auroral electrodynamics. In particular, an instantaneous global equipotential pattern is calculated using field-aligned current and conductivity distributions that are qualitatively consistent with the Viking auroral imager data and quantitatively consistent with magnetic-field and particle data from the two satellites. This convection pattern agrees with the E x B-drift vectors estimated from Viking electric-field data. Discrepancies consistent with upward parallel electric fields occur in regions of upward currents. The pattern is of the normal two-cell type, with a small dusk cell and a large, elongated crescent-shaped dawn cell. The excellent agreement between the satellite and model data demonstrates the reliability of the results.

38266 **(PB—88-187877/XAB) STP (Solar-Terrestrial Physics) Newsletter 87-1.** (International Council of Scientific Unions, Urbana, IL (USA). Scientific Committee on Solar-Terrestrial Physics). 1987. 21p. NTIS, PC A03/MF A01.

Contents include: SCOSTEP organization; draft minutes of SCOSTEP Bureau meeting, August 20-21, 1987; solar-terrestrial energy program (STEP), preliminary report; USSR participation in STEP; STEP Steering Committee meeting, August 1987; CEDAR Steering Committee report; future meetings; and SCOSTEP adherents, secretaries and correspondents.

38267 **(AD-A—190545/4/XAB) Parametric study on the quenching of critical velocity ionization.** Lai, S.; McNeil, W.; Murad, E. (Air Force Geophysics Lab., Hanscom AFB, MA (USA)). 23 Sep 1987. 5p. (AFGL-TR—87-0335). NTIS, PC A02/MF A01.

Pub. in Conference on the Numerical Simulation of Plasmas (12th), 1-4(23 Sep 1987).

Numerical results on the quenching of critical ionization velocity (CIV) process due to pre-dissociation and dissociative electron-ion recombination are presented.

38268 **(CEA-CONF—9290) Reactive collision with excited states in a crossed beam experiment: $O(^1D) + H_2(v) \rightarrow OH(A\ ^2\Sigma^+) + H$.** Lebehot, A.; Marx, J.; Aguillon, F.; Drawin, S.; Campargue, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Physico-Chimie). 1987. 4p. (CONF-870752—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753470/JAW.

From 11. international symposium on molecular beams; Edinburgh, UK (12 Jul 1987).

The $O(^1D)$ atomic beam is obtained from a radio frequency discharge nozzle jet source. The vibrational excitation, in the H_2 molecular beam, is produced by low energy electron bombardment. The reaction is observed through the spontaneous fluorescence of the product $OH(A^2\Sigma^+)$. The measured spectrum corresponding to the (0-0) $A\ ^2\Sigma^+ \rightarrow X^2\pi$ transitions is consistent with a simulated statistical rotational distribution of $OH(A^2\Sigma^+)$, i.e. the "prior" distribution of the information-theoretic approach. A strongly non-statistical effect on the spin distribution is observed: the $OH(A^2\Sigma^+)$ appears to be produced with only 13 of molecules in the -12 spin state.

38269 **(CONF-880435—8) Two-photon (VUV + visible) resonance ionization spectroscopy of molecular hydrogen.** McCann, M.P.; Chen, C.H.; Payne, M.G. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008365/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

Two-photon transitions have been examined in molecular hydrogen using coherent vacuum ultraviolet (VUV) photons at a fixed wavelength of 118 nm and a tunable photon from a dye laser. Though the VUV intensity is very weak ({approximately}100 nJ per pulse) it was utilized very efficiently since most VUV photons in the ionoization region were absorbed. This is the first time that coherent VUV light has been employed with tunable visible light for the production of two-photon spectra and the measurement of two-photon rates. A new parameter is proposed for direct comparison of the data from various two-photon experiments. 4 refs., 2 figs., 1 tab.

38270 **(CONF-880435—17) Suppression of multiphoton excitation in resonance ionization measurements.** Garrett, W.R.; Moore, M.A.; Wunderlich, R.K.; Payne, M.G. (Oak Ridge National Lab., TN (USA)). Apr 1988. Contract AC05-84OR21400. 4p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009702/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

We describe experimental confirmation of strong suppressions of laser-driven nonlinear absorption processes by electromagnetic fields through other nonlinear processes within a given atomic or molecular medium. (AR)

38271 **(CONF-880706—1) Quantitative measurements of two-photon process of gases, liquids, and solids.** Chen, C.H.; McCann, M.P.; Payne, M.G. (Oak Ridge National Lab., TN (USA)). Jan 1988. Contract AC05-84OR21400. 6p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88003094/JAW.

From International quantum electronics conference; Tokyo, Japan (18 Jul 1988).

Absolute two-photon absorption cross sections for various rare gas atoms and small molecules were measured by resonance ionization spectroscopy. Two-photon cross sections of various liquids and solids were obtained by the two-photon induced fluorescence method.

38272 (CONF-8610115—28) Comments on H^- volume production in Cs-seeded ion sources. Appendix I. Peterson, J.R. (Brookhaven National Lab., Upton, NY (USA)). 1986. Contract AT03-80ER53091. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012119/JAW.

From 4. international symposium on the production and neutralization of negative ions and beams; Upton, NY, USA (27 Oct 1986).

Considerable interest was generated at the IAEA Negative Ion Beam Workshop in Grenoble, France, in March, 1985, by a report from the Kurchatov Institute on the development of a 2-ampere steady-state H^- ion source, in which the ions were volume-produced in a discharge in H_2, seeded with Cs vapor. The mechanism primarily responsible for this remarkably high current from a volume production source was not yet understood, but it was tentatively presumed to involve the collisional energy transfer from electronically excited Cs 6p atoms into H_2 vibrations. In any case, it was apparently different from the surface-plasma interactions that have been assumed to control the H^- production in the Dudnikov-Dimov type sources.

38273 (CONF-8707160—1) Alignment and orientation in ion{endash}atom collisions. Kimura, M.; Lane, N.F. (Argonne National Lab., IL (USA); Rice Univ., Houston, TX (USA)). 1987. Contract W-31109-ENG-38. 31p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010015/JAW.

From International symposium on polarization and correlation in electronic and atomic collisions; Belfast, Ireland (20 Jul 1987).

Recent progress in the theoretical study of alignment and orientation in atom-atom and ion-atom collisions at intermediate energies is reviewed. Recent systematic studies of the alignment and orientation of electronic charge cloud distributions of excited states resulting from such collisions clearly have provided more detailed information about the underlying collision dynamics. However, since accurate determination of these parameters is quite difficult, both theoretically and experimentally, a close collaboration between theory and experiment is necessary for a deeper understanding of the collision dynamics. A more complete approach, where the full density matrix is determined, is also discussed.

38274 (DOE/ER—13700-1) Determination of stepsize parameters for intermolecular vibrational energy transfer: Progress report, May 1, 1987-April 30, 1988. Tardy, D.C. (Iowa Univ., Iowa City (USA)). May 1988. Contract FG02-87ER13700. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010904/JAW.

Intermolecular vibrational energy transfer for highly excited polyatomic molecules is involved in any mechanism in which excitation energy is required (pyrolysis) or in which energy must be removed from a hot source (cooling). The average energy removed per collision, <{DELTA}E>, is a useful quantity to compare efficiency for energy transfer. The objectives of this work are: to determine the dependence of <{DELTA}E> on excitation energy and on the molecular complexity (number of vibrational modes) of substrate and deactivator; to assess the importance of intermolecular attractions (complex formation) on vibrational energy transfer; to obtain detailed information on the energy distribution after collision and to evaluate the importance of <{DELTA}E> on high-temperature unimolecular reactions. This information will be obtained by monitoring the time dependence of the infrared emission, ultraviolet absorption, refractive index and pressure. The results from these complementary techniques will be benchmarked with <{DELTA}E> values from previous studies on the relaxation of chemically activated alkyl and fluoroalkyl radicals. Trajectory calculations simulating energy transfer are being performed for "generic" substrate/deactivator pairs to provide additional details and insight on the important parameters. Model calculations are also being performed to determine the feasibility of obtaining <{DELTA}E> information from experimental data for high-temperature unimolecular reactions.

38275 (DOE/ER/02887—1) Theoretical studies of highly ionized species: Final report for the period 1 March 1976 through 29 February 1988. Dalgarno, A. (Harvard Univ., Cambridge, MA (USA)). May 1988. Contract AC02-76ER02887. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011118/JAW.

Theoretical studies were carried out of atomic and molecular phenomena with an emphasis on the properties of highly-ionized systems. Methods were developed for the inclusion of correlation and relativistic effects in the determination of spectral line oscillator strengths and transition probabilities. The process of charge transfer by low energy multiply-charged ions colliding with atomic hydrogen was investigated and cross sections were obtained for many systems. It was pointed out that the favored channels often lead to excited ions which reveal their presence by specific emission lines. A multichannel theory of photodissociation was constructed that incorporates final state interactions. The properties of multiply-ionized molecules were explored and stable systems were identified. Work was carried out on intense field effects, the Berry phase in atomic physics and on processes of chemi-ionization. Plasma density effects on proton-impact excitations of fine-structure levels of hydrogenic ions were calculateed using a static potential model.

38276 (DOE/ER/13778—1) Correlated charge changing ion-atom collisions: Progress report for the period February 15, 1987-March 14, 1988. Bernstein, E.M.; Tanis, J.A. (Western Michigan Univ., Kalamazoo (USA)). Apr 1988. Contract FG02-87ER13778. 11p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009215/JAW.

This report summarizes the progress and accomplishments in accelerator atomic physics research supported by DOE grant DE-FG02-87ER13778 for a period of 13 months from February 15, 1987 through March 14, 1988. The general scope of this work involves the experimental investigation of fundamental atomic interactions in collisions of highly charged projectiles with neutral targets, with a particular emphasis on two-electron interactions. Inner-shell processes involving excitation, ionization, and charge transfer are investigated using coincidence techniques in which projectile charge-changing events are associated with x-ray emission, target recoil ions, or electron emission. New measurements were conducted using accelerators at the Lawrence Berkeley Laboratory, Argonne National Laboratory, Hahn-Meitner-Institut (Berlin), and Western Michigan University. The work at Hahn-Meitner resulted from a collaboration initiated while J. A. T. was on research leave from Western Michigan University during the 1986-1987 academic year. The principal new results obtained during the past year using each of the three coincidence techniques are summarized below. A major emphasis of all these investigations is to determine the role of electron correlation in two- (and multiple-) electron interactions.

38277 (DOE/ER/70068—T4) The kinetics of reactions of cyano compounds at high temperatures: Final report, February 1, 1985-January 31, 1988. Hanson, R.K.; Bowman, C.T. (Stanford Univ., CA (USA). High Temperature Gasdynamics Lab.). 1988. Contract AT03-76ER70068. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007997/JAW.

This report summarizes progress and accomplishments on a program to investigate the reaction kinetics of cyano compounds at high temperatures. During this program, research has proceeded in several areas, including: development of an atomic resonance absorption system (ARAS) for measuring H-atoms in shock tube kinetics experiments; measurement of the high-temperature rate coefficients of several reactions of cyano compounds in a shock tube using several different optical techniques, including ARAS and tunable laser absorption; and initial application of excimer laser photolysis for generation of the NCO radical for shock tube kinetics experiments. 10 refs., 3 figs.

38278 (GSI—87-11, pp A3.1-A3.3) Physical properties of heavy ion interactions with atoms and molecules. Toburen, L.H. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753546/JAW. (CONF-870779—). Contract AC06-76RL01830.

From 3. workshop on heavy charged particles in biology and medicine; Darmstadt, F.R. Germany (13 Jul 1987).

38279 **(IC—87/57) Inner-shell excitation of alkali-metal atoms.** Tiwary, S.N. (International Centre for Theoretical Physics, Trieste (Italy)). Jun 1987. 12p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702041/JAW.

Inner-shell excitation of alkali-metal atoms, which leads to auto-ionization, is reviewed. The validity of quantum mechanical approximation is analyzed and the importance of exchange and correlation is demonstrated. Basic difficulties in making accurate calculations for inner-shell excitation process are discussed. Suggestions are made for further study of inner-shell process in atoms and ions. (author). 26 refs, 4 figs, 1 tab.

38280 (INIS-BR—1075, pp 10) **Location of electrons on liquid helium films.** Marques, G.E.; Studart, N. 1985. (In Portuguese). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702773/JAW. (CONF-8512148—).

From 3. workshop on statistical mechanics and field theory; Sao Carlos, Brazil (11 Dec 1985).

38284 (INIS-mf—11219, pp 185-203) **Altered Thomas-Fermi model of the atom.** Brink, J.H.; Kok, F.J. (Pretoria Univ. (South Africa)). 1987. (In Afrikaans). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

The Thomas-Fermi theories are altered to calculate the ionization energies of atoms. At the same time we find that other atomic parameters such as average radius and binding energy, have improved quantitatively in respect to traditional theories.

38285 (INIS-SU—5/A, pp 24-28) **More accurate calculation of the energy levels of weakly bound rotation-vibrational states of mesic molecules ddμ and dtμ.** Vinitskij, S.I.; Korobov, V.I.; Puzynin, I.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1987. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88780078/JAW. (JINR-N—3(23)-87).

In JINR rapid communications. Collection.

More accurate variational calculations are performed for energy levels is an element of$_{11}$ of weakly bound rotation-vibrational states (J=1 and V=1) of mesic molecules ddμ and dtμ. To this end, use has been made of a great number (up to 2000) of basis functions, a better distribution of powers of independent variables, more accurate values of nonlinear parameters, and of a more accurate value of the muon mass. The results of extrapolation are as follows: -is an element of$_{11}$(ddμ)=(1.9750+-0.0002) eV, -is an element of$_{11}$(dtμ)=(0.6604+-0.0002) eV. 4 refs.; 1 fig.; 3 tabs.

38286 **(JINR-E—17-87-194) Collective jumps in a system of three-level atoms.** Shumovskij, A.S.; Tanas, R.; Tran Quang. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702918/JAW.

Submitted to the journal Optics Comm. .

The collective jumps in the steady-state intensity of resonance fluorescence and the collective population trapping in a system of three-level atoms interacting with intense external field are considered. It is shown that for a proper choice of parameters the atomic populations and the steady-state intensity of resonance fluorescence from such a system display discontinuous behaviour (jumps) in a collective limit N -> ∞. Potential applications of collective jumps to measure weak transition linewidths are shortly discussed. 19 refs.; 3 figs.

38287 **(JINR-E—17-87-436) Collective resonance fluorescence in an intense laser field with phase and amplitude fluctuations.** Shumovskij, A.S.; Tanas, R.; Tran Quang. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 19p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702920/JAW.

Submitted to the journal J. Phys. .

The collective resonance fluorescence from a systen of two-level atoms resonantly driven by a strong laser field with the phase and amplitude fluctuations is considered. The effect of the field fluctuations on the spectrum as well as on the degrees of the second-order coherence of the fluorescent field is discussed in detail for the off-resonance case. 29 refs.; 5 figs.

38288 **(JINR-R—4-87-706) Energy levels of mesic molecules.** Vinitskij, S.I.; Puzynin, I.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1987. 16p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702933/JAW.

Submitted to the journal J. Muon Catalysed Fusion.

A review is given for the methods and results of calculations of energy levels and wave functions of mesic molecules of hydrogen isotopes. The review includes the results since 1977 when characteristics of a weakly bound state (J=V=1) of mesic molecule dtμ were determined and reliably calculated, thus inspiring a renewed interest in the muon catalysis. Particular attention has been given to the construction of methods and high-precision calculations performed at the JINR. 33 refs.; 5 tabs.

38289 **(LA—11288-MS) Total and differential electron collision cross sections for O_2 and N_2.** Murphy, T. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 39p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010485/JAW.

We present a compilation of total and differential cross sections for electron scattering of N_2 and O_2. Energy-dependent total cross sections and energy- and angle-dependent differential cross sections are given for elastic, rotational, vibrational, electronic excitation, and ionizing collisions. 16 refs., 46 figs., 8 tabs.

38290 **(LA-UR—88-1446) Sources of polarized ions and atoms.** Cornelius, W.D. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 22p. (CONF-880614—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010910/JAW.

From 7. international conference on ion implantation technology; Kyoto, Japan (7 Jun 1988).

In this presentation we discuss methods of producing large quantities of polarized atoms and ions (Stern-Gerlach separation, optical pumping, and spin-exchange) as well as experimental methods of measuring the degree of polarization of atomic systems. The usefulness of polarized atoms in probing the microscopic magnetic surface properties of materials will also be discussed. 39 refs., 5 figs., 2 tabs.

38291 (LA-UR—88-1671) Raman spectroscopy on simple molecular systems at very high density. Schiferl, D.; LeSar, R.S.; Moore, D.S. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 27p. (CONF-880372—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010947/JAW.

From NATO advanced study institute on simple molecular systems at very high densities; Les Houches, France (29 Mar 1988).

We present an overview of how Raman spectroscopy is done on simple molecular substances at high pressures. Raman spectroscopy is one of the most powerful tools for studying these substances. It is often the quickest means to explore changes in crystal and molecular structures, changes in bond strength, and the formation of new chemical species. Raman measurements have been made at pressures up to 200 GPa (2 Mbar). Even more astonishing is the range of temperatures (4-5200{degree}K) achieved in various static and dynamic (shock-wave) pressure experiments. One point we particularly wish to emphasize is the need for a good theoretical understanding to properly interpret and use experimental results. This is particularly true at ultra-high pressures, where strong crystal field effects can be misinterpreted as incipient insulator-metal transitions. We have tried to point out apparatus, techniques, and results that we feel are particularly noteworthy. We have also included some of the {open<-quotes}oral tradition{close<-quotes} of high pressure Raman spectroscopy -- useful little things that rarely or never appear in print. Because this field is rapidly expanding, we discuss a number of exciting new techniques that have been informally communicated to us, especially those that seem to open new possibilities. 58 refs., 18 figs.

38292 (LBL—24068) Measurements of vacuum arc ion charge state distributions. Brown, I.G.; Galvin, J.E. (Lawrence Berkeley Lab., CA (USA)). Feb 1988. Contract AC03-76SF00098. 9p. (CONF-880687—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008249/JAW.

From 13. international symposium on discharges and electrical insulation in vacuum; Paris, France (27 Jun 1988).

We have measured the charge state distribution of ions generated in the metal vapor vacuum arc under a wide range of experimental conditions. The experiments were carried out using an ion source in which the metal vapor vacuum arc is used as the method of plasma production and by which a high quality, high current beam of metal ions is produced. Charge state spectra were measured using a time-of-flight diagnostic; arc voltages were also measured. Parameters varied include: cathode material, arc current, axial magnetic field strength, neutral gas pressure, and arc geometry. 9 refs., 4 figs.

38293 (PUB—643) ALS handbook - a summary of the capabilities and characteristics of the advanced light source. (Lawrence Berkeley Lab., CA (USA)). Jun 1988. Contract AC03-76SF00098. 60p. NTIS, PC A04/MF A01; 1; GPO Dep. Order Number DE88011909/JAW.

This booklet aims to provide the prospective user of the Advanced Light Source with a concise description of the radiation a researcher might expect at his or her experimental station. The focus is therefore on the characteristics of the light that emerges from insertion devices and bending magnets and on how components of the beam lines further alter the properties of the radiation. The specifications and operating parameters of the ALS injection system and storage ring are of only peripheral interest. To this end, Sections 3 and 5 and most of Section 4 are devoted to summary presentations, by means of performance plots and tabular compilations, of radiation characteristics at the ALS - spectral brightness, flux, coherent power, resolution, time structure, etc. - assuming a representative set of four undulators and one wiggler and a corresponding set of five beam lines. As a complement to these performance summaries, Section 1 is a general introductory discussion of synchrotron radiation and the ALS, and Section 2 provides a compendious introduction to the characteristics of synchrotron radiation from bending magnets, wigglers, and undulators. In addition, Section 4 briefly introduces the theory of diffraction grating and crystal monochromators.

38294 (UCID—21077) Steady-state approximations in Raman excitation equations. Shore, B.W. (Lawrence Livermore National Lab., CA (USA)). 20 Dec 1987. Contract W-7405-ENG-48. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011759/JAW.

This memo presents equations describing propagation of beams of nearly monochromatic radiation through a Raman-active molecular vapor, under conditions of steady excitation of quantum-mechanical molecules by classical radiation (that is, by radiation that comprises a large number of photons per mode). Such conditions apply in the continuous-wave experiments that are conducted to measure such properties as Raman gain or Raman scattering cross sections. Under those circumstances the propagation is described by rate equations for molecular excitation and rate equations for photon numbers. Although these conditions do not apply for short-pulse transient excitation, both types of processes are parameterized by the same molecular polarizability matrix elements. This memo discusses those parameters, as extracted from steady state observations.

38295 Optical luminescence excitation spectra of molecular oxygen in the soft x-ray region. Yang, B.X.; Hanson, D.M.; Tohji, K. (State University of New York, Stony Brook, New York 11794). *Journal of Chemical Physics;* **89**: No. 3, 1215-1218(1 Aug 1988).

The observation of an anomaly in the optical luminescence excitation spectrum of oxygen in the region of the oxygen K edge is reported. Dispersed luminescence spectra were obtained for x-ray excitation at the pi and sigma resonances, at the anomaly, and in the continuum. These spectra indicate enhanced production of O/ sup 2+/$_2$ ions at both the sigma resonance and at the anomaly. The anomaly thus is attributed to a shake-up or shake-off state associated with an antibonding sigma molecular orbital of oxygen. This work also demonstrates that optical luminescence spectra provide state-specific information about the products of core hole excitation and relaxation.

38296 Absorption spectrum of the PuF_6 photodissociation product in the visible wavelength region. Kim, K.C.; Campbell, G.M. (Materials Science and Technology Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Journal of Chemical Physics;* **89**: No. 3, 1443-1444(1 Aug 1988).

We report the first spectroscopic observation of the transient photodissociation product following the 248 nm (KrF excimer laser) photolysis of PuF_6 and present its low resolution absorption spectrum in the visible. Although this photoproduct was postulated as the primary reaction intermediate for some time, up to now it has not been detected in the gas phase because of its extreme reactivity and instability.

38297 Crossed-beam reactive scattering of F_2 plus C_6H_6: Heat of formation of ipso-fluorocyclohexadienyl radical. Grover, J.R.; Wen, Y.; Lee, Y.T.; Shobatake, K. (Institute for Molecular Science, Myodaiji, Okazaki 444, Japan). *Journal of Chemical Physics;* **89**: No. 2, 938-946(15 Jul 1988).

Angular distributions and relative total cross sections were measured for products of the collisions of F_2 with C_6H_6 at relative collision energies of 14 to 26 kcal mol^{-1}. The most conspicuous product is the ipso-fluorocyclohexadienyl radical i-C_6H_6 Fts-dot, which displays a rather narrow peak very near the center-of-mass angle at all collision energies studied. Product C_6H_5F is masked at Me = 96 by dissociative ionization of C_6H_6 Fts-dot near the center-of-mass angle, but becomes observable at smaller angles to which little or no C_6H_6 Fts-dot is scattered. This means that at least one reaction $C_6H_6 + F_2 \rightarrow C_6H_5F + HF$ occurs, and does so in such a way that the products acquire high translational energies. The dependence on collision energy of the total cross section for the production of C_6H_6 Fts-dot was probably measured, and displays a well-marked onset at 13.9 +- 0.3 kcal mol^{-1}. The center-of-mass system means final state translational energy as a function of collision energy was obtained from the angular distributions and goes to zero at 13.9 +- 0.5 kcal mol^{-1}. This probably means that the onset is a true threshold, from which the heat of formation of the ipso-fluorocyclohexadienyl radical is calculated to be 14.8 +-

0.4 kcal mol^{-1}. The mean final state translational energy asymptotically approaches 3.7 kcal mol^{-1} as the collision energies are increased, which is so large that only a fraction of the vibrational modes of C_6H_6 Fts-dot can be involved in the energy partitioning.

38298 **Jellium-model calculation for dimer decays of potassium clusters.** Saito, S.; Cohen, M.L. (Department of Physics, University of California, Berkeley, California 94720). *Physical Review [Section] B: Condensed Matter;* **38**: No. 2, 1123-1130(15 Jul 1988).

We have calculated the total energies of n-atom potassium clusters K/sub n/ ($1 \leq n \leq 23$) using a jellium-sphere background model for the positive-ion cores and the local-spin-density-functional approximation for the valence electrons. We find that the K clusters which have exoergic fission channels have low abundances in the experimental mass spectra indicating the presence of thermal fissions of K/sub n/. Most of the exoergic fissions are found to produce dimers, K_2, as one of the daughter clusters. We have studied the "dimer decay" of K/sub 10/ in an attempt to explain why K/sub 10/ is one of the least abundant clusters in the K/sub n/ mass spectra. Two overlapping jellium spheres with constant density are used for the positive background. The energy-barrier height for complete decay from the energy-minimum point is found to be 0.18 eV, which is a reasonable magnitude for thermal decay compared to the experimental temperature. The monomer decay of K_6 and the dimer decay of K_8 are found to have higher barriers.

38299 **Si 2p and 2s resonant excitation and photoionization in SiF_4.** Ferrett, T.A.; Piancastelli, M.N.; Lindle, D.W.; Heimann, P.A.; Shirley, D.A. (Department of Chemistry, University of California, Berkeley, California 94720). *Physical Review [Section] A: General Physics;* **38**: No. 2, 701-710(15 Jul 1988).

We present partial-cross-section results for Si 2p and valence photoionization of SiF_4 for photon energies in the vicinity of the Si 2p and 2s thresholds. The continuum shape resonances decay only to the Si 2p main line, in accordance with one-electron theory predictions. The Si L/sub 2,3/VV Auger spectrum was also measured, and was found to agree with earlier work. We propose that variations in hole-interaction energies are important in assigning the Auger final states. For the Si 2p discrete excitations, spectra obtained on the σ/sup */(a_1) resonances compare well with previous qualitative results and the above-threshold Si L/sub 2,3/VV Auger spectrum. Our results help to quantify the relative enhancement of satellites and main lines, emphasizing the dominance of spectator decay. Spectra obtained at several higher-energy Si 2p and Si 2s excitations also generally support spectator decay as an important mode of relaxation for these discrete states. The overall assignment of the Si 2p and 2s discrete excitations to molecular-orbital and Rydberg transitions is discussed.

38300 **Time-dependent theory of multiphoton ionization of xenon.** Kulander, K.C. (Theoretical Atomic and Molecular Physics Group, Lawrence Livermore National Laboratory, P.O. Box 808, Livermore, California 94550). *Physical Review [Section] A: General Physics;* **38**: No. 2, 778-787(15 Jul 1988).

Calculations of the single and multiphoton ionization of xenon valence-shell electrons are reported for several wavelengths and laser intensities. The model follows a single valence electron in the field of an effective core potential, the remaining valence electrons, frozen in their ground-state orbitals, and a linearly polarized laser field. Ionization rates and cross sections are determined using a direct numerical solution of the time-dependent Schroedinger equation using a finite-difference technique. Excellent agreement with experimental rates and previous theoretical cross sections has been obtained. Bound states, shifted into resonance by the ac Stark effect, are found to affect the ionization dynamics. Departures from perturbation theory at high intensities are demonstrated and discussed.

38301 **Resonances in electron-impact single, double, and triple ionization of heavy metal ions.** Mueller, A.; Tinschert, K.; Hofmann, G.; Salzborn, E.; Dunn, G.H. (Institut fuer Kernphysik, Universitaet Giessen, D-6300, Giessen, Federal Republic of Germany). *Physical Review Letters;* **61**: No. 1, 70-73(4 Jul 1988).

We report narrow dielectronic capture resonances decaying by double autoionization observed for the first time in electron-impact ionization of ions. We also observe corresponding peaks in double and triple ionization leading us to postulate new processes where dielectronic capture is followed by triple or quadruple autoionization, respectively.

38302 **Vibrational branching ratios following two-color excitation of autoionizing np Rydberg states of H_2.** O'Halloran, M.A.; Dehmer, P.M.; Tomkins, F.S.; Pratt, S.T.; Dehmer, J.L. (Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Chemical Physics;* **89**: No. 1, 75-84(1 Jul 1988).

Two-color resonantly enhanced multiphoton ionization-photoelectron spectroscopy (REMPI-PES) was used to determine vibrational branching ratios following autoionization of the ungerade $np\sigma\ ^1\Sigma^+$/sub u/ and $np\pi\ ^1\Pi$/sub u/ Rydberg states of H_2. In this two-step experiment, one laser used to excite the two photon transition to the $E,F\ ^1\Sigma^+$/sub g/, $v' = E2$, $J' = 1$ state, and a second laser was used to access the autoionizing Rydberg states near the $H^+{}_2X\ ^2\Sigma^+$/sub g/, $v^+ = 2$ ionization limit. Electrons corresponding to the formation of $H^+{}_2X\ ^2\Sigma^+$/sub g/, $v^+ = 0$ and 1 were collected and energy analyzed using a magnetic bottle electron spectrometer. In agreement with the well-known propensity rule for vibrational autoionization, the vibrational branching ratios strongly favor the final ionic state that corresponds to the minimum change in vibrational quantum number. In general, the branching ratio into the $v^+ = 1$ channel is 94%—96%, while that into the $v^+ = 0$ channel is 4%—6%; however, two major deviations from this trend were observed for Rydberg states that are perturbed by the $3p\pi\ ^1\Pi$/sub u/, $v = 9$ and $4p\sigma\ ^1\Sigma^+$/sub u/, $v = 7$ states.

38303 **Quasiclassical trajectory study of rotational energy transfer in the scattering of NH_3 from a flat, rigid gold surface.** Coltrin, M.E.; Kay, B.D. (Sandia National Laboratories, Albuquerque, New Mexico 87185). *Journal of Chemical Physics;* **89**: No. 1, 551-561(1 Jul 1988).

Quasiclassical trajectories are used to study rotational energy transfer in the collision of a rigid-rotor NH_3 molecule with a flat, rigid gold surface. The anisotropic term in the long-range attractive potential causes the NH_3 to preferentially reorient with its dipole moment normal to the surface plane as it approaches the surface. This reorientation decreases the rotational energy transfer and gives rise to a sharp rotational rainbow at zero rotational energy. Trajectory results predict that the molecule preferentially scatters into low K states (tumbling) rather than the $J = K$ states (spinning). This prediction is in qualitative agreement with recent molecular beam/surface scattering experiments.

38304 **Multiconfiguration Hartree-Fock calculation of the photoionization of the excited Na 4d state.** Saha, H.P.; Pindzola, M.S.; Compton, R.N. (Department of Physics, University of Central Florida, Orlando, Florida 32816-0993). *Physical Review [Section] A: General Physics;* **38**: No. 1, 128-134(1 Jul 1988).

The photoionization cross section for the excited Na 4d state has been calculated with the multiconfiguration Hartree-Fock method. Ab initio methods are used to take into account the core-polarization effects. The minimum (zero) in the 4d→kp cross section has been calculated and it is found that including the effects of core-polarization shifts the position of the minimum (zero) to a higher energy. The calculation of the photoionization angular distribution asymmetry parameter is an excellent test to locate the minimum (zero) in the cross section. The present results are in good agreement with the experimental results of Smith et al. [Phys. Rev. A 22, 577 (1980)] performed at a single photon energy.

38305 **Photodetachment cross section of Cu^-.** Scheibner, K.F.; Hazi, A.U. (High Temperature Physics Division, Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physical Review [Section] A: General Physics;* **38**: No. 1, 539-542(1 Jul 1988).

We report the first ab initio calculation of the photodetachment cross section of the bound Cu^- ion. The calculated cross section exhibits two shape resonances, the larger of which should be

accessible experimentally. The magnitude of the cross section is substantial [(6.8—7.1) x 10/sup -17/ cm²] at wavelengths associated with the copper-vapor laser.

38306 Stark mixing of 2S muonic helium. I. Collisions with hydrogen atoms. Struensee, M.C.; Cohen, J.S. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] A: General Physics;* **38**: No. 1, 44-52(1 Jul 1988).

The transitions between the 2S and 2P states of the muonic helium atom ($\alpha\mu$ or ^{3}He-μ) in collisions with hydrogen atoms are examined using the rectilinear-trajectory coupled-equation method. The 2S level shift is included semiempirically and the target atom is approximated using the frozen ground-state charge density. Partial decoupling of the coupled equations is achieved, and some simple approximations for the 2S-to-2P transition probability are derived and compared with the exact solution of the coupled equations. The cross section obtained is fit by $\sigma_{1/2}$/sub S//sub -/$_{3/2}$/sub P/≅5.5 x 10/sup -3// v/sup 1.8/a_0^2 for vapprox. >1, with the velocity v in atomic units, and muon-catalyzed fusion parameters are reevaluated using this expression.

38307 Stark mixing of 2S muonic helium. II. Molecular and multiple-scattering effects in hydrogen. Cohen, J.S.; Struensee, M.C. (Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] A: General Physics;* **38**: No. 1, 53-57(1 Jul 1988).

The rectilinear-trajectory coupled-equation method is extended in this paper to collisions of $\alpha\mu$(2S) with molecular D_2. An efficient quadrature is formulated to integrate over the reaction probabilities and obtain the cross section that is dominated by trajectories passing close to one or the other nucleus. Molecular effects are found to increase the cross section by only 1—2 % above twice the atomic value. Coherent effects in multiple scattering by more than one molecule in a high-density (or condensed) medium are also examined and shown to be negligible.

38308 Cross sections for electron-impact single ionization of Kr/sup 8+/ and Xe/sup 8+/. Bannister, M.E.; Mueller, D.W.; Wang, L.J.; Pindzola, M.S.; Griffin, D.C.; Gregory, D.C. (Physics Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6372). *Physical Review [Section] A: General Physics;* **38**: No. 1, 38-43(1 Jul 1988).

Absolute cross sections for electron-impact single ionization of Kr/sup 8+/ and Xe/sup 8+/ ions were measured for energies below the ionization thresholds to 1500 eV using the crossed-beams method. A significant fraction of the Kr/sup 8+/ and Xe/sup 8+/ ion beams were in metastable configurations. Configuration-average distorted-wave calculations for ions in the ground and first-excited configurations are compared to the experimental data. For both ions in this study, the excitation-autoionization contribution to the total ionization cross section is found to be much larger for ions in the first-excited configuration, which includes metastable levels, than for the ground-state ions. Maxwellian rate coefficients were calculated for Kr/sup 8+/ and are compared to published results.

38309 Extended low-frequency approximation for laser-modified electron scattering: Coulomb effects. Mittleman, M.H. (High Temperature Physics Division, Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *Physical Review [Section] A: General Physics;* **38**: No. 1, 82-92(1 Jul 1988).

The Kroll-Watson [N.M. Kroll and K. M. Watson, Phys. Rev. A 8, 804 (1973)] theory for electron scattering in the field of a low-frequency laser has been extended by L. Rosenberg [Phys. Rev. A 23, 2283 (1981); 28, 2727 (1983)] to apply to higher intensities. That result is rederived in another way so as to make the correction second order. The correction terms are obtained and shown to be small in the high-intensity low-energy regime in which the original theory is weakest. The special case of a Coulomb potential is analyzed and shown to present special peculiarities in the extended theory just as in the original Kroll-Watson theory.

38310 Comment on "The strange polarization of the classical atom" [Am. J. Phys. 55, 906 (1987)]. Biedenharn, L.C.; Brown, L.S.; Solem, J.C. (Department of Physics, Duke University, Durham, North Carolina 27706). *American Journal of Physics;* **56**: No. 7, 661-663(Jul 1988).

There has been much interest recently, both experimentally and theoretically, in "Rydberg atoms": atoms with large principal quantum number n. A classical treatment of the associated Coulomb field problem describes most of the features of these atoms. Using classical mechanics, Solem[1] recently showed the existence of an interesting, counterintuitive effect for an atom in a weak uniform electric field: The response of the electron was orthogonal to the direction of the applied field. This effect was shown both analytically by the method of variation of parameters and numerically by direct integration of the equations of motion. Such a basic effect in a simple system should, however, admit an elementary derivation. This we provide here.

38311 Electron-impact ionization cross sections for the xenon isoelectronic sequence. Younger, S.M. (A-Division, Lawrence Livermore National Laboratory, Livermore, California 94550). *Physical Review [Section] A: General Physics;* **37**: No. 11, 4125-4132(1 Jun 1988).

Cross sections are presented for the direct electron-impact ionization of the 5p, 5s, and 4d subshells of the ground state of the first six members of the xenon isoelectronic sequence. The calculations were performed in a distorted-wave Born-exchange approximation including the effects of term-dependent partial waves in the ejected-electron channel and ground-state electron correlation. Shape resonances were found to significantly enhance the cross sections at low incident electron energies for Xe, Cs^+, and Ba^{2+}. Term dependence in the $5p^5kd$ and $4d^9kf$ ejected-electron channels was also significant for these ions. Ground-state correlation was somewhat less influential, and affected the cross section only when ejected-electron term dependence was also significant.

38312 Fifth-harmonic production in neon and argon with picosecond 248-nm radiation. Rosman, R.; Gibson, G.; Boyer, K.; Jara, H.; S. T. Luk; McIntyre, I.A.; McPherson, A.; Solem, J.C.; Rhodes, C.K. (Laboratory for Atomic, Molecular, and Radiation Physics, Department of Physics, University of Illinois at Chicago, P.O. Box 4348, Chicago, Illinois 60680). *Journal of the Optical Society of America B: Optical Physics;* **5**: No. 6, 1237-1242(Jun 1988).

The results of a study of fifth-harmonic production in neon and argon irradiated with 248-nm picosecond laser pulses are presented. Focused intensities range from 10^{13} to 10^{15} Wcm^2. Data for fifth-harmonic intensity as a function of both target density and focused laser intensity are presented and compared with theory. For the laser intensities and medium densities studied, estimates for the linear and nonlinear components of Δk, the wave-vector mismatch between the fundamental and harmonic waves, indicate that the nonlinear component is much greater than the linear component.

38313 Spectra of copperlike and zinclike xenon: Xe XXV and Xe XXVI. Kaufman, V.; Sugar, J.; Rowan, W.L. (Atomic and Plasma Radiation Division, National Bureau of Standards, Gaithersburg, Maryland 20899). *Journal of the Optical Society of America B: Optical Physics;* **5**: No. 6, 1273-1274(Jun 1988).

The spectra of highly ionized xenon were generated in a tokamak plasma and photographed in the region 60—350 A with a 2.2-m grazing-incidence spectrograph. The $4s^2$—4s4p transitions of Zn-like xenon (Xe XXV) and all the 4l—4(l+1) transitions of Cu-like xenon (Xe XXVI) were measured with estimated uncertainties of +- 0.005 A. These measurements have been combined with previous wavelength measurements of Xe XXVI to determine energy levels. A value for the ionization energy of Xe^{25+} of 6 912 400 +- 3000 cm^{-1} (857.0 +- 0.4 eV) was derived.

38314 **A comparison of experiment, CEPXS/ONETRAN, TIGERP, and TIGER net electron emission coefficients for various bremsstrahlung spectra.** Ballard, W.P.; Lorence, L.J. Jr.; Snowden, D.P.; Van Lint, V.A.J.; Beale, E.S. (Sandia National Labs., Albuquerque, NM (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* NS-34: No. 6, 1569-1574(Dec 1987). (CONF-8707112—). Contract AC04-76DP00789.

From Annual conference on nuclear and space radiation effects; Snowmass Village, CO, USA (28 Jul 1987).

This work compares a carefully designed experiment to measure photoemission with the predictions of three different codes (CEPXS/ONETRAN, TIGERP, and TIGER) for the complex bremsstrahlung spectra typical of very intense pulsed power x-ray generators. The Monte Carlo codes TIGER and TIGERP can calculate the net photon-induced electron emission but accurate results may require that statistical error be minimized. CEPXS/ONETRAN is a new deterministic coupled electron/photon transport code that is faster than Monte Carlo and is not subject to statistical error. The comparison of net yields is a sensitive test of the relative accuracy and efficiency of these various codes. The authors find that all of the codes substantially agree with the experiments for the forward net yields. However, for reverse net yields from high-Z materials, the codes overpredict relative to measurements.

38315 **Rotationally and vibrationally inelastic collisions of NH_3 with Au(111): Experiment and theory.** Kay, B.D.; Coltrin, M.E.; Raymond, T.D. (Sandia National Labs., Albuquerque, NM 87185 (US)). pp 98 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper WCC 2.

The authors measured angular, velocity, and quantumstate distributions for ammonia molecules scattered from a gold (111) single crystal for a number of surface temperatures and incident beam energies. To explain the experimental observations, the authors developed a classical trajectory code for scattering of a rigid nonlinear molecule from a rigid flat gold surface. The authors' classical trajectory calculations predict the propensity for tumbling vs spinning seen experimentally. The distribution of scattered molecules is markedly non-Boltzmann with low-K states preferentially populated. The authors extended their classical trajectory model to include the umbrella vibrational motion in NH_3. The model predicts very efficient transfer of translational energy to the umbrella vibrational mode. The vibrational excitation is predicted to scale with the normal component of incident kinetic energy in agreement with the experimental observation.

38316 **Observation of collision-induced coherence and ground-state spin gratings in a flame.** Rahn, L.A.; Trebino, R. (Sandia National Labs., Combustion Research Facility, Livermore, CA 94550 (US)). pp 70 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper TUGG 43.

In four-wave mixing and induced-grating processes, collisions can dephase quantum-mechanical amplitudes that would otherwise destructively interfere. As a result, otherwise forbidden extra resonances occur in these nonlinear optical processes having strengths that increase with pressure. In particular, Raman-type processes have, in addition to the well-known term proportional to the population difference, rho$_{11}$/sup (O)/ - rho$_{22}$/sup (O)/, an additional collision-induced term/sup 2,3/ proportional to rho$_{11}$/sup (O)/ + rho$_{22}$/sup (O)/. Thus collisions can induce a Raman-type resonance between equally populated levels. In addition, collisions can cause population gratings to occur in nonresonant pumping conditions. In this process, it is the distortion introduced in the energy level structure of the atom or molecule by collisions that allows the necessary population transfer to occur. Previous experimental work has demonstrated these and other collision-induced effects in sodium in the presence of various buffer gases. The authors extend these measurements to a flame environment, where collision-sensitive processes are of great interest. In addition, the authors observe several new characteristics of collision-induced phenomena.

38317 **Sum frequency generation for surface vibrational spectroscopy.** Hunt, J.H.; Guyot-Sionnest, P.; Shen, Y.R. (UC-Berkeley, Center for Advanced Materials, Lawrence Berkeley Lab., Berkeley, CA 94720 (US)). pp 108 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper WGG 1.

Surface vibrational spectroscopy is one of the best means for characterizing molecular adsorbates. For this reason, many techniques have been developed in the past. However, most of them suffer from poor sensitivity, low spectral and temporal resolution, and applications limited to vacuum solid interfaces. Recently, the second harmonic generation (SHG) technique was proved repeatedly to be a simple but versatile surface probe. It is highly sensitive and surface specific; it is also capable of achieving high temporal, spatial, and spectral resolution. Being an optical technique, it can be applied to any interface accessible by light. The only serious drawback is its lack of molecular selectivity. An obvious remedy is the extension of the technique to IR-visible sum frequency generation (SFG). Surface vibrational spectroscopy with submonolayer sensitivity is then possible using SFG with the help of a tunable IR laser. The authors report here an SFG measurement of the C-H stretch vibration of monolayers of molecules at air-solid and air-liquid interfaces.

38318 **Radiative capture processes in hot plasmas.** Hahn, Y. (Univ. of Connecticut, Storrs (USA)). pp 23-74 of Atomic processes in electron-ion and ion-ion collisions. Brouillard, F. (ed.). New York, NY; Plenum Publishing Corporation (1986). (CONF-8509196—).

From NATO advanced study institute on physics of electron-ion and ion-ion collisions; Han sur Lesse, Belgium (30 Sep 1985).

The theory of electron capture by ionic targets is discussed and a calculational procedure for the evaluation of capture rates and cross sections is outlined. Scaling properties of the radiative and Auger transition probabilities are examined in detail. Sample calculations of dielectronic recombination (DR) rates and cross sections are given. Refinements for the basic calculation which are described. These include configuration interaction, intermediate coupling, orders of coupling, overlapping resonances, cascade effects, and the fine-structure effect. The effect of extrinsic electric fields on the DR cross section is considered and atomic process related to DR are summarized. Field-induced l-mixing, field mapping of the captured states, field ionization, and possible field-induced shifts of the captured high Rydberg states by time-dependent electric fields are all considered. 55 references, 24 figures, 4 tables.

38319 **Electron-ion collisions in the average-configuration distorted-wave approximation.** Pindzola, M.S.; Griffin, D.C.; Bottcher, C. (Oak Ridge National Lab., TN (USA)). pp 75-91 of Atomic processes in electron-ion and ion-ion collisions. Brouillard, F. (ed.). New York, NY; Plenum Publishing Corporation (1986). (CONF-8509196—). Contract AC05-84OR21400.

From NATO advanced study institute on physics of electron-ion and ion-ion collisions; Han sur Lesse, Belgium (30 Sep 1985).

Explicit expressions for the electron-impact excitation, ionization, and resonant-recombination cross sections are derived and numerical results are calculated in the distorted-wave approximation. Calculations using these expressions are applied to several types of phenomena in electron-ion scattering where comparison with other theoretical methods and experimental measurements can be made. 24 references, 5 figures.

38320 Experiments on electron-impact excitation and ionization of ions. Phaneuf, R.A. (Oak Ridge National Lab., TN (USA)). pp 117-156 of Atomic processes in electron-ion and ion-ion collisions. Brouillard, F. (ed.). New York, NY; Plenum Publishing Corporation (1986). (CONF-8509196—). Contract AC05-84OR21400.

From NATO advanced study institute on physics of electron-ion and ion-ion collisions; Han sur Lesse, Belgium (30 Sep 1985).

The quantitative study of inelastic collisions between electrons and ions has been motivated for many years by the astrophysical community. The need for accurate collision cross sections has been dramatically intensified during the last decade by the worldwide emphasis on controlled-thermonuclear-fusion research, and its development as a potential energy source. The energetic radiation from highly ionized impurities in such high-temperature plasmas represents a serious mode of energy loss which has thus far prevented such devices from reaching the required ignition temperature and confinement condition. The effect of impurity ions on plasma confinement is also poorly understood, and may perhaps even be beneficial under certain circumstances. Accurate models for plasmas require reliable cross section data for electron-impact excitation, ionization and recombination of these impurity ions. The present report will review some of the fundamental aspects and then focus on highlighting some of the important experimental results which have been produced during the interim period. 82 references, 24 figures, 1 table.

6404 Fluid Physics

REFER ALSO TO CITATION(S) 38326

38321 (AD-A—189940/0/XAB) MPD (magnetoplasmadynamic) thrust-chamber flow dynamics. Annual report, 1 October 1986-30 September 1987. (R and D Associates, Alexandria, VA (USA)). 29 Sep 1987. 60p. (RDA-TR—144200). NTIS, PC A04/MF A01.

Performance characteristics of Magnetoplasmadynamic(MPD) arcjets depend on proper matching of electromagnetic and fluid-mechanical constraints within the thrust chamber. Experimental measurements of internal-flow conditions during MPD arcjet operation are needed to guide developement of flow models and to assess the validity of theoretical predictions. Efforts are continuing in a corporative effort to apply an array of diagnostic techniques including time-, space-, and spectrally-resolved photography to examine MPD arcjet internal flows. Experimental elucidation of the internal flow structure is used to develop predictive models for optimal geometries and operating parameters. Probes have been used to map the current and voltage distributions within uniform height and flared annular channels. This work is concerned with the effect of thruster channel variations on the current conduction regions of the MPD internal flow. Other aspects of the internal flow structure that were modeled involve the transition of the input mass flow from neutral gas to electrically-conducting plasma. Scale sizes for the transition region were estimated in terms of the electrical and thermodynamic properties of the propellant gas (e.g., argon). These estimates indicate that the electrical conductivity of the flow can be established in distances that are small compared to the characteristic dimension for current conduction near the entrance to the arcjet thrust chamber.

38322 (AD-A—190295/6/XAB) Rail damage in a solid-armature rail gun. Final report. Brassard, T.; Homan, C.G. (Army Armament Research and Development Command, Watervliet, NY (USA). Benet Weapons Lab.). Dec 1987. 22p. (ARCCB-TR—87035). NTIS, PC A03/MF A01.

Plasma-arc-drive rail guns operate by forming a high-temperature plasma behind the projectile using a thin metal fuze. These systems achieve the highest projectile velocities (about 12 km /sec), since the driving force includes a substantial plasma pressure as well as the electromagnetic or Lorentz force. Unfortunately, severe rail damage occurs primarily from the intense temperatures generated by the plasma arc and the wiping motion of the armature itself. The solid-armature gun replaces the plasma armature with a conducting metal armature. Since the plasma arcing is reduced or eliminated, the projectiles are accelerated mainly by the Lorentz force. Thus, solid armature rail guns operate at lower projectile velocities. The important tradeoff is that there is a substantial reduction in rail damage for metal armature projectiles. The elimination of the plasma force limits projectile velocities in the metal-armature rail guns. A more-subtle limit is the speed at which the commutation process can take place. Although the latter limit is still not well understood, experimental evidence indicates a commutation limit may occur near 6 to 7 km/sec. This velocity limit is still attractive for Army tactical missions for rail guns. The actual rail damage occurring with two types of metal armatures, wire brush contactors and monolithic metal contactors, and new developments in barrel technology, such as superconducting augmentation, are presented in this report.

38323 (AD-A—190310/3/XAB) Plasma-gas interaction studies in a hybrid-plume plasma rocket. Annual report, 1 September 1986-30 August 1987. Chang-Diaz, F.R.; Yang, T.F. (Massachusetts Inst. of Tech., Cambridge (USA). Plasma Fusion Center). 30 Sep 1987. 31p. NTIS, PC A03/MF A01.

This report discusses the progress in the fluid modeling of a hybrid-plume plasma rocket and the heating of plasma in a tandem-mirror device. In the theoretical area, three tasks were accomplished: 1) a major advance has been made in the development of a numerical method for solving the time-dependent fluid equations for both ions and electrons in the plasma; 2) a mathematical model was formulated for studying the radio-frequency heating of the hot plasma in cylindrical geometry; and 3) an analysis on the performance characteristics of the hybrid plume rocket was carried out. Under funding of the instrumentation program, component fabrication is in progress. The coils have been delivered.

38324 (BUM—84) Linear waves and stability in ideal magnetohydrodynamics. Eckhoff, K.S. (Bergen Univ. (Norway). Dept. of Applied Mathematics). May 1987. 70p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752487/JAW.

Linear waves superimposed on an arbitrary basic state in ideal magnetohydrodynamics are studied by an asymptotic expansion valid for short wavelenghts. The theory allows for a gravitational potential, and it may therefore be applied both in astrophysics and in problems related to thermonuclear fusion. The linearized equations for the perturbations of the basic state are found in the form of a symmetric hyperbolic system. This symmetric hyperbolic system is shown to possess characteristics of nonuniform multiplicity, which implies that waves of different types may interact. In particular it is shown that the mass waves, the Alf-n waves, and the slow magnetoacoustic waves will persistently interact in the exceptional case where the local wave number vector is perpendicular to the magnetic field. The equations describing this interaction are found in the form of a weakly coupled hyperbolic system. This weakly coupled hyperbloc system is studied in a number of special cases, and detailed analytic results are obtained for some such cases. The results show that the interaction of the waves may be one of the major causes of instability of the basic state. It seems beyond doubt that the interacting waves contain the physically relevant parts of the waves, which often are referred to as ballooning modes, including Suydam modes and Mercier modes. 19 refs.

38325 (CONF-8804124—2) Solidification with natural circulation. Domanus, H.M.; Sha, W.T. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 19p. (CONF-8804124—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011197/JAW.

From Modeling control of casting and welding processes conference; Palm Coast, FL, USA (17 Apr 1988).

The solidification of a superheated liquid gives rise to buoyancy forces which cause motion of the remaining liquid, or natural circulation. The natural circulation can affect the rate of solidification as well as the shape of the solidified mass. This paper presents a numerical model to solve a set of conservation of mass momentum, and energy equations as a boundary value problem in space and an initial-value problem in time. This model is employed to predict the evolution of the coupled heat transfer and fluid flow characteristics in a solidifying superheated liquid. The results obtained from this model for a plane solidification system have been

compared with the usual pure-conduction solution as well as some available experimental measurements. 11 refs., 10 figs.

38328 **(SAND—88-0057C) Experimental measurements of pressure in water-entry cavities.** Wolfe, W.P.; Gutierrez, W.T. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 5p. (CONF-880740—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88007209/JAW.

From Cavitation and multiphase forum; Cincinnati, OH, USA (24 Jul 1988).

In order to expand the water-entry cavities data base to higher entry speeds and oblique angles and to obtain data for the time from minimum cavity pressure to cavity collapse, a water-entry test was performed in August, 1987, at the Naval Surface Warfare Center's (NSWC) Hydroballistics Facility in White Oak, Maryland. This paper presents the preliminary analysis of the data from that test. 6 refs., 7 figs.

38329 **(SAND—88-0067C) Forces and moments on a slender, cavitating body.** Hailey, C.E.; Clark, E.L.; Buffington, R.J. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 5p. (CONF-880740—3). NTIS, PC A02;3. Order Number DE88007208/JAW.

From Cavitation and multiphase forum; Cincinnati, OH, USA (24 Jul 1988).

Recently a numerical code has been developed at Sandia National Laboratories to predict the pitching moment, normal force, and axial force of a slender, supercavitating shape. The potential flow about the body and cavity is calculated using an axial distribution of source/sink elements. The cavity surface is assumed to be a constant pressure streamline, extending beyond the base of the model. Slender body approximation is used to model the crosaflow for small angles of attack. A significant extension of previous work in cavitation flow is the inclusion of laminar and turbulent boundary layer solutions on the body. Predictions with this code, for axial force at zero angle of attack, show good agreement with experiments. There are virtually no published data availble with which to benchmark the pitching moment and normal force predictions. An experiment was designed to measure forces and moments on a supercavitation shape. The primary reason for the test was to obtain much needed data to benchmark the hydrodynamic force and moment predictions. Since the numerical prediction is for super cavitating shapes at very small cavitation numbers, the experiment was designed to be a ventilated cavity test. This paper describes the experimental procedure used to measure the pitching moment, axial and normal forces, and base pressure on a slender body with a ventilated cavity. Limited results are presented for pitching moment and normal force. 5 refs., 7 figs.

38330 **(SAND—88-1110C) Cavitation inception in a turbulent shear flow.** O'Hern, T.J. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 34p. (CONF-880716—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011486/JAW.

From 1. national fluid dynamics congress; Cincinnati, OH, USA (24 Jul 1988).

Experimental investigations were made into the inception processes in a large turbulent free shear layer generated by a sharp edged plate in a water tunnel at Reynolds numbers up to 2 {times} 10^6. Optical techniques were used to study the relation of cavitation inception to flow characteristics, in particular to the coherent vortices of the free shear layer turbulent structure. Two distinct types of vortex motion were evident, primary spanwise and secondary longitudinal vortices. Cavitation inception consistently occurs in the secondary shear layer vortices and more fully developed cavitation is visible in both structures, with the streamwise cavities typically confined to the braid regions between adjacent spanwise vortices. Measurements of fluctuating pressures in the turbulent shear layer were made by holographically monitoring the size of air bubbles injected into the non-cavitating flow, showing that pressure fluctuations were much stronger than previously reported, with positive and negative pressure peaks as high as 3 times the freestream dynamic pressure, sufficient to explain the occurrence of cavitation inception at high values of the inception index. The occurrence of inception in the secondary vortices of the shear layer, and previous reports of velocity dependence of these cores, may provide the key to explaining the commonly observed Reynolds number scaling of the inception index in shear flows. 20 refs., 9 figs., 1 tab.

38331 **(UCRL—98678) A study of the vortex sheet method for solving the Prandtl boundary layer equations.** Puckett, E.G. (Lawrence Livermore National Lab., CA (USA)). Sep 1987. Contract W-7405-ENG-48;AC03-76SF00098. 10p. (CONF-8709292—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011346/JAW.

From 7. Gesellschaft fur Angewandte Mathematik und Mechanik conference on numerical methods; Louvain-la-Neuve, Belgium (9 Sep 1987).

The vortex sheet method for solving the Prandtl boundary layer equations is the most widely used means of satisfying the no-slip boundary condition in a random vortex method solution of the Navier-Stokes equations. It is a fractional step method in which random walks are used to solve the diffusion equation and particles, called 'sheets', are created at the boundary in order to satisfy the no-slip boundary condition. A review of those theoretical results currently known is presented including the consistency of the random walk/sheet creation process. The convergence of the method to Blasius flow is then demonstrated numerically and from the data presented rates of convergence in terms of the computational parameters are conjectured. 26 refs., 1 fig., 4 tabs.

38332 **Detection of radio-frequency signals emitted by an arc discharge.** Damas, M.C.; Robiscoe, R.T. (Physics Department, Montana State University, Bozeman, Montana 59717). *Journal of Applied Physics;* **64**: No. 2, 566-574(15 Jul 1988).

We analyze the nature of radiation signals detected from electrical arcing events originating on highly charged dielectric surfaces. Starting from a simple model of the arc current pulse, we calculate the electromagnetic radiation signal incident on a distant radio-frequency receiver. The receiver is tuned to some central frequency and operates in a given bandwidth. Because the receiver responds to the arc current derivative rather than the arc current itself, the detected radiation pulse profile can differ substantially from the current pulse profile, even when the receiver bandwidth is large compared to the reciprocal pulse width. This signal distortion significantly affects the interpretation of arc radiation data. To illustrate the point, we show that at high frequencies the detected pulse width carries very little information on the arc itself, and that even a scan of pulse width versus frequency may provide a misleading picture of possible arc dynamics. Finally, we argue that arc radiation data from radio-frequency measurements are most useful at low frequencies, when the receiver frequency and bandwidth are both comparable to the reciprocal arc duration.

38333 **Color-induced transition to a nonconventional diffusion regime.** Tsironis, G.P.; Grigolini, P. (University of California at San Diego, La Jolla, California 92093). *Physical Review Letters;* **61**: No. 1, 7-10(4 Jul 1988).

It is shown that the negative diffusion coefficients exhibited by the current approaches to the Fokker-Planck equation for non-Markovian and bistable processes result from assuming the diffusion

process to be stationary. The rejection of this assumption leads to predictions on the escape over a barrier agreeing with the physical arguments pertaining to the extremely colored-noise regime.

38334 **Lyapunov instability of dense Lennard-Jones fluids.** Posch, H.A.; Hoover, W.G. (Institute for Experimental Physics, University of Vienna, Boltzmanngasse 5, A-1090 Vienna, Austria). *Physical Review [Section] A: General Physics;* **38**: No. 1, 473-482(1 Jul 1988).

We present calculations of the full spectra of Lyapunov exponents for 8- and 32-particle systems in three dimensions with periodic boundary conditions and interacting with the repulsive part of a Lennard-Jones potential. A new algorithm is discussed which incorporates ideas from control theory and constrained nonequilibrium molecular dynamics. Equilibrium and nonequilibrium steady states are examined. The latter are generated by the application of an external field F/sub e/ through which equal numbers of particles are accelerated in opposite directions, and by thermostatting the system using Nose-Hoover or Gauss mechanics. In equilibrium (F/sub e/ = 0) the Lyapunov spectra are symmetrical and may be understood in terms of a simple Debye model for vibrational modes in solids. For nonequilibrium steady states (F/sub e/not =0) the Lyapunov spectra are not symmetrical and indicate a collapse of the phase-space density onto an attracting fractal subspace with an associated loss in dimensionality proportional to the square of the applied field. Because of this attractor's vanishing volume in phase space and the instability of the corresponding repellor it is not possible to observe trajectories violating the second law of thermodynamics in spite of the time-reversal invariance of the equations of motion. Thus Nose-Hoover mechanics, of which Gauss's isokinetic mechanics is a special case, resolves the reversibility paradox first stated by J. Loschmidt [Sitzungsber. kais. Akad. Wiss. Wien 2. Abt. 73, 128 (1876)] for nonequilibrium steady-state systems.

38335 **Analytical solutions for the trajectories and thermal histories of unforced particulates.** Cloutman, L.D. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550). *American Journal of Physics;* **56**: No. 7, 643-645(Jul 1988).

Dilute suspensions of finely dispersed particulates are found in many engineering applications. This article shows that the nonlinear equations of motion and heat transfer for the particles may be solved analytically for certain realistic drag and heat transfer functions under idealized conditions. Some applications are discussed.

38336 **Doering et al. reply.** Doering, C.R.; Bagley, R.J.; Hagan, P.S.; Levermore, C.D. (Department of Physics, Clarkson University, Potsdam, New York 13676). *Physical Review Letters;* **60**: No. 26, 2805-2805(27 Jun 1988).

A reply to the comment on bistability driven by weakly colored gaussian noise is presented.The fokker-planck boundary layer and mean first-passage times are evaluated.It is agreed that there is a difference between the two first-passage times, and that alternative may be more appropriate for quantitative comparison with the low lying spectrum of the Fokker-Planck operator. (AIP)

38337 **Diocotron instability for intense relativistic nonneutral electron flow in planar diode geometry.** Davidson, R.C.; Tsang, K.T.; Uhm, H.S. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physics of Fluids;* **31**: No. 6, 1727-1737(Jun 1988).

The extraordinary-mode eigenvalue equation is used to investigate detailed properties of the diocotron instability for sheared, relativistic electron flow in a planar diode. The theoretical model is based on the cold-fluid-Maxwell equations assuming low-frequency flute perturbations about a tenuous electron layer satisfying ω^2/sub p//sub b/(x)<<ω^2/sub c/ and chemical bondω-kV/sub y/(x)chemical bond^2<<ω^2/sub c/. The cathode is located at x = 0; the anode is located at x = d; the outer boundary of the electron layer is located at x = x^+/sub b/<d; and the inner boundary of the layer is located at x = x^-/sub b/<x^+/sub b/. The extraordinary-mode

38338 **Random vortex methods for the Navier—Stokes equations.** Chien-Cheng Chang. (Lawrence-Berkeley Laboratory and Department of Mathematics, University of California, Berkeley, California 94720). *Journal of Computational Physics;* **76**: No. 2, 281-300(Jun 1988).

Two random vortex methods of Runge—Kutta type are presented for solving the two-dimensional Navier—Stokes equations. We intesgitate the accuracy of these methods by considering the model problem of a rotating flow with initial vorticity concentrated uniformly on a disk of finite radius. Functionals of the numerical solution are computed by Monte Carlo estimates with efficient variance reduction, and the results are compared to those obtained from Euler's method. The numerical results show that both the methods produce errors smaller by one power of the time step size than Euler's method, one seemingly even better than the other. These Runge—Kutta methods are derivations of similar schemes proposed by us in an earlier time for solving stochastic differential equations with constant diffusion coefficients. copyright 1988 Academic Press, Inc.

38339 **Solution of the diffusion equation by finite elements in Lagrangian hydrodynamic codes.** Shestakov, A.I.; Harte, J.A.; Kershaw, D.S. (Computational Physics Division, Lawrence Livermore National Laboratory, P.O. Box 5508, Livermore, California 94550). *Journal of Computational Physics;* **76**: No. 2, 385-413(Jun 1988).

The radiation diffusion equation is solved by the finite element method. The energy densities are point centered. These are integrated into a program architecture which requires zonally averaged quantities. Numerical results are presented which compare the scheme with existing finite difference techniques for zonal variables. Finite elements give better results for transport dominated problems on non-orthogonal meshes such as might be generated by Lagrangian hydrodynamic distortions. copyright 1988 Academic Press, Inc.

38340 **Numerical study of superfluid turbulence in the self-induction approximation.** Buttke, T.F. (Department of Mathematics and Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720). *Journal of Computational Physics;* **76**: No. 2, 301-326(Jun 1988).

Two stable numerical methods are presented to solve the self-induction equation of vortex theory. These numerical methods are validated by comparison with known exact solutions. A new self-similar solution of the self-induction equation is presented and the approximate solutions are shown to converge to the exact solution for the self-similar solution. The numerical method is then generalized to solve the equations of motion of a superfluid vortex in the self-induction approximation where reconnection is allowed. A careful numerical study shows that the mesh spacing of the method must be restricted so that the approximate solutions are accurate. The line length density of a system of superfluid vortices is calculated. Contrary to earlier results it is found that the line length density produced does not scale as the velocity squared and therefore is not characteristic of homogeneous turbulence. It is concluded that the model equationn used is inadequate to describe superfluid turbulence. copyright 1988 Academic Press, Inc.

38341 **Multipulse pre-breakdown phenomena in liquid dielectrics.** Alexeff, I.; Blalock, T.V.; Wintenberg, A.L.; Foust, J.V.; Pace, M.O. (Dept. of Electrical and Computer Engineering, Univ. of Tennessee, Knoxville, TN 37996-2100 (US)). pp 115 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—).

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

The authors previously observed pre-breakdown behavior from a point in liquid before breakdown as a series of increasing current pulses. Each pulse is generally accompanied by a light flash. In addition, bubble formation is observed. They now developed the following model, which closely fits many of the experimental observations, as well as giving insights into the breakdown process. A bubble detaches from the tip and grows, due to the repulsive electric charges on its inside surface. As the bubble grows,

the electrostatic potential drops, due to the dimension change. This results in a growing potential difference between the bubble and the point. When this difference causes a critical field to appear at the tip, a flashover occurs, a current pulse and a light flash are produced, the bubble charges bck to the tip potential, and the process repeats. Experimental results include as good fit to the observed pulse height vs pulse number, if the effective tip radius is 1/20 of the tip radius used (3 micrometer). The latter observation suggests that the pulse train is initiated by a dust particle in the fluid.

Some final results are presented on μμ, {tau}{tau}, and hadron production, obtained by the MARK J collaboration at PETRA, over the cm energy band 22 GeV to 46.8 GeV. The MARK J results agree with world averaged data. They constitute powerful tests of the predictions of the Standard Model. 29 refs., 8 figs., 3 tabs.

38347 **(BNL—52091) "Follow that quark!" (and other exclusive stories).** Carroll, A.S. (Brookhaven National Lab., Upton, NY (USA)). 17 Jun 1987. Contract AC02-76CH00016. 23p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010340/JAW.

Quarks are considered to be the basic constituents of matter. In a series of recent experiments, Carroll studied exclusive reactions as a means of determining the interactions between quarks. Quantum Chromo-dynamics (QCD) is the modern theory of the interaction of quarks. This theory explains how quarks are held together via the strong interaction in particles known as hadrons. Hadrons consisting of three quarks are called baryons. Hadrons made up of a quark and an antiquark are called mesons. In his lecture, Carroll describes what happens when two hadrons collide and scatter to large angles. The violence of the collision causes the gluons that bind the quarks in a particular hadron to temporarily lose their grip on particular quarks. Quarks scramble toward renewed unity with other quarks, and they undergo rearrangement, which generally results in additional new particles. A two-body exclusive reaction has occurred when the same number of particles exist before and after the collisions. At large angles these exclusive reactions are very rare. The labels on the quarks known as flavor enable the experimenter to follow the history of individual quarks in detail during these exclusive reactions. Carroll describes the equipment used in the experiment to measure short distance, hard collisions at large angles. The collisions he discusses occur when a known beam of mesons or protons collide with a stationary proton target. Finally, Carroll summarizes what the experiments have shown from the study of exclusive reactions and what light some of their results shed on the theory of QCD.

38348 **(BONN-HE—87-30) Particle production at collider energies.** Geich-Gimbel, C. (Bonn Univ. (Germany, F.R.). Physikalisches Inst.). Nov 1987. 161p. NTIS (US Sales Only), PC A08/MF A01. Order Number DE88753534/JAW.

Key features of the SPS panti p Collider and the detectors of the UA-experiments involved are dealt with in chapter 2, which includes and accord to the ramping mode of the Collider, which allowed to raise the c.m. energy to 900 GeV in the UA5/2 experiment. The following chapters concentrate on physics results. Starting with a discussion of cross sections and diffraction dissociation in chapter 3 we then continue with a presentation of basic features of particle production such as rapidity and multiplicity distributions in chapter 4. There one of the unexpected findings at Collider energies, the breakdown of the so-called KNO-scaling, and new regularities potentially governing multiplicity distributions, are discussed. The findings about correlations among the final state particles, which may tell about the underlying dynamics of multi-particle production and be relevant to models thereof, are described in due detail in chapter 5. Transverse spectra and their trends with energy are shown in chapter 6. Results on identified particles are collected in a separate chapter in order to stress that this piece of information was an important outcome of the UA5 experiment. (orig./HSI).

38349 **(DOE/ER/40272—54) Continuum charm production in e^+-e^- annihilation at root s = 10.55 GeV.** Garren, L. (Florida Univ., Gainesville (USA). Dept. of Physics). Apr 1988. Contract FG05-86ER40272. 12p. (CONF-880331—5; UFTP—88-3). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011617/JAW.

From 3. Lake Louise Winter Institute on quantum chromodynamics: theory and experiment; Lake Louise, Canada (6 Mar 1988).

The author reports results on the differential and total cross sections for inclusive production of the charmed particles D/sup *+/, D/sup *0/, D^0, D^+, D/sub s/, and Λ/sub c/ in e^+e^- annihilations at root s = 10.55 GeV. Relevant quark fragmentation models

are compared with the measured charmed particle distributions. We measure B(D/sup *+/ -> D°π^+) = 0.52 +/- 0.07 +/- 0.11.

38350 **(IFVE-OEF—87-44) Observation of the asymmetry in the πp parrow up -> ($\pi^0\pi^0$)n reaction.** Apokin, V.D.; Belikov, N.I.; Derevshchikov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702066/JAW.

The experimental results on polarization asymmetry in the π^-p/sub f/ -> ($\pi^0\pi^0$) n reaction at 39.1 GeVc are presented. A negative asymmetry ~ 10% is observed in the $\pi^0\pi^0$-mass region of 600-110 MeVc^2, and it enhances to ~ 30% in the region of F_2(1270 and f_4(2030)-resonances. 10 refs.; 7 figs.

38351 **(IFVE-OEIUNK—87-62) Investigation of neutral strange particle correlation in pp interactions at 360 GeV/c.** Asai, M.; Aziz, M.; Baland, Zh. and others. (Hiroshima Univ. (Japan); Tata Inst. of Fundamental Research, Bombay (India); Mons Univ. (Belgium)). (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702857/JAW.

Production properties and corrections for K/sub S/°K/sub S/°, K/sub S/°Λ, K/sub S/°Λ-bar and $\Lambda\Lambda$-bar system in 360 GeVc pp interactions are presented. All rapidity difference distributions are observed to peak at $\Delta Y=0$. Experimental results are in good agreement with the quark fusion and Lund models of particle production. 7 refs.; 3 figs.

38352 **(IFVE-ONF—87-60) Study on the K^+p -> $K^0 2\pi^+\pi^-p$, K^+p -> $K^0 3\pi^+ 2\pi^-p$ reactions and their diffractive channels at 32 GeVc.** Gerdyukov, L.N.; Shlyapnikov, P.V.; Makharadze, T.G.; Tomaradze, A.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 11p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702075/JAW.

Results of study of the main characteristics of the reactions K^+p -> $K^0 2\pi^+\pi^-p$, K^+p -> $K^0 3\pi^+ 2\pi^-p$ and their diffractive dissociation channels K^+ -> $K^0 2\pi^+\pi^-$, K^+ -> $K^0 3\pi^+\pi$-, obtained in experiment with the hydrogen bubble chamber "Mirabelle" are presented. 8 refs.; 8 figs.

38353 **(IFVE-ONF—87-81) Study on the nucleon structure functions in neutrino interactions in energy range of 10-200 GeV.** Ammosov, V.V.; Burtovoj, V.S.; Gapienko, V.A. and others. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 19p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702859/JAW.

Submitted to the journal Sov. J. Nucl. Phys. .

The results on measurement and analysis of the nucleon structure functions F_2 and xF_3 obtained in the (anti)neutrino experiment in the 15 foot bubble chamber are presented. The scaling violation in the non-singlet structure function is analysed in terms of the perturbative QCD. The perturbative QCD scale parameter was found to be: Λ/sub M-barS-bar/=0.17 +- 06 (stat)+-0.12(syst) GeV. The attempt to determine a contribution of higher twist effects in scaling violation are also made. 28 refs.; 7 figs.; 5 tabs.

38354 **(INFN-LNF—87-105(R)) Analysis of nucleon form factor data reveals the e^+e^-->nucleon-antinucleon cross section to be remarkably larger than the e^+e^-->proton-antiproton one.** Dubricka, S. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1987. 31p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702863/JAW.

A modified six-resonance VMD model for a description of the nucleon electromagnetic structure is constructed. It possesses correct analytic properties and the asymptotic behaviour in accordance with a quark model prediction for baryons. Only parameters with clear physical meaning are contained in the model. They are evaluated numerically in a simultaneous fit of all existing data on electric and magnetic nucleon form factors. As a result, the behaviour in the time-like region of electric and magnetic neutron form factors, for which there are no data up to now, has been predicted. In comparison with the corresponding behaviour of proton form factors above the nucleon-antinucleon threshold one finds them to exceed by a factor of five. Consequently the cross section of e^+e^-->nucleon-antinucleon is expected to be roughly twenty-five-times as large as the cross section of e^+e^-->proton-antiproton. 58 refs.

38355 (INIS-mf—11223, pp 9-58) **High transverse momentum electrons in the UA2 experiment.** Bagnaia, P.; Banner, M.; Battiston, R. (European Organization for Nuclear Research, Geneva (Switzerland); CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France); Perugia Univ. (Italy)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The final results of the search for electrons with transverse momentum p/sub T/ > 15 GeVc carried out in the data sample available from the UA2 experiment are given. The main motivation for this study is a comparison with improved statistics between the experimental data and the expectations from reactions p-bar + p -> W^{+-} + anything where W^{+-} -> e^{+-} + ν (ν-bar) and p-bar + p -> Z^0 + anything where Z^0 -> $e^+ + e^-$ or $e^+ + e^- + \gamma$. A general discussion is presented on the topology of all events which contain a high p/sub T/ electron candidate, in particular with regard to the possible presence of hadronic jets in some of these events. 11 refs., 4 tabs. and 15 figs. (M.F.W.).

38356 (INIS-mf—11223, pp 113-122) **Improved measurement of neutrino-electron scattering with the CHARM calorimeter.** Bergsma, F.; Dorenbosch, J.; Allaby, J.V. 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

A new experimental determination of the electroweak mixing angle θ/sub w/ is reported based on a second exposure of the CHARM calorimeter to the CERN SPS wide-band beam. The ratio R of muon-neutrino and muon-antineutrino electron scattering cross-sections has been determined from a sample of 37 +- 10 and 35 +- 10 events. The experimental result is R = 1.26 + 0.72-0.45, corresponding to a value of $\sin^2\theta$/sub w/ = 0.216 +- 0.055. The total sample of events collected in the CHARM calorimeter during the two exposures is (83 +- 16) ν/sub μ/e events and (112 +- 21) ν-bar/sub μ/e events, leading to the final result $\sin^2\theta$/sub w/ = 0.215 +- 0.032. The systematic error is estimated to be +- 0.012. 8 refs., 2 figs.

38357 (INIS-mf—11223, pp 247-259) **Spectroscopy in the γ region.** Wegener, D. (Dortmund Univ. (Germany, F.R.). Inst. fuer Physik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The results available from the ARGUS detector, a new detector built for DORIS electron positron storage ring, are presented. The first results on the T(2S) -> $\pi^+\pi^-$T(1S) and T(2S) -> $\gamma+1^3$P/sub j/ decays , the fragmentation functions of charmed quarks into D/sup */-and F-meson and the first results on B-meson decay are discussed. 17 refs., 12 figs., 1 tab. (M.F.W.).

38358 (INIS-mf—11223, pp 579-587) **QCD effects in final state hadrons from deep inelastic muon scattering.** Janata, F. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Experimentalphysik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

New results are presented from an experiment on deep inelastic muon-proton scattering performed by the European Muon

Collaboration. Effects predicted by QCD are investigated by studying the final state hadrons. It is found that the predictions of the quark-parton and fragmentation models are sufficient to explain the W dependence of the total charged multiplicity whereas clear evidence for perturbative and nonperturbative QCD effects can be demonstrated by the behaviour of the transverse momentum of the final state hadrons. 12 refs., 7 figs.

38359 (INIS-mf—11223, pp 607-615) **TASSO results on baryon production in high energy e^+e^- annihilation jets.** Pandoulas, D. (Hamburg Univ. (Germany, F.R.). 2. Inst. fuer Experimentalphysik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The measured yields of baryon production in high energy e^+e^- annihilation make possible the study of events in which at least two baryons are detected in the final state. Clear evidence is found that the mechanism for baryon-antibaryon production in e^+e^- annihilation is dominated by local compensation of baryon number. Production of decuplet baryons is found to be strongly suppressed with respect to octet baryon production. At 95% confidence there are on average <0.10 Δ^{++} and <0.09 Σ/sup *+-/ per event (inclusive of antiparticles). 15 refs., 3 figs.

38360 (INIS-mf—11223, pp 163-175) **Large transverse momentum π^0 and direct photon production in π^-p, π^+p and pp collisions at 300 GeVc.** De Marzo, C.; De Palma, M.; Favuzzi, C. (Bari Univ. (Italy). Ist. Nazionale di Fisica Nucleare; Bari Univ. (Italy). Ist. di Fisica). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Preliminary results on large transverse momentum π^0 and direct photon production in π^-p, π^+p and pp collisions at 300GeVc are presented. It was found that the $\gamma\pi^0$ cross-section ratio is increasing with increasing p/sub T/ for π^-p, π^+p and pp collisions. No striking difference between the direct photon production cross-section in π^-p and π^+p collisions has been observed up to p/sub T/=5 GeVc. 9 refs., 9 figs.

38361 (INIS-mf—11223, pp 189-199) **Squark versus top quark production. Zen events at the CERN collider.** Argyres, E.N.; Contogouris, A.P.; Tanaka, H. (State Univ. Coll., Plattsburgh, NY (USA); McGill Univ., Montreal, Quebec (Canada). Dept. of Physics). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

First, production of top quark decaying into bottom electron and neutrino versus production of squark decaying into quark, electron and sneutrino is studied in p-barp collisions at $\sqrt{s}$=540 GeV. With branching ratios determined in detail, it is found that squark production well exceeds that of top quark except when the gluino is heavy. Next, using certain cross sections obtained before, the recently observed zen events (monojet or "photon" plus missing p/sub T/) are explained in terms of squark production and the decay squark -> quark + photino. 12 refs., 2 figs.

38362 (INIS-mf—11223, pp 239-245) **Short and long range correlation of hadrons in pp-bar collisions at 540 GeV.** Boeckmann, K.; Eckart, B. (Bonn Univ. (Germany, F.R.). Physikalisches Inst.). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Forward-backward multiplicity correlations and two-particle pseudorapidity correlations are investigated in pp-bar collisions at 540 GeV. The analysis in terms of a simple cluster approach yields values of k/sub eff/ $\sim$ 2.5 for the effective cluster size for the decay in charged particles and a decay width for the clusters of $\delta \sim 0.7$ units in pseudorapidity. These values are almost unchanged when compared with those determined at ISR energies. 14 refs.

38363 (INIS-mf—11223, pp 297-311) **Kaon and baryon production in high p/sub T/ pp,dd and $\alpha\alpha$ interactions at ISR energies.** Szczekowski, M. (Institute of Nuclear Research, Warsaw (Poland); European Organization for Nuclear Research, Geneva (Switzerland)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The fractions of kaons and baryons are determined for high p/sub T/ collisions of protons, deuterons and alpha particles at ISR energies. The fractional yield of protons depends strongly on a scattering angle whereas the one for antiprotons remains constant. The measured particle ratios depend on the atomic weight A of the beam particles. 5 refs., 12 figs.

38364 (ITEF—113(1987)) **Observation of the strange exotic resonances in $\Lambda\pi i\pi^+$ system.** Drutskoj, A.G.; Mikhajlichenko, V.I.; Nikitin, S.Ya.; Kiselevich, I.L.; Shidlovskij, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 12p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702102/JAW.

Search for strange exotic baryon resonances is carried out in π^+p-interaction at 4.23 GeVc π^+-meson momentum. Except ΛPI^+PI^+ mass distribution, characteristic properties of mass spectra of exotic states don't exceed .5 μb. Exceedings over the phase volume of $PI^+p \to \Lambda K^0PI^+PI^+$ reaction in the spectrum of effective ΛPI^+PI^+ masses are detected. Methods for phase distribution construction are described taking into account $\Sigma^{0+}(1385)$ and $K^{0+}(890)$ known resonances and separation of resonance peaks. 11 refs.; 1 tab.; 5 refs.

38365 (KEK—87-7, pp 56-63) **Partial wave analysis of K^+K-bar/sub S/π^- final state.** Protopopescu, S.D. (Brookhaven National Lab., Upton, NY (USA)). Jul 1987. NTIS (US Sales Only), PC A22/MF A01. Order Number DE88780074/JAW. (CONF-8704177—).

From 2. international conference on hadron spectroscopy; Tsukuba, Japan (16 Apr 1987).

A partial wave analysis of high statistics data collected by AGS Experiment no.771 in reaction $\pi^-p \to K^+K$-bar/sub S/$\pi^- + n$ shows evidence for a 1^{++} and a 0^{-+} state in the 1280 MeV region, a 0^{-+} state in the 1420 MeV region and a 1^{++} state in the 1500 MeV region. Preliminary data from reaction $K^-p \to K^+K$-bar/sub S/$\pi^- + X$ are presented.

38366 (KFK—4359) **Search for narrow lines in photon spectra from proton-antiproton annihilations at rest.** Schwertel, J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Physik). Feb 1988. 115p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753391/JAW.

Inclusive photon spectra from annihilation of antiprotons stopped in a liquid hydrogen target were measured at LEAR (CERN) with a magnetic pair spectrometer. The FWHM energy resolution of the spectrometer in the region from 100-700 MeV was in the range from 2 to 4.5%. A total number of about $4.8.10^6$ events with energies up to 1 GeV have been reconstructed. The photon spectra were scanned for possible lines with widths comparable to spectrometer resolution indicating the existence of bound nucleon-antinucleon states. No such structures were found with branching ratios greater than 4 to 8.10^{-4} at 95% confidence level. Results of former experiments could not be confirmed.

38367 (LA—11273-T) **Measurement of the left-right asymmetry in pion-proton radiative exchange and charge exchange scattering from 301 to 625 MeV/c on a transversely polarized target.** Kim, George Jung-Kwang. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 151p. NTIS, PC A08/MF A01;1; GPO Dep. Order Number DE88009808/JAW.

The left-right asymmetry A/sub N/ in π/sup {minus/}p $\rightarrow$ γn has been measured at p/sub π = 301, 316, 427, 471, 547, 586, and 625 MeV/c using a transversely polarized target. The final-state neutron and gamma were detected in coincidence by two states of matching neutron and gamma detectors at gamma angles centered around 90{degree and 110{degree} c.m. A gamma detector consisted of an array of 15 counters, each was 15{times}15{times}25 cm^3 block of lead-glass. A neutron detector consisted of 15 counters also, each one was a cylindrical plastic scintillator 7.6 cm in diameter and 45.7 cm long. The A/sub N/ results are compared with the predictions from the most recent single-pion photoproduction partial-wave analysis by Arai and Fujii. The agreement is poor, casting doubt on the correctness of the value for the radiative-decay amplitude of the neutral Roper resonance now in use. A comparison is made with the 90{degree}recoil proton polarization data of the inverse reaction derived from γd scattering, there are substantial discrepencies. Charge exchange (π/sup {minus/p} $\rightarrow$ γ{degree}n) events were the major yield in this experiment. Very precise values of the charge exchange analyzing power were obtained with an error of typically 3%. The charge exchange results are compared with the predictions from recent γn partial wave analyses. At the lower incident energies little difference is seen between the VPI, Karlsruhe-Helsinki, and CMU-LBL analyses, and there is excellent agreement with our experiment. From the onset of the Roper resonance the VPI solution is strongly favored.

38368 (LA-UR—88-1729) ETA meson production at LAMPF. Peng, J.C. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 13p. (CONF-8803108—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010951/JAW.

From Workshop on production and decay of light mesons; Paris, France (3 Mar 1988).

Recent experiments at LAMPF to study pion-induced eta meson production are discussed. Results from the π/sup {minus/}p $\rightarrow$ {eta}n and π/sup {minus/3}He $\rightarrow$ {eta}t reactions, potentially useful for tagged-{eta} production, are presented. Mass and energy dependence of the inclusive (π,{eta}) cross sections are shown to provide information on {eta}-nucleus interaction. Preliminary results from a BNL experiment to search for {eta}-nucleus bound states are presented.

38369 (LBL—23737) Charged hadron production in e/sup {+/}e/sup {-/} annihilation at $\sqrt{s}$ = 29 GeV. Aihara, H.; Alston-Garnjost, M.; Avery, R.E.; Barbaro-Galtieri, A.; Barker, A.R.; Barnett, B.A.; Bauer, D.A.; Bengtsson, H.U.; Bobbink, G.J.; Buchanan, C.D. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 98p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88008396/JAW.

We have used data from the Time Projection Chamber at the SLAC storage ring PEP to study the inclusive production of charged hadrons in e/sup {+/}e/sup {-/} annihilation at a center of mass energy of 29 GeV. Charged particles were identified by simultaneous dEdx and momentum measurements. We present cross sections and particle fractions for π{sup{plus+-minus}}, k^{+-}, and p{ovr{p}}} as a function of energy, momentum, rapidity, and transverse momentum. We compare the predictions of various hadronization models to the data and note discrep ncies at high momentum.

38370 (LBL—24729) The inclusive cross section of charged hadrons in 3-jet events at $\sqrt{s}$ = 29 GeV. Rouse, F.R. (Lawrence Berkeley Lab., CA (USA)). Oct 1987. Contract AC03-76SF00098. 235p. NTIS, PC A11/MF A01;1; GPO Dep. Order Number DE88008241/JAW.

We examine the cross section for the production of charged hadrons in 3-jet events produced from e/sup {plus/e/sup {minus/} annihilation at 29 GeV center of mass energy. The data was taken at the Pep-4Time Projection Chamber between 1983-1984. In particular we are interested in the production of hadrons by the particle which mediates the strong interaction, the gluon. We find that the number of protons produced by the fragmentation of the gluon is at variance with the LUND model of fragmentation. 85 refs., 72 figs., 29 tabs.

38371 (LBL—25353) Threshold behavior of direct electron production in proton-beryllium collisions. Naudet, C.; Krebs, G.F.; Lallier, E.; Letessier-Selvon, A.; Matis, H.S.; Roche, G.; Schroeder, L.; Seidl, P.; Yegneswaren, A.; Wang, Z.F. (Lawrence Berkeley Lab., CA (USA); California Univ., Los Angeles (USA). Dept. of Physics; Johns Hopkins Univ., Baltimore, MD (USA). Dept. of Physics; Louisiana State Univ., Baton Rouge (USA). Dept. of Physics and Astronomy; Northwestern Univ., Evanston, IL (USA). Dept. of Physics). May 1988. Contract AC03-76SF00098. 8p. (CONF-8805142—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012017/JAW.

From 3. conference on the intersections between particle and nuclear physics; Rockport, ME, USA (14 May 1988).

The authors report measurements of direct electron pair production in p-Be interactions at 1.0, 2.1 and 4.9 GeV kinetic beam energies. The invariant mass and p/sub t/ spectra along with the total cross sections are presented. A rapid decrease in the total cross section is observed at the lowest energy.

38372 (PITHA—87-22) Dimuon production at the CERN p anti p collider. Moser, H.G. (Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Experimentalphysik 3B und 3. Physikalisches Inst.; Technische Hochschule Aachen (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). Oct 1987. 201p. NTIS (US Sales Only), PC A10/MF A01. Order Number DE88753392/JAW.

In panti p collisions at 630 (540) GeV centre of mass energy heavy quarks are copiously produced, mainly by gluon fusion. About 10% of them decay semileptonically into muons. In order to study heavy quark physics at the collider, we selected dimuon event satisfying following cuts: P/sub t/ $>$ 3 GeVc (each muon) m/sup $\mu\mu$/ $>$ 6 GeVc^2. (orig.HSI).

38373 (SLAC-PUB—4607) Evidence for D/sub s/ decay to {eta}π from Mark III. Brient, J.C. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Mar 1988. Contract AC03-76SF00515;AC02-76ER01195;AC03-81ER40050. 5p. (CONF-880399—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010151/JAW.

From 23. Rencontre de Moriond: current issues in hadron physics; Les Arcs, France (13 Mar 1988).

This paper presents the evidence for a decay mode of the D/sub s/ state, obtained using the Mark III detector at the e/sup {plus/}e/sup {minus/} storage ring SPEAR. We report the observation of the decay Ds/sup {plus/} $\rightarrow$ {eta}π/sup {plus/} in two channels ({eta} $\rightarrow$ $\gamma\gamma$ and {eta} $\rightarrow$ π/sup {plus/}π/sup {minus/}π^0). The product branching fraction is measured to be σ(e/sup {plus/}e/sup {minus/} $\rightarrow$ D/sub s//sup {plus/}D/sub s/*/sup {minus/} + c.c.) {times} B(D/sub s//sup {plus/} $\rightarrow$ {eta}π/sup {plus/}) = 80 +- 20 +- 25 pb and 74 +- 19 +- 25 pb for the $\gamma\gamma$ and π/sup {plus/}π/sup {minus/}π^0 channels, respectively. These values are approximately twice the rate of D/sub s/ $\rightarrow$ {phi}π.

38374 (SLAC-PUB—4613) Semileptonic Λ/sub c/$^+$ decays with the Mark II at PEP. Klein, S. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1988. Contract AC03-76SF00515. 5p. (CONF-880399—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010150/JAW.

From 23. Rencontre de Moriond: current issues in hadron physics; Les Arcs, France (13 Mar 1988).

Semileptonic Λ/sub c/$^+$ decays have been observed in 29 GeV e$^+$e/sup {minus/ annihilation. We observe the channels Λ/sub c/$^+$ $\rightarrow$ e$^+$AX and Λ/sub c/$^+$ $\rightarrow$ $\mu\mu$AX. The production rate for Λ/sub c/$^+$, times Br(Λ/sub c/ $\rightarrow$ l$^+$AX) of 0.0031 +- 0.0012 +- 0.0010 per hadronic event for electrons, and 0.0024 +- 0.0007 per hadronic event for muons. When combined with the Lund model prediction for Λ/sub c/$^+$ production, this gives semileptonic branching ratios of roughly 5% about what is expected. When combined with the UCLA model prediction for Λ/sub c/$^+$ production, this gives semileptonic branching ratios of 17% and 13% for electrons and muons, somewhat higher than expected.

38375 Formation of spin-one mesons by photon-photon fusion. Aihara, H.; Alston-Garnjost, M.; Avery, R.E.; Barbaro-Galtieri, A.; Barker, A.R.; Barnett, B.A.; Bauer, D.A.; Bay, A.; Bengtsson, H.; Bobbink, G.J.; and others. (Lawrence Berkeley Laboratory, Berkeley, California 94720 University of California, Davis, California 95616 University of California Intercampus Institute for Research at Particle Accelerators, Stanford, California 94305 University of California, Los Angeles, California 90024 University of). *Physical Review* [*Section*] *D: Particles and Fields;* **38**: No. 1, 1-18(1 Jul 1988).

We have observed the formation of two spin-one mesons in $\gamma\gamma$ fusion reactions in which one photon was highly virtual. The first, consistent with being the J/sup P//sup C/ = 1/sup ++/ $f_1(1285)$, was seen in the final state eta$\pi^+\pi^-$ (eta→$\gamma\gamma$), as was the eta'(958). We have previously reported the observation of the second spin-one state, the X(1420), in the final state K/sup +- /K/sub S/$^0\pi$/sup minus-or-plus/ (K/sub S/^{0}→$\pi^+\pi^-$). The formation of this state, which may be the $f_1(1420)$ observed in hadronic interactions, is reanalyzed using a new model and more data. We consider whether the X(1420) could be the partner of the $f_1(1285)$ in the J/sup P//sup C/ = 1/sup ++/ meson nonet. The $\gamma\gamma$/sup */ width of each resonance was determined in several Q^2 bins. Using a model due to Cahn with a rho form factor, we obtained for the coupling parameter Gamma-tilde/sub γ//sub γ/($f_1(1285)$) the value 2.4 +- 0.5 +- 0.5 keV.

38376 New measurements of properties of the Ωp hyperon. Luk, K.B.; Beretvas, A.; Deck, L.; Devlin, T.; Rameika, R.; Whitman, R.; Handler, R.; Lundberg, B.; Pondrom, L.; Sheaff, M.; and others. (Department of Physics and Astronomy, Rutgers: The State University, P.O. Box 849, Piscataway, New Jersey 08854). *Physical Review* [*Section*] *D: Particles and Fields;* **38**: No. 1, 19-31(1 Jul 1988).

We have obtained a sample of 1743 reconstructed Ω^-→ΛK^- events produced by protons on a Be target at production angles of 5.0 and 7.5 mrad. The Ω^- lifetime, based on a subset of 1096 events, was measured to be tau(Ω^-) = (0.811 +- 0.037) x 10^{-10} sec, where the uncertainty is statistical and the systematic uncertainty is estimated to be small. The helicity of the daughter Λ yielded the product of asymmtery parameters α/sub Λ/α/sub Ω/ = -0.022 +- 0.051 which, in turn, yields α/sub Ω/ = -0.034 +- 0.079. The average daughter-Λ polarization in the decay region was measured to be P/sub Λ/ = 0.12 +- 0.08 approximately perpendicular to the charged-hyperon beam line. The Ω^- polarization in the same region, i.e., after the precession magnet, depends on the sign of γ/sub Ω/, which is unknown at present. The two possibilities are P/sub Ω/ = P/sub Λ/ if γ/sub Ω/≅+1 and P/sub Ω/ = -(5/3P/sub Λ/ if γ/sub Ω/≅-1. The magnitude of the polarization vector is only 1.5 standard deviations different from zero, and this prevented a meaningful measurement of the Ω^- magnetic moment. If the broken-SU(6) prediction for the moment, $\mu(\Omega^-)$ = -1.83μ/sub N/, is assumed to be true, then the precession of the Ω^- in the magnetic field is small and the values of P/sub Ω/ above are also true at the production target. If this polarization is different from zero and correct in sign, then it cannot be simultaneously reconciled with theoretical predictions for the sign of γ/sub Ω/ and for the sign of the production polarization.

38377 Production of flavor-changing gauge bosons from E_6 at e^+e^- and hadron colliders. Rizzo, T.G. (Ames Laboratory and Department of Physics, Iowa State University, Ames, Iowa 50011). *Physical Review* [*Section*] *D: Particles and Fields;* **38**: No. 1, 71-77(1 Jul 1988).

We have studied the production and corresponding decay signatures of flavor-changing neutral gauge bosons which can arise when E_6 breaks to give a new low-energy gauge group SU(2)/sub I/ at e^+e^- and hadron colliders. The non-Hermitian gauge bosons (W/sub I/) in this group couple conventional fermions (e.g., e,d/sup c/) to their exotic partners (E,h/sup c/) in the 27 representation of E_6. The dominant mechanism for W/sub I/ production in hadron-hadron collisions at the parton level is found to be g+d→W/sub I/+h, which leads to a substantial cross section at both the Superconducting Super Collider and the CERN Large Hadron Collider as well as distinct decay signatures. Pair production of W/sub I/ at high-energy e^+e^- colliders is found to be sensitive to detailed cancellations between the different amplitudes. Sizable production cross sections of order 1 pb are obtained.

38378 Increased statistics and observation of the g/sub T/, gsub(T'), and g(subT'') 2^{++} resonances in the glueball enhanced channel π^-p -> phiphin. Etkin, A.; Foley, K.J.; Hackenburg, R.W.; Longacre, R.S.; Love, W.A.; Morris, T.W.; Platner, E.D.; Saulys, A.C.; Lindenbaum, S.J.; Chan, C. (Brookhaven National Lab., Upton, NY (USA); City Coll., New York (USA)). *Physics Letters* [*Section*] *B;* **201**: No. 4, 568-572(18 Feb 1988). Contract AC02-76CH00016;AC02-83ER40107.

In a new experiment we have obtained 3006 new events in the reaction π^-p -> phiphin, approximately doubling the statistics which now total 6658. A refined partial wave analysis of the phiphi system again reveals three resonances (g/sub T/, gsub(T'), gsub(T'')) with I/sup G/J/sup PC/ = 0^+2^{++}. The absence of the OZI suppression, and the observation of only three J/sup PC/ = 2^{++} states (g/sub T/, gsub(T'), gsub(T'')) which comprise virtually all the cross section are unusual characteristics of the data. The large phiphin signal occurs over a mostly structureless and incoherent phiK^+K^-n background. All these unusual characteristics are well explained if these states are produced by 1-3 glueballs (multigluon resonances).

38379 Associated production of weak bosons and heavy quarks with hadron colliders. Halzen, F.; Kim, C.S. (Physics Dept., Univ. of Wisconsin, Madison, WI (US)). *International Journal of Modern Physics A;* **2**: No. 4, 1069-1074(Aug 1987). (CONF-8705163—).

From Madison SSC workshop: from colliders to supercolliders; Madison, WI, USA (11 May 1987).

The authors calculate the joint production of W/sup +-/ and top quarks via the leading order diagrams bt-bar→W and bg-bar→Wt. Although the latter contribution is O(α/sub s/) the authors find it to be sizeable and to subtract from the leading order bt-bar→W. The calculations are of interest as they represent the dominant background in the search of charged Higgs particles H/sup +-/ → tb-bar in the minimal SUSY model With this in mind the authors also present results for the rho/sub T/ distribution of the top and the dilepton invariant mass resulting from leptonic decay of both particles in the Wt final state.

38380 Production of heavy squarkonium at the SSC. Herrero, M.J.; Mendez, A.; Rizzo, T.G. (Theory Group, Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). *International Journal of Modern Physics A;* **2**: No. 4, 1121-1130(Aug 1987). (CONF-8705163—).

From Madison SSC workshop: from colliders to supercolliders; Madison, WI, USA (11 May 1987).

The authors study the production of heavy bound sttes of squarks at the SSC and analyse their decays into longitudinal W's and Z's. In some situations a squarkonium state can be detected through its decay into a pair of W's.

38381 Planned neutrino electron experiment. White, D.H. (Los Alamos National Lab., NM (USA)). pp 16 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

H^- beam from the 800 MeV linear accelerator at LAMPF is injected into a proton storage ring (PSR) and extracted in a pulse 250ns long. It is proposed that this beam be used to generate a time separated neutrino source from stopped pions and muons in a beam stop utilizing the time structure and the lifetimes of the pion (26 ns), and muon (2200ns). The ratio of neutrino electron scattering from pion decay and muon decay is sensitive to sin ^{2}theta/sub w/, the mixing angle of the electroweak theory. A measurement of the ratio of cross sections is expected to give a precision of 1% on sin ^{2}theta/sub w/, testing precisely the form of the theory.

38382 Hadronic matter in collision: Proceedings of the second international workshop on local equilibrium in strong interaction physics. Carruthers, P.; Stottman, D. Teaneck, NJ; World Scientific Pub. Co, (1986). 537p. (CONF-860440—). World Scientific Pub. Co., 687 Hartwell Street, Teaneck, NJ 07666.

From 2. international workshop on local equilibrium in strong interaction physics: hadronic matter in collision; Santa Fe, NM, USA (9 Apr 1986).

This book contains papers given at a conference on hadronic matter in collision. Some of the topics include the following: Nuclear Fragmentation; Nucleus-Nucleus Reactions; Phase Transformations; Hydrodynamics of Nuclear Matter; Hadron Hadronic Multi-Particle Production; and Bose Einstien Correlations.

6452 Particle Interactions And Properties - Theoretical

38383 (BNL—41182) Measurement of hadronic exclusive reactions at high momentum transfer as tests of perturbative QCD [quantum chromodynamics]. Carroll, A.S. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 12p. (CONF-880331—4). NTIS, PC A03;3. Order Number DE88010230/JAW.

From 3. Lake Louise Winter Institute on quantum chromodynamics: theory and experiment; Lake Louise, Canada (6 Mar 1988).

Exclusive reactions are defined and described in terms of perturbative QCD. Color transparency is discussed, and exclusive reactions are compared. (LEW)

38384 (BNL—41255) Proton decay by monopoles and strings. Matheson, A. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 6p. (CONF-8803109—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88010669/JAW.

From 23. Rencontre de Moriond conference: electroweak interactions and unified theories; Les Arcs, France (6 Mar 1988).

Order-of-magnitude estimates are obtained for fermion-monopole and fermion-string scattering, taking into account the effect of the monopole or string on the fermion wavefunction. As a result, it is concluded that monopoles will catalyze proton decay with a strong cross-section (the Callan-Rubakov effect) whereas for strings the process has a geometrical cross-section. The difference is explained as being due to a long range attractive potential between the fermion and the monopole, and the absence of long range fields in the case of the string.

38385 (DOE/ER/40200—139) Comparison of exact and effective gauge boson calculation for gauge boson fusion processes. Abbasabadi, A.; Repko, W.W.; Dicus, D.A.; Vega, R. (Michigan State Univ., East Lansing (USA). Dept. of Physics and Astronomy; Texas Univ., Austin (USA). Center for Particle Theory). Mar 1988. Contract FG05-85ER40200. 23p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010243/JAW.

The exact perturbative calculations for the gauge boson fusion processes W^+W/sup {minus/} $\rightarrow$ W^+W/sup {minus/}, W^+W/sup {minus/} $\rightarrow$ Z^0Z^0, and W^+W/sup {minus/} $\rightarrow$ H^0H^0 are compared with the corresponding effective gauge boson calculations. These comparisons enable us to study the several forms of the gauge boson distribution functions and draw some conclusions about their non-leading terms. In addition, it is possible to study effects of various rapidity cuts on the exact and approximate calculations. For rapidity cuts {eta}/sub C/ satisfying $1.0 \leq$ {eta}/sub C/ ≤ 2.0, the agreement is excellent. Larger rapidity cuts reveal factor of 2–3 disagreements when the invariant mass of the final state is large compared to the Higgs mass. In all cases, the agreement near the Higgs peak is good. The discrepancies are discussed in terms of the extra diagrams which occur in the exact calculations and the t-channel singularities which are present in the effective gauge boson calculations.

38386 (DOE/ER/40228—T1) [Theoretical studies in high energy physics]: Final technical report. Braaten, E. (Northwestern Univ., Evanston, IL (USA). Dept. of Physics and Astronomy). [1988]. Contract FG02-85ER40228. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011606/JAW.

The research activities that were supported by this grant were focused primarily on low energy quantum chromodynamics. Significant progress was made in the Skyrme model for baryons, string models for color flux tubes, hadronic decays of the {tau} lepton, technicolor models of the electroweak interactions, and meson form factors in perturbative QCD.

38387 (DOE/ER/40235—T3) Theoretical studies in elementary particle physics. Collins, J.C. (Illinois Inst. of Tech., Chicago (USA)). 1988. Contract FG02-85ER40235. 12p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88006929/JAW.

This report briefly discusses the elementary particle physics research being done at Illinois Institute of Technology. Some of the work in progress is: understanding the foundations of perturbative QCD in its applications to hadron-hadron scattering; studies of the QCD predictions for the angular distribution of the muons produced in the Drell-Yan process; the small-x regime and cosmic ray signals from Cygnus X-3.

38388 (FNAL/C—88/32) Beauty physics at the ultrahigh energies of the ELOISATRON [Euroasiatic Long Intersecting Superconducting Accelerator Synchrotron]. Cox, B. (Fermi National Accelerator Lab., Batavia, IL (USA)). Feb 1988. Contract AC02-76CH03000. 11p. (CONF-8706291—1). NTIS, PC A03;3. Order Number DE88008053/JAW.

From 5. INFN-ELOISATRON workshop on new aspects of very high energy proton proton physics; Erice, Italy (1 Jun 1987).

The potential for experimentally studying B physics at the proposed INFN 100 TeV ELOISATRON (Euroasiatic Long Intersecting Superconducting Accelerator Synchrotron) is compared with possibilities at 40 TeV at the Superconducting Super Collider. The effect of the increase in center of mass energy on the production and decay of B mesons has been investigated, particularly with respect to the accummulation of large samples of B hadron decays necessary for the detection of CP violating effects. 13 refs., 7 figs., 1 tab.

38389 (FNAL/C—88/33) Experimental possibilities for observation of CP violation in B decay. Cox, B. (Fermi National Accelerator Lab., Batavia, IL (USA)). Feb 1988. Contract AC02-76CH03000. 30p. (CONF-8709147—10). NTIS, PC A03;3. Order Number DE88008055/JAW.

From International symposium on the production and decay of heavy flavors; Stanford, CA, USA (1 Sep 1987).

The detection and the measurement of CP violation in the decays of B hadrons will require the accumulation of large numbers of B decays in particular exclusive modes. The potential of beauty hadroproduction experiments for obtaining these large data samples is examined in the context of various trigger and analysis strategies. The possibilities for doing such experiments at present hadron machines is compared with the potential for such experiments at the SSC. 3 refs., 3 figs., 4 tabs.

38390 (IFVE-OTF—87-9) Mass formula for mesons containing light quarks. Khrushchev, V.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 5p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702081/JAW.

Two-parametric mass formula for mesons, which contain u- and d-quarks, is proposed and the mass values for radially excited states of π- and rho-mesons and mesons with large spin are calculated. This values coincide with experimental ones within 1-3% of accuracy for orbitally excited states and for radially excited states - within 3-6%. 12 refs.; 2 tabs.

38391 **(IFVE-OTF-ONF/OEIUNK—87-23) Search for B/sub s/-meson oscillations in high energy hadronic beams.** Volkov, G.G.; Likhoded, A.K.; Slabospitskij, S.R. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov. Inst. Fiziki Vysokikh Ehnergij). 1987. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702087/JAW.

Simple expressions which approximate well the differential cross sections obtained in the frames of the parton model are given for inclusive beauty hadron spectra produced in the hadron beam. The possibilities for the search of B-bar/sub S/ reversible B/sub S/-meson oscillations produced in the Σ^--hyperon beam by detecting decay leptons along the track are considered. The decay contribution of all the beauty B-mesons is shown to worsen considerably the possibility of the experiment, i.e., the expected error may exceed the measured value itself. 9 refs.; 3 figs.

38392 (INIS-mf—11223, pp 231-237) **Jet calculus beyond the leading log approximation.** Szymanowski, L. (Institute of Nuclear Research, Warsaw (Poland)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The jet calculus beyond leading log approximation is reviewed. New results on the gluon decay vertices are presented. 12 refs.

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The structure function $F_3(x,Q^2)$ is discussed for lepton scattering of quarks at finite density at $Q^2 >> 1(GeVc)^2$. 10 refs., 3 figs.

38395 (INIS-mf—11223, pp 495-501) **Hadron instability and planar Regge trajectories.** Glushko, N.I.; Kobylinski, N.A.; Shelest, V.P.; Tutik, R.S. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki; Dnepropetrovskij Gosudarstvennyj Univ. (Ukrainian SSR)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Hadronic spectrum is shown to be influenced by the resonance instability which should be taken into account when we reconstruct "bare" hadron spectrum or planar Regge trajectories. It was found that the spectrum of orbital excitations thickens at planar level. Some consequences of this fact are discussed. 7 refs., 2 figs., 1 tab.

38396 (INIS-mf—11223, pp 511-522) **Analytic pion form factor with higher rho resonances.** Dubnicka, S.; Martinovic, L. (Slovenska Akademia Vied, Bratislava (Czechoslovakia). Fyzikalny Ustav). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

It is shown that is possible to reconstruct experimental behaviour of the pion form factor in the whole measured region -10 $GeV^2 < t < 10\ GeV^2$ within the model based on well-known analytic properties of the pion ff. The brief skech of such model in terms of parameters with clear physical meaning, which includes contributions of radially excited rho states and which is flexible in a choice of the asymptotic form is discussed. 17 refs., 3 figs., 1 tab. (M.F.W.).

38397 (INIS-mf—11223, pp 523-566) **Universal tadpole dynamics.** Scadron, M.D. (Arizona Univ., Tucson (USA). Dept. of Physics). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Nonperturbative quark tadpole graphs are shown to drive strong, semistrong, electromagnetic, parity-violating weak and parity-conserving weak hadron dynamics. Almost fifty low energy hadron data are then predicted from four energy parameters, each of them having their origin in the quark model. Finally the Cabbibo angle is computed in terms of the semi-strong nonperturbative parameters. 60 refs., 21 figs.

38398 (INIS-mf—11223, pp 567-577) **Relativistic potential model for baryons.** Turski, A. (Warsaw Univ. (Poland). Inst. Fizyki Teoretycznej). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The possibility of extending the quark-diquark model to describe the excited nucleon states was investigated using the relativistic equations with spin. It was found that the simplest model doesn't work, except for correct predictions for the fine-structure splittings. The last result supports the use of the relativistic equations with spin for describing the spin-orbit interactions. 14 refs., 3 tabs.

38399 (INIS-mf—11223, pp 91-112) **Search for heavy spinless boson in electron-positron annihilation.** Brandt, S.; Dahmen, H.D. (Siegen Univ. (Gesamthochschule) (Germany, F.R.). Abt. fuer Physik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The cross sections for fermion- and photon pair production in $e^+ e^-$ annihilation through intermediate spinless bosons are discussed. Limits for the boson mass and its couplings are given as obtained in PETRA experiments. 15 refs., 8 figs.

38400 (INIS-mf—11223, pp 123-132) **Topics on the Lorentz structure of charged weak interactions.** Mursula, K. (Bern Univ. (Switzerland). Inst. fuer Theoretische Physik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

A brief summary of some theoretical and phenomenological topics related to the Lorentz structure of charged weak interactions is given. In particular the limits to some additional non-standard interactions and their implications are reviewed. A method to measure the chirality of the top quark in weak production is discussed and comment on the limits to right-handed currents from the neutrinoless double beta decay is made. 12 refs., 4 figs.

38401 (INIS-mf—11223, pp 133-142) **Can one observe one-loop effects in leptonic processes?.** Grzadkowski, B.; Pawelczyk, J. (Warsaw Univ. (Poland). Inst. Fizyki Teoretycznej). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The possibility of the experimental testing of the Glashow-Salam-Weinberg model at the one-loop level is investigated in leptonic processes. 7 refs., 2 figs., 3 tabs.

38402 (INIS-mf—11223, pp 143-161) **On the W and Q^2 dependence of fragmentation functions as measured in leptoproduction.** Schmitz, N. (Max-Planck-Institut fuer Physik und Astrophysik, Muenchen (Germany, F.R.). Inst. fuer Physik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Some problems and questions related to the W (hadronic effective mass) and Q^2 (four-momentum transfer) dependence of fragmentation functions as measured in leptoproduction are discussed. The main results obtained on this subject in previous experiments are reviewed. New data on νp and ν-barp scattering from a BEBC experiment suggest that in the present energy range fragmentation functions depend on W and (at fixed W) not on Q^2. The increase of particle production with increasing W seems to occur only at small Feynman-x/sub F/, i.e. in the central region, suggesting that it is mainly due to the kinematical widening of the available rapidity range with increasing W. 27 refs., 5 figs.

38403 (INIS-mf—11223, pp 377-386) **Search for supersymmetric particles in e^+e^- annihilation at PETRA.** Komamiya, S. (Heidelberg Univ. (Germany, F.R.)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The possibilities of supersymmetric particles production in e^+e^- annihilation are studied. Since the mass spectra of supersymmetry are different from model to model, it is not easy to make searches in a model independent way. Hence mass limits themselves have no physical meaning unless assumptions are specified. The author tries to make clear what kind of assumptions has been made for each particle search. 9 refs., 13 figs., 2 tabs. (M.F.W.).

38404 (INIS-mf—11223, pp 177-187) **QCD effects in weak boson production.** Chiappetta, P. (Centre National de la Recherche Scientifique, 13 - Marseille (France). Centre de Physique Theorique). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The weak boson production is studied in perturbative QCD through the Drell Yan picture. A satisfactory agreement with UA1 and UA2 data is found. Predictions are also made at tevatron energies. 27 refs., 6 figs.

38405 (INIS-mf—11223, pp 201-207) **Can top be visible in CERN collider?.** Kurek, K. (Institute of Nuclear Research, Warsaw (Poland)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The estimates of the top quark production are made within a parton perturbative QCD model. The masses of the top quarks were taken into account in the kinematics and the evolution equations. The semileptonic weak decay of the heavy quark is considered as a possible signal of top flavour production. The number of events with high-p/sub T/ (>15 GeV) leptons from such decays is calculated for CERN collider. 22 refs., 1 fig.

38406 (INIS-mf—11223, pp 209-220) **Diquark scattering as a source of high p/sub T/ protons.** 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

As an additional source of large p/sub T/ protons in hard proton-proton interactions the scattering of valence diquarks is proposed. A quantitative analysis of the proposed mechanism is presented and the model calculations are compared with the data. 16 refs., 8 figs., 1 tab. (M.F.W.).

38407 (INIS-mf—11223, pp 331-336) **N-n-bar oscillations in nuclear matter.** Sanchez-Gomez, J.L. (Universidad Autonoma de Madrid (Spain)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

A treatment of n-n-bar oscillations in nuclear matter more complete than the optical model is presented. The expression for the nuclear annihilation width reduced per neutron is done. 7 refs., 2 figs. (M.F.W.).

38408 (INIS-mf—11223, pp 59-90) **Upper bounds on the Higgs mass (spectrum and mass formula in the Higgs sector).** Rodenberg, R. (Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl fuer Experimentalphysik 3B und 3. Physikalisches Inst.). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Using radiative corrections as the origin of spontaneous symmetry breaking (SSB), in the one- and in the two-loop approximation charged and neutral Higgs boson masses can be derived easily. Taking into account that B_0, a possible representant of the pseudotensor term, the axion a_0 and the supersymmetric U-boson belong to the same spectrum in the Higgs sector, experimental constrains allow to estimate m/sub H(sup 0)/ $<\sim$ 349 GeV and m/sub H(sup +-)/ $<\sim$ 125 GeV for a wide range of top quark masses of about 35 GeV $<\sim$ m/sub t/ $<\sim$ 80 GeV. 61 refs., 11 figs.

38409 (INIS-mf—11223, pp 387-398) **Recent work on chiral Lagrangians.** Golowich, E. (Massachusetts Univ., Amherst (USA). Dept. of Physics and Astronomy). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The concept of a chiral Lagrangian is briefly reviewed and several classical examples are presented. More recent work is then discussed, including applications to kaon and nucleon physics. The role of higher-order derivative couplings, loops and soliton solutions is stressed. 13 refs., 3 tabs.

38410 (ITEP—19(1987)) **Second Z-boson and electroweak mixing angle.** Polyakov, N.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 8p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702110/JAW.

The cross-section ratio of neutral-current neutrino scattering on nucleons in models with one (standard model) and two Z-bosons is calculated. Its value is found to be $\sim$ 1.15 for the mass m_2 of Z_2-boson being $m_2 \sim$ 200 GeV (the modern lower boundary for m_2). Obtained more severe restriction on m_2:m_2 >or approx. 500-700 GeV. 3 refs.; 4 figs.

38411 (ITEP—62(1987)) **Trinucleons as a multi-quark system.** Kalashnikova, Yu.S.; Narodetskij, I.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 35p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702890/JAW.

A new approach for investigation of the three-nucleon system is suggested in which it is assumed that the short-range interaction of nucleon clusters within trinucleons is described in terms of wave functions of virtual multiquark configuration. It is shown that the effective three-nucleon Hamiltonian contains the three-body forces arising from the dynamics of overlaping bags in the trinucleons. The latters, however, may be eliminated by a proper redifinition of the nucleon component in a nine-quark wave function. The integral equation for the three-nucleon wave function which has the form of the standard Faddeev equation but requires the phase-equivalent redefinition of the initial form of NN potential in the Quark Compound Bag method is derived. 19 refs.; 4 figs.

38412 (ITEP—77(1987)) On quantum correction to the Skyrmion mass. Eremeev, M.I.; Konoplich, R.V.; Kudryavtsev, A.E.; Martem'yanov, B.V.; Rubin, S.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 16p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702891/JAW.

Quantum correction to the "classical" nucleon mass is calculated taking into account radial fluctuations around the hedgehog Skyrme solution. The quantum correction pushes down the Skyrme-soliton mass if one choose the arbitrary mass scale of the theory M ~ m/sub rho/, where m/sub rho/ is the rho-meson mass. The nucleon and Δ-isobar mass difference is obtained correctly when the Lagrangian parameter E/sub π/=125 MeV. The value F/sub π/ is in a better agreement with pion-decay constant F/sub π/=186 MeV than the value F/sub π/=108 MeV that was obtained previously in the framework of the Skyrme model without the consideration of the vibrational quantum corrections. 12 refs.; 2 figs.; 1 tab.

38413 (ITEP—79(1987)) Multibaryon masses in quark models: quark potential model versus bag model. Kalashnikova, Yu.S.; Narodetskij, I.M.; Simonov, Yu.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 18p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702113/JAW.

A quasiclassical approximation in the hyperspherical formalism is applied to calculate the spectra of some 6q, 9q and 12q states in the quark potential model (QPM). The quasiclassical approximation is shown to lead to very accurate predictions for the masses of multiquark states. The significant difference in the predictions for masses of multiquark states in the QPM and bag model (400 MeV for 6q, 800 MeV for 9q and 1400 MeV for 12q) is shown to be due to the faster increase of the multiquark potential energy in the QPM and may be removed if the confining potential damps at small distances. 28 refs.; 3 figs.; 8 tabs.

38414 (ITEP—85(1987)) Higher twist effects in QCD description of light meson exclusive formfactors. 1. General approach and twist 3 wave functions. Gorskij, A.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 28p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702892/JAW.

The general approach to a quantitative description of higher twist effects in hard exclusive processes in QCD is proposed. The consistent calculations in coordinate space and the choice of special gauges for quantum and classical gluon fields are essential ingradients of this method. The self consistent system of twist three wave functions for π-meson has been built. 28 refs.; 7 figs.

38415 (ITEP—148(1987)) Neutrino magnetic moment in a theory with lepton flavor symmetry. Stephanov, M.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702893/JAW.

A model for generating the neutrino magnetic moment of the order of 10^{-10} μ/sub B/ is proposed, which is based on the SU(3) lepton flavor symmetry. In such a way one can avoid the flavor changing processes. The experimental constraints on the constants of the model are considered. 6 refs.; 1 fig.

38416 (ITEP—158(1987)) Strange diquarks and orbital excitations of hyperons. Kondratyuk, L.A.; Ralchenko, Yu.V.; Vasilets, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 17p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702894/JAW.

Using the model of the QCD string with spin-orbital interaction the masses of strange diquarks are determined. The spectra of orbital excitations of the Λ and Σ hyperons are calculated and discussed. Also the decay modes for Λ's and Σ's are considered. 11 refs.; 5 figs.

38417 (ITP—87-3) Correlation between dilepton emission and hadronic multiplicity in ultrarelativistic nuclear collisions as the signal of a deconfinement phase transition. Gorenstein, M.I.; Pavlenko, O.P. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1987. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702898/JAW.

In scaling-hydrodynamic model for ultrarelativistic nuclear collisions the correlation between lepton pair emission and hadronic multiplicity is studied in central rapidity region. The sharp increase in dilepton emission with hadronic multiplicity is the signal of quark-hadron mixed phase formation. 10 refs.; 1 fig.

38418 (JINR—E-2-87-483) Wide scalar gluonium and the quark-antiquark scalar nonet. Lanik, J. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 19p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702433/JAW.

Submitted to the journal Zeit. Phys., C.

The couplings of scalar gluonium as well as quark-antiquark scalar nonet states to the pseudoscalar mesons are discussed on the basis of the low-energy theorems of broken chiral symmetry and scale invariance implemented using phenomenological Lagrangian. Mixing between pure gluonium σ and the SU(3)/sub F/ singlet quarkonium S_0 is considered. Taking for the mases of S_0 and σ the values based on estimates of the quark model and of recent QCD lattice calculations, respectively, and using the "standard" values of the gluon condensate, the mixture of S_0 and σ in the physical states G and ϵ is predicted to be approximately half-and-half. G is predicted to have properties consistent with the $F_0(1590)$ meson, while ϵ is predicted to be the wide effective gluonium state below 1 GeV. On this basis it is suggested that a possible consistent description of the whole scalar qq-bar nonet. The picture contains S*(975) neither as qq-bar nor as qq state and thus still more exotic interpretation of the S*(975) effect is supported. 33 refs.

38419 (JINR-E—2-87-355) Cumulative hadron production in quark models of flucton fragmentation. Efremov, A.V.; Kim, V.T.; Lykasov, G.I.; Slavin, N.V.; Kaidalov, A.B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics; Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 16p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702906/JAW.

Submitted to the journal Sov. J. Nucl. Phys. .

Quark models of cumulative particle production and the EMC-effect are analyzed. It is shown that all these models are characterized by universal relation of the cumulative nucleon spectrum with the production cross section of cumulative particles containing nuclear valence quarks. testing of this relation for a deuteron is carried out and the role of secondary nuclear processes for heavy nuclei is discussed. Special role of "sea" cumulative particles (K^-, p-bar) for understanding the nature of the EMC-effect is discussed. 43 refs.; 5 figs.

38420 (JINR-E—2-87-370) Calculation of moments of structure function of deep inelastic scattering in QCD. Kotikov, A.V. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702907/JAW.

Submitted to the journal Theor. Math. Phys. .

The method of uniqueness is applied to calculate the moments of structure functions of deep inelastic scattering in QCD. Examples are given of calculations of multiloop diagrams which depend on two momenta, when the square of one of them equals zero. The method can be used in other theories where Wilson's operator product expansion is applied. It can also be used to calculate propagator-type diagrams with a large number of momenta in lines. 11 refs.; 7 figs.; 1 tab.

38421 (JINR-E—2-87-543) Deep inelastic scattering in the formalism with the wave functions of composite systems at rest. Khvedelidze, A.M.; Kvinikhidze, A.N.; Sisakyan, A.N. (AN Gruzinskoj SSR, Tbilisskij Matematicheskij Inst.; Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702908/JAW.

Submitted to the journal Z. Phys. .

A deep inelastic process of lepton-hadron scattering is studied in the bound-state rest frame. A new version of expansion of structure functions over an interaction constant is proposed, each term in it having spectral properties. It is shown that the impulse approximation is insufficient for a correct description of the elastic limit in the composite particle rest frame in contrast with the system of infinite momentum P/sub Z/ -> ∞. The leading asymptotics of the structure functions as x/sub Bj/ -> 1 can be obtained by allowing for the interaction of consituents in a final state. Using as an example a bound state ot two and three particles it is shown that the results of calculations of the relevant diagrams in the QCD model are in agreement with those obtained in th formalism P/sub Z/ -> ∞. 9 refs.; 4 figs.

38422 (JINR-E—2-87-548) P-barp annihilation in the dual parton model and perturbative QCD. Kopeliovich, B.Z.; Zakharov, B.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems; AN SSSR, Moscow. Inst. Fiziki Zemli). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702909/JAW.

Submitted to the journal Sov. J. Nucl. Phys. .

In the framework of perturbative QCD the contribution to the annihilation cross section resulting from exchange of two gluons in the colour decuplet state is calculated. The result depends essentially on the diquark radius, and is equal to 1-2 mb. This contribution slightly varies with energy and dominates the annihilation cross section in the asymptotics. The preasymptotical mechanism of annihilation is also considered which causes fast decrease in the cross section with energy ($\sim 1/\sqrt{E}$) at the intermediate energies E < 12 GeV. 41 refs.; 8 figs.

38423 (JINR-R—2-87-450) Relativistic operator quantization and confinement in QCD. Pervushin, V.N.; Nguyen Suan Han. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 18p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702927/JAW.

Submitted to the journal Int. J. Modern Phys., A.

A new (nonpotential) mechanism of confinement for the foundation of the local quark-hadron duality principle is considered. This mechanism may be realized in the scheme of quantization of the gauge theories with the explicit solution of the Gauss equation and dynamic fixed gauge, where relativistic transformations of classical and quantum fields coincide. Theoretical and phenomenological arguments of separating the confinement from dynamics of the hadronization are discussed. 27 refs.

38424 (LA-UR—88-1494) The nucleon as a pionic nontopological soliton or beyond the cloudy bag model. Bolsterli, M.; Parmentola, J.A. (Los Alamos National Lab., NM (USA); West Virginia Univ., Morgantown (USA)). 1988. Contract W-7405-ENG-36. 11p. (CONF-880560—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010953/JAW.

From Topical conference on nuclear quantum chromodynamics; Argonne, IL, USA (19 May 1988).

This paper describes the Los Alamos soliton model of the nucleon that was developed in order to incorporate core motion into the cloudy-bag model of the nucleon.

38425 (LAPP-TH—201-87) Vertex operator representation of OSp(M/N). Frappat, L. (Annecy Univ., 74 (FR)). (Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules). Sep 1987. 21p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753970/JAW.

Using the boson-fermion equivalence in 2-d conformal field theory and the boson-boson equivalence of the superconformal bosonic ghost fields of the string theory, we construct a level k = +1 representation of the affine superalgebra OSp (M/N) in terms of vertex operators.

38426 (LBL—25247) Jet physics in e^+e^- annihilation: evidence for the running of α_s. Bethke, S. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 11p. (CONF-880399—3). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012015/JAW.

From 23. Rencontre de Moriond: current issues in hadron physics; Les Arcs, France (13 Mar 1988).

The energy dependence of the relative production rate of 3-jet events is studied in hadronic e^+e^- annihilation events at centre of mass energies between 22 and 56 GeV, using the data of the JADE, MARK-II and AMY collaborations at PETRA, PEP and TRISTAN. Three jet events are defined by a jet finding algorithm which is closely related to the definition of resolvable jets used in $O(\alpha_s^2)$ perturbative QCD calculations, where the relative production rate of 3-jet events is roughly proportional to the strong coupling strength, α_s. The observed production rates of 3-jet events decreases significantly with increasing centre of mass energy. The results, which are independent of fragmentation model calculations, can be directly compared to theoretically calculated jet production rates and are in good agreement with the QCD expectations of a running coupling strength, while the hypothesis of an energy independent coupling constant can be excluded with a significance of 5 standard deviations. Based on these results, the presented jet analysis also provides the possibility to detect first signs of the production of new and heavy particles in the early stage of data taking at SLC and LEP.

38427 (LPC—86-03) P/sub T/ and Q^2 dependence of multijet production in $\gamma\gamma^*$ collisions/sup +)/. Arteaga-Romero, N.; Carimalo, C.; Kessler, P. (College de France, 75 - Paris. Lab. de Physique Corpusculaire). Mar 1986. 23p. (CONF-8604238—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753487/JAW.

From 7. international workshop on photon-photon collisions; Paris, France (1 Apr 1986).

In the context of a measurement recently performed by the PLUTO Collaboration at PETRA, we have computed the contribution of 2-jet, 3-jet and 4-jet production processes (each involving 2 large-P/sub T/ jets) in $\gamma\gamma^*$ collisions to the differential cross section $d\delta(dp/sub\ T/dQ^2)$, where Q^2 is the γ^*'s four momentum squared. It results that the total correction to the 2-jet contribution ($\gamma\gamma^*$->qantiq), obtained for P/sub T/ and Q^2 values located in the range 2 GeV<P/sub T/<6 GeV and 0.1 GeV^2<Q^2<12 GeV^2 varies rather slowly as a function of those two parameters; it ranges between 30% and 70%. The specific contribution of the higher twist term involving the process $\gamma\gamma^*$->Mqantiq appears to be insignificant. The discrepancy observed between experiment and theory at $Q^2 < \sim 0.3$ GeV^2 and P/sub T/$\sim$=2 - 3.5 GeV is not explained by our results.

38428 (LYCEN—8721) Motion of a particle in a Coulomb plus Aharonov-Bohm potential. Kibler, M.; Negadi, T. (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire). May 1987. 12p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753489/JAW.

The motion of a particle in a Coulomb plus Aharonov-Bohm potential is investigated from a classical and a quantum mechanical viewpoint. The quantum bound states are derived by using the KS transformation. The grouping of certain levels is explained via the introduction of a SU(2) dynamical algebra. All classical finite trajectories are found to be periodic.

38429 (OUP—87-34) Comment on "Discrepancy between theory and experiment for λ e^+ -> $\lambda e^+\nu$: Possible evidence for a fourth generation". Hoegaasen, H.; Lie-Svendsen, Oe. (Oslo Univ. (Norway). Fysisk Inst.). Oct 1987. 6p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88752494/JAW.

A caluculation of the weak decay $\lambda c^+ \rightarrow \lambda e^+ \nu$ in the MIT bag model is presented. It is demonstrated that the result is compatible with observation.

38430 **(SLAC-PUB—4601) Theory of e⁺e/sup {minus}/ collisions at very high energy.** Peskin, M.E. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1988. Contract AC03-76SF00515. 45p. (CONF-870821—12). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010682/JAW.

From SLAC summer institute on particle physics: looking beyond the Z; Stanford, CA, USA (10 Aug 1987).

In these lectures, the array of new phenomena are reviewed which might be discovered in electron-positron reactions conducted at energies well above the Z{degree}. Before beginning a discussion of what new phenomena we might find, or how we might uncover them, the question is addressed of why such a program of research is important. The question of what we should be looking for, and what discoveries will be the most illuminating, as we search for the next layer of fundamental physics is argued. With this background, we can then discuss in some considerable detail the contributions that the study of electron-positron collisions at high energy can make in this search.

38431 **(SLAC-PUB—4604) B-factories.** Bloom, E.D. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Apr 1988. Contract AC03-76SF00515. 19p. (CONF-871071—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010678/JAW.

From 8. Vanderbilt high energy physics conference; Nashville, TN, USA (8 Oct 1987).

We briefly review the physics of CP violation and the interest of studying this phenomenon in the B-meson system. The need for very large numbers of B-decays is shown, and a number of approaches for B-factories are compared. In particular, e⁺e/sup {minus}/ linear and circular colliders are discussed in some detail, with specific examples presented. 31 refs., 22 figs., 5 tabs.

38432 **(TRI-PP—88-17) Relativistic treatment of mesonic contributions to quasielastic (e,e').** Blunden, P.G.; Butler, M.N. (TRIUMF, Vancouver, British Columbia (Canada)). Mar 1988. 7p. (CONF-880386—4). NTIS (US Sales Only), PC A02/MF A01;1; GPO Dep. Order Number DE88010868/JAW.

From International conference on spin-observables in nuclear physics; Telluride, CO, USA (14 Mar 1988).

A relativistic model with pseudovector pion coupling is used to study exchange current contributions, with emphasis on quasielastic kinematics, beginning with the Lagrangian for nucleons interacting with a scalar and vector meson. It is found that the effects of meson-exchange currents are more important in a relativistic model than in a non-relativistic one.

38433 **Left-right symmetry and neutrino masses in a nonperturbative unification framework.** Hung, P.Q.; Mohan, S. (Fermi National Accelerator Laboratory, Batavia, Illinois 60510). *Physical Review Letters;* **61**: No. 1, 31-34(4 Jul 1988).

Within the nonperturbative unification framework pioneered by Maiani, Parisi, and Petronzio, it is shown how the mass of the right-handed W boson can be determined just by knowledge of the values of $\sin^2\theta$/sub W/ and α_s (equivalentg$_s^2/4\pi$) at the Fermi scale Λ/sub F/$\simeq$250 GeV. It is found that M/sub W//sub >//sub R/ can be as low as 8 TeV and, as a consequence, it may be possible to detect W/sub R/ at the proposed Superconducting Super Collider. In the model considered here, light, Majorana neutrino masses are found to be small (<65 eV).

38434 **Measure of CP nonconservation and its consequence on the structure of the Kobayashi-Maskawa matrix.** Hamzaoui, C. (Department of Physics, The Rockefeller University, 1230 York Avenue, New York, New York 10021). *Physical Review Letters;* **61**: No. 1, 35-37(4 Jul 1988).

By use of unitarity of the Kobayashi-Maskawa matrix, the rephasing-invariant measure δ/sub KM/ of CP nonconservation is evaluated in terms of the modulus squared of four matrix elements, which are taken as the four independent parameters. The striking feature of such a formulation is that the positivity of δ/sub KM/^{2} gives both upper and lower bounds on the matrix elements chemical bondV/sub c//sub d/chemical bond, chemical bondV/sub c//sub s/chemical bond, chemical bondV/sub t//sub d/chemical bond, and chemical bondV/sub t//sub s/chemical bond.

38435 **Nonperturbative unification in the manner of Maiani, Parisi, and Petronzio at intermediate energies.** Hung, P.Q. (Fermi National Accelerator Laboratory, Post Office Box 500, Batavia, Illinois 60510). *Physical Review [Section] D: Particles and Fields;* **38**: No. 1, 377-382(1 Jul 1988).

A nonasymptotically free gauge theory with many couplings is shown to exhibit a "trapping" mechanism, in the sense that, as soon as one (or more) of the couplings grows large, the rest of the couplings will follow suit. This mechanism can help achieve a nonperturbative "unification" of the standard model in the manner of Maiani, Parisi, and Petronzio at relatively "low" energies (TeV scales). Two scenarios are given, one of which is just the standard SU(3)/sub c/ x SU(2)/sub L/ x U(1)/sub y/ and the other one involves, in addition, technicolor interactions. Predictions for $\sin^2\theta$/sub w/(Λ/sub F/$\simeq$250 GeV) and $\alpha_s(\Lambda$/sub F/) are presented for both scenarios. Both scenarios make use of SU(2)/sub L/-singlet heavy fermions which carry charge, color (model I), and technicolor (model II). Some experimental implications are also discussed.

38436 **Relativistic theory of the decay of upsilon into Higgs boson + photon.** Faeldt, G.; Osland, P.; Wu, T.T. (Gustaf Werners Institut, Box 531, S-751 21 Uppsala, Sweden). *Physical Review [Section] D: Particles and Fields;* **38**: No. 1, 164-213(1 Jul 1988).

We present a technique for calculating the decay rate for quarkonium→Higgs boson+photon. It is applied to upsilon decay into a Higgs boson of mass in the range 7—9 GeV. Relativistic effects are accounted for by employing Bethe-Salpeter equations to determine the Ybb-bar and Hbb-bar vertex functions. The decay rate is controlled by two amplitudes that interfere destructively. It is found that the ratio $\Gamma(\Upsilon\rightarrow H\gamma)/\Gamma(\Upsilon\rightarrow\mu^+\mu^-)$ is substantially smaller than that of nonrelativistic calculations.

38437 **Radiative-induced fermion masses.** Chang, D.; Liu, J. (Department of Physics and Astronomy, Northwestern University, Evanston, Illinois 60208). *Physical Review [Section] D: Particles and Fields;* **38**: No. 1, 327-331(1 Jul 1988).

Gauge models in which fermion masses are generated radiatively are discussed. Conditions under which it may be achieved naturally are presented. An example of such models is illustrated in the context of SU(2)/sub L/ x SU(2)/sub R/ x U(1) gauge theory.

38438 **Cosmic-ray neutrinos in the atmosphere.** Gaisser, T.K.; Stanev, T.; Barr, G. (Bartol Research Institute, University of Delaware, Newark, Delaware 19716). *Physical Review [Section] D: Particles and Fields;* **38**: No. 1, 85-95(1 Jul 1988).

In this paper we give a complete account of detailed calculations of the flux of neutrinos of atmospheric origin that we have made for detectors at various locations on the globe. The emphasis here is on neutrinos in the energy range around 1 GeV, and we compare the results with recent measurements made with larger underground detectors. A detailed knowledge of the atmospheric cosmic-ray neutrino flux is a prerequisite for evaluating the background for the search for nucleon decay as well as the background for neutrinos of extraterrestrial origin.

38439 **W^+W^- pair production at resonances in the SU(2)/sub L/ x SU(2)/sub R/ x U(1) model.** Rajpoot, S.; Samuel, M. (Department of Physics, Oklahoma State University, Stillwater, Oklahoma 74078). *Physical Review [Section] D: Particles and Fields;* **38**: No. 1, 391-393(1 Jul 1988).

Consistent with all neutral-current data, the mass of the second neutral gauge boson of the SU(2)/sub L/ x SU(2)/sub R/ x U(1) electroweak interaction model can be as low as 240 GeV. It is shown that if the second neutral boson mass turns out to be in the 1-TeV range, its production and subsequent decay at resonance offers the exciting possibility of copiously pair producing the

charged weak gauge bosons of the standard SU(2)/sub L/ x U(1) model.

38440 Stochastical dynamics and charge conservation in hadronization. Shih, C.C.; Carruthers, P. (Department of Physics and Astronomy, University of Tennessee, Knoxville, Tennessee 37996-1200). *Physical Review* [*Section*] *D: Particles and Fields;* **38**: No. 1, 56-63(1 Jul 1988).

Stochasticity in multiplicity distribution of total inelastic hadronic distributions is investigated in conjunction with the requirement of charge conservation. We obtain, for the simplest quantum-mechanical systems, neutral cluster states or partially coherent charged states. While neutral cluster states lead to negative-binomial distributions, partially coherent charge states lead to distributions very similar to the ordinary partially coherent states. Charge-compensation mechanisms are very different for these extremes. In terms of neutral clusters, the hadron multiplicity fluctuation is too large for e^+e^- systems, but is compatible to hadron-hadron systems at high energies. In terms of partially coherent charge distributions, the ratio of coherence to chaos is large for the e^+e^- systems and rather small for the hadron-hadron systems, similar to the conclusion obtained through the partially coherent laser distributions. Simple consequences of charge correlations and compensation in a restricted region of the phase space is also investigated.

38441 High-energy nucleon-nucleus scattering and cosmic-ray cross sections. Durand, L.; Pi, H. (Department of Physics, University of Wisconsin—Madison, Madison, Wisconsin 53706). *Physical Review* [*Section*] *D: Particles and Fields;* **38**: No. 1, 78-84(1 Jul 1988).

We develop a QCD-based diffractive model for nucleon-nucleon and nucleon-nucleus cross sections in which the increase in the cross sections at high energies is driven by semihard parton-parton scattering. We use the model to calculate the absorptive cross section for protons on air at very high energies, and find excellent agreement with data from cosmic-ray experiments. The results can be used to extract σ/sub tot/(pp) from σ/sub abs/(p-air) in a way which is nearly independent of the input parameters. We include an approximate treatment of single-diffractive pp scattering.

38442 Nonlinear effects in the flux-tube model for ultrarelativistic nucleus-nucleus collisions. Gatoff, G.; Kerman, A.K.; Vautherin, D. (Center for Theoretical Physics, Laboratory for Nuclear Science dge, Massachusetts 02139). *Physical Review* [*Section*] *D: Particles and Fields;* **38**: No. 1, 96-104(1 Jul 1988).

We solve the classical Yang-Mills equations numerically for the evolution of the color fields in the flux-tube model for ultrarelativistic collisions. We show that nonlinear effects are small and decrease as the nuclei recede. This result can be understood in the limit of large background fields from an analytic study of the linearized equations.

38443 Interference effects and the longitudinal fraction in the process gg→ZZ. Dicus, D.A. (Center for Particle Theory, University of Texas, Austin, Texas 78712). *Physical Review* [*Section*] *D: Particles and Fields;* **38**: No. 1, 394-397(1 Jul 1988).

The contribution to pp→ZZ+X from gluon fusion (gg→ZZ) is determined and combined with the contributions from the subprocesses qq-bar→ZZ, WW→ZZ, and ZZ→ZZ to find the total Higgs-boson signal in ZZ production and the fraction of events where the Z's are longitudinal.

38444 Graphic evidence for non-Abelian flux tubes. Caldi, D.G.; Sterling, T. (Department of Physics, University of Connecticut, Storrs, Connecticut 06268). *Physical Review Letters;* **60**: No. 24, 2454-2457(13 Jun 1988).

From Monte Carlo calculations of plaquette—Wilson-loop correlations for three-dimensional SU(2) lattice gauge theory, we give unambiguous graphic demonstrations of the formation of non-Abelian chromoelectric flux tubes with constant energy density in the region between a pair of static qq-bar sources.

38445 Average temperature and multiplicities of e^+e^- annihilation. Hoang, T.F.; Cork, B. (Lawrence Berkeley Lab., CA (USA)). *Zeitschrift fuer Physik* [*Sektion*] *C: Particles and Fields;* **38**: No. 4, 603-607(May 1988). Contract AC03-76SF00098.

Hadron temperatures of e^+e^- -> hanti h from PEP experiments at 29 GeV are estimated using the P/sub perpendicular/ /sub to/ distribution: rather small fluctuations are found for temperatures of π, K, ..., γ with respect to the average anti T = 196+-7 MeV. A semi-empirical formula including quark content of h is proposed to account for multiplicities of π, K, ..., Ω in terms of a unique temperature anti T. The formula is further extended to charmed particles D, F, Jpsi and Λ/sub c/ without free parameters. The property anti T proportional to E/sub cm/^{1}4 holds for other experiments of DESY and CESR.

38446 Phenomenology and conformal field theory or can string theory predict the weak mixing angle?. Banks, T.; Dixon, L.J.; Friedan, D.; Martinec, E. (California Univ., Santa Cruz (USA). Inst. for Particle Physics; California Univ., Santa Cruz (USA). Dept. of Physics; Stanford Linear Accelerator Center, CA (USA); Chicago Univ., IL (USA). Enrico Fermi Inst.; Chicago Univ., IL (USA). Dept. of Physics). *Nuclear Physics* [*Section*] *B;* **299**: No. 3, 613-626(11 Apr 1988). Contract AC03-76SF00515;AM03-76SF00010;FG02-84ER45144;AC02-80ER10587.

We show that the weak mixing angle Θ/sub w/ is the same for continuously connected classical vacua of the beterotic string which have chiral fermions in their massless spectra. We also show that the world-sheet quantum field theory for any classical vacuum with spacetime supersymmetry possesses an N=2 superconformal invariance.

38447 Planar and non-planar Wilson loops in QCD. Bagan, E.; Latorre, J.I. (Brookhaven National Lab., Upton, NY (USA). Physics Dept.; Massachusetts Inst. of Tech., Cambridge (USA). Center for Theoretical Physics; Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Physics). *Nuclear Physics* [*Section*] *B;* **298**: No. 3, 613-635(14 Mar 1988). Contract AC02-76ER03069;AC02-76CH00016.

A general QCD sum rule calculation of vacuum expectation values of Wilson loops is presented and particularized to several specific planar and non-planar contours. The string tension obtained is $\sqrt{\sigma}$ = 0.50(5) GeV. Within the errors of the approach, this result is shape-independent. We comment on the possibility that corrections to the area and perimeter laws could be parametrized by a geodesic curvature term.

38448 Probing lepton structure at the SSC. Chivukula, R.S.; Randall, L. (Boston Univ., MA (USA). Dept. of Physics; Lawrence Berkeley Lab., CA (USA)). *Physics Letters* [*Section*] *B;* **202**: No. 3, 429-435(10 Mar 1988). Contract AC03-76SF00098;AC02-86ER40284.

If quarks and leptons are composite objects with common constituents, then there exist two-quark-two-lepton contact interactions which could affect lepton pair production at the SSC. We show that for a range of compositeness scales and lepton pair invariant masses, the contact interaction contributions dominate the standard model contributions to the cross section. In this regime, we show that there should be a measurable and statistically significant front-back asymmetry.

38449 Technichiral color and the generation structure. Kuo, W.C.; Slaven, D.; Young, B.L. (Ames Lab., IA (USA); Iowa State Univ. of Science and Technology, Ames (USA). Dept. of Physics). *Physics Letters* [*Section*] *B;* **202**: No. 3, 353-357(10 Mar 1988). Contract W-7405-ENG-82.

We generalize a recently proposed chiral color model to a technicolor theory. This generalization has two interesting features: (a) The generation number of the ordinary quarks is determined by the technicolor group structure. (b) The technifermion condensates break both the chiral color and the electroweak symmetries. We also consider cases of slowly running coupling for the technicolor interaction.

38450 **Baryon masses in the bound state approach to strangeness in the Skyrme model.** Callan, C.G.; Hornbostel, K.; Klebanov, I. (Princeton Univ., NJ (USA). Joseph Henry Labs.; Stanford Linear Accelerator Center, CA (USA)). *Physics Letters* [*Section*] *B;* **202**: No. 2, 269-275(3 Mar 1988). Contract AC03-76SF00515;AC02-76ER03072.

We diagonalize exactly the O(N/sub c/°) hamiltonian relevant to the bound state approach to strangeness in the Skyrme model. The hyperfine splittings of strange baryons computed within this framework agree well with the experimental values.

38451 **Weak radiative B-meson decay as a probe of the Higgs sector.** Grinstein, B.; Wise, M.B. (Lawrence Berkeley Lab., CA (USA); California Inst. of Tech., Pasadena (USA);). *Physics Letters* [*Section*] *B;* **201**: No. 2, 274-278(4 Feb 1988). Contract AC03-76SF00098;AC03-81ER40050;FG03-84ER40172.

We examine the rate for B-meson decay to a hard photon and strange hadronic final states (i.e., B -> γX/sub s/, X/sub s/ = K/sup */, etc) in extension of the standard model with two Higgs doublets and no tree-level flavor-changing neutral Higgs-boson couplings. In such models the rate for B -> γX/sub s/ can differ dramatically from what it is in the standard model.

38452 **Tadpole in the chiral Lagrangian of K decays.** Leurer, M. (Lawrence Berkeley Lab., CA (USA);). *Physics Letters* [*Section*] *B;* **201**: No. 1, 128-132(28 Jan 1988). Contract AC03-76SF00098.

We prove that when the chiral lagrangian is expanded to first order in G/sub F/ and to any finite order in meson masses and momenta the tadpole can be completely rotated away, namely: the tadpole is not physically observable.

38453 **Gluon propagator at finite temperature.** Mandula, J.E.; Ogilvie, M. (USDOE, Washington, DC; Washington Univ., St. Louis, MO (USA). Dept. of Physics; Brookhaven National Lab., Upton, NY (USA);). *Physics Letters* [*Section*] *B;* **201**: No. 1, 117-122(28 Jan 1988). Contract AC02-76CH00016.

The Landau gauge gluon propagator at finite temperature above and below the deconfinement transition is measured using lattice Monte Carlo simulation. The color electric and magnetic masses are determined. The most striking result of the calculation is that the time component of the gluon field appears to acquire a vacuum expected value in the deconfined region.

38454 **Summary of tritium beta spectrum studies.** Roberston, R.G.H. (Los Alamos National Lab., NM (USA)). pp 2 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Neutrinos were created in vast numbers during the big bang and now fill the universe. They so outnumber nucleons that if they have even a tiny mass, about 10^{-4} of the electron mass, they would dominate the mass of the universe and prevent it from expanding indefinitely. In 1980 a Russian experimental team studying the beta decay of tritium reported that the electron (anti)neutrino had a mass of 35 eV, just about right to close the universe. Many groups around the world set out to check this result, and some new data are now available. They will report on the new results from ITEP (Moscow), Zurich, Los Alamos, Tokyo, and elsewhere.

38455 **Color response and color transport in a quark-gluon plasma.** Heinz, U. (Physics Dept., Brookhaven National Lab., Upton, NY 11973 (US)). pp 466-484 of Hadronic matter in collision: Proceedings of the second international workshop on local equilibrium in strong interaction physics. Carruthers, P.; Strottman, D. Teaneck, NJ; World Scientific Pub. Co. (1986). (CONF-860440—). Contract AC02-76CH00016.

From 2. international workshop on local equilibrium in strong interaction physics: hadronic matter in collision; Santa Fe, NM, USA (9 Apr 1986).

Using color kinetic theory, the authors discuss color conduction and color response in a quark-gluon plasma. Collective color oscillations and their damping rates are investigated. An instability of the thermal equilibrium state in high T QCD is discovered.

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

Using the concept of group contractions we discuss the implications of the RPA for the dynamical group as well as symmetry groups of finite boson systems. In particular it is shown that if the Hartree-Bose ground-state breaks the symmetry, the RPA contracts

the symmetry group onto a non-semisimple group which is a symmetry group of the RPA Hamiltonian. This group contains all subgroups of the original symmetry group which are not broken by the ground-state. The abelian invariant subalgebra of the contracted algebra contains the excitation operators of the spurious modes.

38463 Construction of classical Virasoro algebras as SU(1,1) extensions. Fairlie, D.B.; Nuyts, J.; Zachos, C.K. (Durham Univ. (UK). Dept. of Mathematics; Mons Univ. (Belgium). Dept. de Physique; Argonne National Lab., IL (USA). High Energy Physics Div.). *Physics Letters [Section] B;* 202: No. 3, 320-324(10 Mar 1988). Contract W-31-109-ENG-38.

The generators of SU(1,1) and their Casimir invariant may be arrayed in a compact formula to construct all generators of the centreless Virasoro algebra which includes this SU(1,1) subalgebra. We illustrate properties of our construction through a simple differential operator realization of these algebras and comment on its usefulness.

38464 Dynamical symmetry breaking, axion dynamics and instanton-induced second-class tau-decays. White, A.R. (High Energy Physics Div., Argonne National Lab., Argonne, IL (US)). *Modern Physics Letters A;* 2: No. 12, 945-956(Dec 1987). Contract W-31-109-ENG-38.

Small color instantons, which have been proposed as a mechanism to raise the axion mass, may also produce a large rate for the second-class tau-decay mode tau $\rightarrow \pi\eta\alpha\nu$. The growth of the QCD coupling and large anomalous dimension scaling properties needed are natural consequences of dynamical electroweak symmetry breaking by color sextet quarks.

38465 The phenomenological analysis of hadronic multiplicity distributions. Carruthers, P.; Shih, C.C. (Dept. of Physics, Univ. of Arizona, Tucson, AZ 85721 (US)). *International Journal of Modern Physics A;* 2: No. 5, 1447-1548(Oct 1987).

The aims of the present paper are limited to a description of theoretical and phenomenological techniques which are, as far as possible, model independent, or at least valid for a class of models. It is the authors' experience that most of the gross measures of particle reaction data (e.g. total cross sections, inclusive distributions, KNO "plots," etc.) do not discriminate among models unless supplemented with more fine grained information, especially correlations of various kinds. In the absence of a quantitative theory for the exclusive matrix elements, from which all else follows, it seems more constructive to work from the outside to the inside. (An especially powerful tool for this is intensity interferometry, much used in the statistical theory of optics but as yet rather undeveloped for the analysis of elementary particle data.) Whenever possible we emphasize the statistical essence of an observable, which can be rather independent of the particular dynamical process. A familiar example is the Maxwellian energy distribution of gas molecules in thermal equilibrium, whose form (as does the validity of hydrodynamic equations for the system) is independent of the detailed force law. This example illustrates both the strength and weakness of the approach.

38466 From baryon number generation to the quark-hadron phase transition. Snyderman, N.J. (Lawrence Livermore National Lab., CA (USA)). pp 1 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-48.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Between the temperature scale at which baryon number was generated and the temperature at which baryons and mesons formed, there were phase transitions associated with the Weinberg-Salam symmetry breaking, and perhaps with Pecci-Quinn symmetry breaking and supersymmetry breaking. Also, the quark-hadron phase transition may have taken place in the presence of cosmic strings. Some possible consequences of these phase transitions and degrees of freedom on the quark-hadron phase transition will be discussed.

38467 Quark-hadron phase transition and primordial baryon diffusion. Fuller, G.M.; Mathews, G.J.; Alcock, C. (Lawrence Livermore National Lab., CA (USA)). pp 1 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract W-7405-ENG-48.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

The authors compute the maximum amplitude for isothermal baryon number density fluctuations to emerge from the quark-hadron phase transition and their effects on primordial nucleosynthesis, as a function of the coexistence temperature and the fractional volume of the universe which will remain in quark-gluon plasma when the release of latent heat no longer compensates the cooling due to expansion. In a universe with Omega = 1 in baryons, they find that ^{4}He, ^{3}He, and deuterium are within observed constraints for a large part of the parameter space. However, ^{7}Li is overproduced. They find only a very small abundance of elements heavier than mass 11 (total mass fraction $X \leqq 10^{-8}$).

38468 (CEA-CONF—9313) Scattering and short-distance properties in field theory models. Iagolnitzer, D. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Theorique). 1987. 12p. (CONF-8709280—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753472/JAW.

From Conference on mathematical quantum field theory and related topics; Montreal, Canada (1 Sep 1987).

The aim of constructive field theory is not only to define models but also to establish their general properties of physical interest. We here review recent works on scattering and on short-distance properties for weakly coupled theories with mass gap such as typically P(phi) in dimension 2, phi^4 in dimension 3 and the (renormalizable, asymptotically free) massive Gross-Neveu (GN) model in dimension 2. Many of the ideas would apply similarly to other (possibly non renormalizable) theories that might be defined in a similar way via phase-space analysis.

38469 (DOE/ER/40125—14) Theoretical particle physics: Technical progress report. Gottlieb, S.A. (Indiana Univ., Bloomington (USA). Dept. of Physics). May 1988. Contract AC02-84ER40125. 42p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011499/JAW.

Research in lattice gauge theory during the past year is described. Several projects were completed dealing with QCD simulations including dynamical fermions. A study of the spectrum of QCD was combined with a study of the finite temperature chiral symmetry restoration transition in order to determine the transition temperature in MeV. The transition temperature is seen to be ~ 130 MeV, which makes it more accessible to observation at a relativistic heavy-ion collider than previously expected. Studies of hadronic screening lengths and the quark number susceptibility at zero chemical potential provide further probes of the high temperature phase of QCD. Work has continued on algorithm development with the publication of one paper on systematic errors as a function of step size and conjugate gradient residual, and work in progress on fermion matrix preconditioning and global accept-reject algorithms.

38470 (DOE/ER/40125—15) Theoretical particle physics: Technical progress report, May 1987-May 1988. Hendry, A.W.; Kostelecky, V.A.; Lichtenberg, D.B. (USDOE, Washington, DC; Indiana Univ., Bloomington (USA)). May 1988. Contract AC02-84ER40125. 42p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011809/JAW.

This Technical Progress Report outlines the research of the Task B High Energy Theory Group at Indiana University during 1987-88. We have been active in a variety of

areas{emdash}superstrings, lattice gauge theory, quarkonium and neutrino physics. The following pages provide brief summaries of the progress we were able to make in these areas during the past year. In superstring theory, rules were developed for calculating string amplitudes to the one loop level for a wide variety of topologies; the stability of the string vacuum was investiagted for bosonic strings. We continued our mathematical studies of supergroups. In lattice gauge theory, we have been particularly interested in calculating, from first principles, QCD effects on weak interaction processes (of special interest here is the search for a better understanding of the mysterious {DELTA}I = {1/2} rule). At the same time, we have been trying to develop more efficient algorithms to reduce the amount of computing necessary in lattice calculations. In more phenomenological work, we have been studying various aspects of bound quark-antiquark systems, including a new wave equation which incorporates relativitic kinematics. We have also been trying to find ways of experimentally distinguishing between Dirac and Majorana neutrinos.

38471 **(DOE/ER/40272—51) Calculations in perturbative string field theory.** Thorn, C.B. (Florida Univ., Gainesville (USA). Dept. of Physics). 1987. Contract FG05-86ER40272. 15p. (CONF-8710282—1; UFTP—87-23). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011616/JAW.

From Conference on perspectives in string theory; Copenhagen, Denmark (12 Oct 1987).

The author discusses methods for evaluating the Feynman diagrams of string field theory, with particular emphasis on Witten's version of open string field theory. It is explained in some detail how the rules states by Giddings and Martinec for relating a given diagram to a Polyakov path integral emerge from the Feynman rules.

From 3. workshop on statistical mechanics and field theory; Sao Carlos, Brazil (11 Dec 1985).

38479 (INIS-mf—11219, pp 27-35) **Soft gluon distribution in QCD.** Malaza, E.D. (Institute of Theoretical Physics and Astrophysics, University of Cape Town, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

The distribution of soft gluons resulting from a system of hard partons is studied to all orders of perturbative QCD. With the hard partons produced from a source at mass scale Q^2, perturbative predictions are made in terms of the expansion parameter $\sqrt{\alpha}$/sub S/(Q^2), which is small in the limit Q^2 -> infinity.

38480 (INIS-mf—11219, pp 37-47) **Cavity quantum chromodynamics to order α/sub S/².** Stoddart, A.J.; Viollier, R.D. (Institute of Theoretical Physics and Astrophysics, University of Cape Town, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

Based on perturbative QCD in a cavity, we have calculated, for the two-quark and quark-antiquark systems, all non-diverging graphs to order α/sub S/² which do not involve additional quark-antiquark pairs in the intermediate states. Using the two-body interactions that include the two-gluon exchange and annihilation graphs, we obtain in a satisfactory fit to the low-energy spectrum of hadrons consisting of massless quarks and anti-quarks, in particular the splitting of the masses of the π- and eta-mesons.

38481 (INIS-mf—11219, pp 49-59) **On the deconfinement and chiral symmetry restoration transitions in quantum chromodynamics.** Cleymans, J. (Institute of Theoretical Physics and Astrophysics, University of Cape Town, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

This paper starts with a brief historical introduction after which QCD at finite temperatures will be presented and a simple model for the possible phase structure of QCD will be discussed.

38482 (INIS-mf—11219, pp 73-80) **EMC effect in the small x region.** Nakano, K. (Institute of Theoretical Physics and Astrophysics, University of Cape Town, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

The method of equivalent particle approximation of virtual photons is applied to explain the small x behavior of the EMC effect by incorporating the q-anti-q component of virtual photons. The quark nucleon interaction is estimated by the additive quark model. The nuclear effect is accounted for by considering the probability for the quark propagation through the nuclear medium.

38483 (INIS-mf—11219, pp 81-90) **Electromagnetic neutron structure function.** Nakano, A. (Institute of Theoretical Physics and Astrophysics, University of Cape Town, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

A preliminary result for the electromagnetic neutron structure function via the quark parton model is presented, i.e. without resorting to some functional parametrisation. Only the data on the hydrogen target are used through (μ p), (ν p) and (anti ν p) experiments.

38484 (INIS-mf—11219, pp 91-120) **Nucleon-antinucleon annihilation.** Tegen, R. (Institute of Theoretical Physics and Astrophysics, University of Cape Town, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

Recent relativistic quark-gluon approaches to the understanding of the nucleon-antinucleon annihilation are reviewed. Implications for a better understanding of the short-distance nucleon-nucleon interaction are pointed out. New precise data on the p anti p elastic and charge exchange reaction at the same energies also allow for an independent constraint on both the annihilation range and strength. Both these model parameters are found to be reasonable (quark core size of 0.60 fm and annihilation strength $\sim$ - 2 GeV). We also discuss two unexpected p anti p experimental results (the 'πp puzzle' and the backward rise of the differential cross-section for N anti N->K anti K) which both sensitively depend on the detailed quark dynamics of the annihilation process.

38485 (INIS-mf—11223, pp 221-229) **Nonlocal conformal light-cone expansion in QCD.** Geyer, B.; Robaschik, D.; Horejsi, J. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Sektion Physik; Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

A new variant of the nonlocal light-cone expansion in QCD is proposed. The anomalous dimension of the corresponding fermion flavour non-singlet operator is calculated in the one-loop approximation and shown to coincide with the Brodsky-Lepage kernel. The connection of our approach with the standard local conformal light-cone dominated process is considered within the framework of our formalism. The evolution equation obtained earlier by different methods is recovered in a particularly straightforward and compact manner. 11 refs.

38486 (INIS-mf—11223, pp 399-419) **Nonperturbative quantum gauge theories.** Kerler, W. (Marburg Univ. (Germany, F.R.). Fachbereich 13 Physik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

A nonperturbative renormalization procedure is presented. The form to be used for the lattice theory is specified and the aspects of gauge-invariant quantization are discussed. The limit (general nonperturbative renormalization) is defined and the conditions for its existence are given. The various differences to other approaches, in particular to perturbative QFT and to block-spin procedures from statistical mechanics, are discussed. The present knowledge about the parameter singularities in theories of interest is summarized and an outlook on necessary future investigations is given. 26 refs. (M.F.W.).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The comments on the infrared divergences in QED are presented. 6 refs. (M.F.W.).

38488 (INIS-mf—11223, pp 443-453) **Vacuum problem in the Schwinger model.** Ilieva, N.P. (Joint Inst. for Nuclear Research, Dubna (USSR)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The Schwinger model with quantum motions of bosonic and fermionic vacua is considered. The physical vacuum is defined as a coherent state of the observable fields. Quark-condensates values are found, which depend on the gauge field topological degeneration parameter. 10 refs.

38489 (INIS-mf—11223, pp 455-466) **1+1 dimensional N=1 Wess-Zumino model on the lattice in the local Hamiltonian Monte Carlo method.** Schiller, A. (Karl-Marx-Universitaet, Leipzig (German Democratic Republic). Sektion Physik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Based on a restricted supersymmetry algebra the lattice N=1 Wess-Zumino model in 1+1 dimensions is formulated in such a way that it can be investigated within the local Hamiltonian Monte Carlo method. I find a pattern of supersymmetry breaking which closely follows the expectations of Bartels and Bronzan in an alternative lattice formulation. Supersymmetric solitons with half-integral fermionic charge are observed which are not responsible for the supersymmetry breaking. 13 refs., 3 figs.

38490 (INIS-mf—11223, pp 467-484) **Quarks and gluons at finite temperature and density.** Nakamura, Atsushi. (Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study; Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

I have run computer simulation in SU(2) lattice gauge theory on 8^3 x 2 lattice including dynamical quark loops. No rapid variation is observed in the value of Polyakov line, while the energy densities of quark and gluon show strong indication of a second order phase transition around T $\simeq$ 250 MeV. In order to reduce finite size effects,the results are compared with those of free gas on a lattice of the same size. The quark and gluon energy densities overshoot the free gas values at high temperature. The effects of chemical potential are also studied. The behaviour of the energy densities and the number densities are far from a free gas case. 21 refs., 5 figs.

38491 (INIS-mf—11223, pp 485-494) **Canonical quantization of the periodic Liouville string field theory.** Otto, H.J.; Weigt, G. (Humboldt-Universitaet, Berlin (German Democratic Republic). Sektion Physik; Akademie der Wissenschaften der DDR, Berlin-Zeuthen. Inst. fuer Hochenergiephysik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The operator for the periodic Liouville field is given by a canonical transformation on a periodic scalar free field. Necessary quantum corrections of the Liouville operator with respect to its classical expression are fixed by locality and conformal transformation properties. 6 refs.

38492 **(ITEP—50(1987)) Physical vertexes of the bosonic string and the operator product expansion.** Gogolev, A.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Teoreticheskoj i Ehksperimental'noj Fiziki). 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702889/JAW.

The meaning of elimination of spurious states from the full set of operators at the content of the operator product expansion is considered. It is demonstrated explicitely that the unphysical states have no meaning when the scattering amplitude of the theory is interested and that the projective invariance is valid only on physical states. 3 refs.

38493 **(ITF—86-126) Conformally covariant operators and effective action in external gravitational field.** Gusynin, V.P.; Roman'kov, V.V. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 15p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702895/JAW.

The n-dimensional expressions for the second order conformally covariant differentional operators acting on vector and tensor fields and for the fourth order conformally covariant operator acting on scalar fields are obtained. For the fourth order operator one-loop effective action is evaluated in four dimensions. The possibility of effective action evaluation for other conformally covariant operators is discussed. 15 refs.

38494 **(ITF—86-150) On the electron charge fractionization in magnetic field with boundaries present.** Sitenko, Yu.A. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 20p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702896/JAW.

The influence of boundaries on the electron charge fractionization in external static field is investigated. The expression for vacuum charges induced in two-dimensional regions in the form of strips with finite and infinite length are obtained. 18 refs.

38495 **(JINR-E—2-87-16) Finiteness of nonlinear sigma-models on Ricci-Flat manifolds.** Kazakov, D.I. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702905/JAW.

Submitted to the journal Phys. Lett., B.

It is shown that nonlinear sigma-models can be made finite in 2-2 is an element of dimensions if the background bare metric is chosen to be g/sub ij/(phi)=Σ g/sub ij//sup (k)/ is an element of/ sup k/, where g/sub ij//sup (0)/ is Ricci-flat. This means that despite the appearance of non-zero β-functions in the standard approach, we can construct conformally invariant sigma-models with Ricci-flat metric. Thus the superstring compactification on Calabi-Yau manifolds becomes possible. 10 refs.

38496 **(JINR-E—2-87-588) Minimal quantization of two-dimensional models with chiral anomalies.** Ilieva, N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 14p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702910/JAW.

Submitted to the journal Intern. J. Modern Phys. .

Two-dimensional gauge models with chiral anomalies - "left-handed" QED and the chiral Schwinger model, are quantized consistently in the frames of the minimal quantization method. The choice of the cone time as a physical time for system of quantization is motivated. The well-known mass spectrum is found but with a fixed value of the regularization parameter a=2. Such a unique solution is obtained due to the strong requirement of consistency of the minimal quantization that reflects in the physically motivated choice of the time axis. 13 refs.; 2 figs.

38497 **(JINR-R—2-87-386) Euclidean measure for the electromagnetic field.** Loeffelholz, J. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 16p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702926/JAW.

A rigorous Euclidean approach to the quantization of the electromagnetic field F/sub ij/(x), x=(t, x) is not an element of R^4 is given, which we consider as a family of coordinates on some probability space (Ω, Σ, μ). Our main result is the construction of an isomorphism $\Sigma I \sim \sigma(2UB^0)$, where the ideal I corresponds to Faraday's law and 2, B^0 are σ-subalgebras. In particular, the restriction μB-vector^0 appears to be part space measure for a Markov process t is not an element of R -> B/sub ij/ (t,x). Using a Feynman-Kac formula the photon propagator is derived. 16 refs.; 2 figs.

38498 **(LBL—24883) Beyond the supersymmetric standard model.** Hall, L.J. (Lawrence Berkeley Lab., CA (USA)). Feb 1988. Contract AC03-76SF00098. 26p. (CONF-8707163—1; UCB-PTH—88/3; CONF-8707163—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010775/JAW.

From TASI School; Santa Fe, NM, USA (27 Jul 1987).

The possibility of baryon number violation at the weak scale and an alternative primordial nucleosynthesis scheme arising from the decay of gravitations are discussed. The minimal low energy supergravity model is defined and a few of its features are described. Renormalization group scaling and flavor physics are mentioned.

38499 **(RAL—87-115) Proceedings of the school for young high energy physicists, Rutherford Appleton Laboratory, September 8-20 1986.** Dainton, J.B. (ed.). (Rutherford Appleton Lab., Chilton (UK)). [1987]. 231p. (CONF-8609425—). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753518/JAW.

38500 (RAL—87-115, pp 1-39) **Introduction to quantum electrodynamics.** Webber, B.R. (Cambridge Univ. (UK)). [1987]. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753518/JAW. (CONF-8609425—).

From School for young high energy physicists; Chilton, UK (8 Sep 1986).

The aim of the lectures was to introduce techniques for performing simple calculations in quantum electrodynamics. Topics discussed in the lecture course included: the Klein-Gordon equation, Dirac equation and scattering amplitudes. (U.K.).

38501 (RAL—87-115, pp 77-156) **Quantum field theory, symmetries and gauge theories.** Aitchison, I.J.R. (Oxford Univ. (UK)). [1987]. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753518/JAW. (CONF-8609425—).

From School for young high energy physicists; Chilton, UK (8 Sep 1986).

The lecture course was divided into eight topics, and included: the quantum field, the Lagrange-Hamilton formulation relativity, massive particles and fermions, interactions in quantum field theory, symmetries in quantum field theory, and the GSW electroweak theory. (U.K.).

38502 (RAL—87-115, pp 41-76) **Introduction to quantum chromodynamics.** Irving, A.C. (Liverpool Univ. (UK)). [1987]. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753518/JAW. (CONF-8609425—).

From School for young high energy physicists; Chilton, UK (8 Sep 1986).

The lecture course was divided into six topics which included: renormalisation of scalar quantum field theory, QCD - an asymptotically free theories deep inelastic scattering at 0th order in QCD: the parton model, QCD corrections to scaling, JET production and non-perturbative QCD. (U.K.).

38503 **(TRI-PP—88-9) An overview of lattice QCD.** Woloshyn, R.M. (TRIUMF, Vancouver, British Columbia (Canada)). Mar 1988. 16p. (CONF-880331—3). NTIS (US Sales Only), PC A03/MF A01;1; GPO Dep. Order Number DE88010867/JAW.

From 3. Lake Louise Winter Institute on quantum chromodynamics: theory and experiment; Lake Louise, Canada (6 Mar 1988).

The basic concepts of the Lagrangian formulation of lattice field theory are discussed. The Wilson and staggered schemes for dealing with fermions on the lattice are described. Some recent results for hadron masses and vector and axial vector current matrix elements in lattice QCD are reviewed. 118 refs., 16 figs.

38504 **Finite-size effect in the Schwinger particle-production mechanism.** Wang, R.; Wong, C. (Oak Ridge National Laboratory and Joint Institute for Heavy-Ion Research, Oak Ridge, Tennessee 37831). *Physical Review [Section] D: Particles and Fields;* **38**: No. 1, 348-359(1 Jul 1988).

The Schwinger mechanism of particle production in a strong and uniform electric field for an infinite system is generalized to the case where the strong field is confined between two condenser plates separated by a finite distance. The production rates, for both bosons and fermions, are obtained by solving the Klein-Gordon equation and the Dirac equation in a linear vector potential. They are expressed in terms of parabolic cylinder functions for bosons, and in terms of the confluent hypergeometric functions for fermions. Numerical evaluation of these results shows large deviations of the production rate from what one deduces with the Schwinger formula, indicating a large finite-size effect in particle production.

38505 **Resource Letter: GI-1 Gauge invariance.** Cheng, T.P.; Li, L. (Department of Physics, University of Missouri, St. Louis, Missouri 63121 and School of Natural Sciences, Institute for Advanced Study, Princeton, New Jersey 08540). *American Journal of Physics;* **56**: No. 7, 586-600(Jul 1988).

Gauge symmetry has become one of the most basic concepts in the theoretical framework for understanding fundamental interactions: The quantum field theories of the strong, weak, and electromagnetic interactions are all gauge invariant; general relativity can also be viewed as a classical gauge theory. This Resource Letter is intended for nonspecialists who wish to study gauge theories and their applications to elementary particle physics. About half of our discussion is devoted to the general properties of gauge-invariant quantum field theories and half to their applications, from QED, QCD, and the Weinberg—Salam model to grand unification. The letter E after an item indicates elementary level or material of general interest to persons becoming informed in the field. The letter I, for intermediate level, indicates material of somewhat more specialized nature; and the letter A indicates rather specialized or advanced material. An asterisk (*) indicates those articles to be included in an accompanying Reprint Book.

38506 **Comment on "Spontaneous generation of string tension and quark potential".** Braaten, E.; Tse, S.; Pisarski, R.D. (Department of Physics and Astronomy, Northwestern University, Evanston, Illinois 60201 and Fermi National Accelerator Laboratory, Batavia, Illinois 60510). *Physical Review Letters;* **60**: No. 26, 2806-2806(27 Jun 1988).

A Comment on the Letter by H. Kleinert, Phys. Rev. Lett. 58, 1915 (1987).

38507 **BRST primer.** Nemeschansky, D.; Preitschopf, C.; Weinstein, M. (Department of Physics, University of Southern California, Los Angeles, California 90089). *Annals of Physics (New York);* **183**: No. 2, 226-268(1 May 1988).

We develop a Hamiltonian formulation of the BRST method for quantizing constrained systems. The rigid rotor is studied in detail and the similarity of this simple quantum system to a guage theory is explicitly demonstrated. The system is quantized as a gauge theory and then the similarity between BRST and the Gupta—Bleuler approach is displayed. We also apply our formalism to true gauge theories. Both Abelian and non-Abelian gauge theories are studied in detail. Finally, the Hamiltonian treatment of the relativistic and the spinning relativistic particle is presented. copyright 1988 Academic Press, Inc.

38508 **Ambiguity in fermionic string perturbation theory.** Atick, J.J.; Rabin, J.M.; Sen, A. (Institute for Advanced Study, Princeton, NJ (USA); California Univ., San Diego, La Jolla (USA). Dept. of Mathematics; Stanford Linear Accelerator Center, CA (USA)). *Nuclear Physics [Section] B;* **299**: No. 2, 279-294(4 Apr 1988). Contract AC02-76ER02220;AC02-82ER40073;AC03-76SF00515.

Recent investigation by Verlinde and Verlinde has shown that the fermionic string loop amplitudes change by a total derivative term in the moduli space under a change of basis of the supermoduli. This ambiguity is addressed in the context of the heterotic string theory, and shown to be a consequence of an inherent ambiguity in defining integration over the variables of a Grassmann algebra - in this case the Grassmann-valued coordinates of the supermoduli space. A resolution of this ambiguity in genus-two within this formalism is also presented.

38509 **Renormalisation of gauge theories using effective Lagrangians, I.** Warr, B.J. (California Institute of Technology, Pasadena, California 91125). *Annals of Physics (New York);* **183**: No. 1, 1-58(Apr 1988).

The renormalisation of field theories is unterstandable in an elegant way in terms of the flow of effective LAgrangians. At distances much larger than some physical cutoff, the physics is described by a small number of parameters, which can be identified purely by dimensional analysis. For scalar theories a rigorous yet simple proof of renormalisability based on this concept was given by Polchinski. For gauge theories there is the extra issue of unitarity of the renormalized S-matrix, which can only be guaranteed by proving renormalised Ward identities, and in this paper we carry this out for the case of non-chiral matter couplings. The second paper in this series extends to chiral theories and to N = 1 supersymmetric Yang-Mills. copyright 1988 Academic Press, Inc.

38510 **Renormalisation of gauge theories using effective Lagrangians, II.** Warr, B.J. (California Institute of Technology, Pasadena, California 91125). *Annals of Physics (New York);* **183**: No. 1, 59-79(Apr 1988).

The method of effective Lagrangian flow provides the most physically illuminating discussion of renormalisation theory. The extra complication of the unitarity question in gauge theories was solved in the first paper (for the non-chiral case) and in this paper we extend the results to chiral gauge theories and rigid N = 1 super Yang—Mills. We prove that one-loop anomaly cancellation is a sufficient condition for unitarity, and we also prove the Adler—Bardeen theorem for the divergence of a non-gauged axial current. Finally, we show that the gravitational anomalies of a gauged current are removed completely when canceled at the one-loop level. copyright 1988 Academic Press, Inc.

38511 **Dysfunctional methods and the effective potential.** Dannenberg, A. (Lawrence Berkeley Lab., CA (USA); California Univ., Berkeley (USA). Dept. of Physics). *Physics Letters [Section] B;* **202**: No. 1, 110-116(25 Feb 1988). Contract AC03-76SF00098.

The effective potential is a useful and much-studied object. It is known to be both real and convex, but a perturbative calculation often gives a complex and nonconvex result. In this letter we address the apparent conflict between perturbation theory and the convexity of the effective potential.

38512 **Analytic and numerical results on the chiral transition in SU(2) lattice gauge-Higgs theory with fermions.** Lee, I.H ; Shrock, R.E. (Brookhaven National Lab., Upton, NY (USA). Physics Dept.; State Univ. of New York, Stony Brook (USA). Inst. for Theoretical Physics). *Physics Letters [Section] B;* **201**: No. 4, 497-502(18 Feb 1988). Contract AC02-76CH00016.

We present an analytic study of the (zero-temperature) chiral symmetry-breaking phase transition in SU(2) lattice gauge-Higgs theory with fermions, relevant to the SU(2) sector of the standard electroweak theory. The transition is found to be second-order and the critical gauge-Higgs coupling is calculated in the limit of strong gauge coupling. New Monte Carlo measurements for quenched I=1/2 fermions are presented and found to be in excellent agree-

ment with the analytic results, which are not limited to the quenched approximation.

38513 **Example and dimensional regularization with antisymmetric tensors.** Bos, M. (Center for Theoretical Laboratory for Nuclear Science and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Annals of Physics (New York);* **181**: No. 2, 177-197(1 Feb 1988).

Dimensional regularization with antisymmetric tensors is discussed on the basis of a specific example, the two-dimensional WZW model. A manifestly self-consistent definition of ϵ/sup μ// sup ν/ is used, violating the full Lorentz invariance of the dimensionally continued space-time. The ensuing apparent pathology in the renormalization procedure is resolved by a careful study of the renormalization group. The argument is checked and illustrated by explicit calculations up to three loops. copyright 1988 Academic Press, Inc.

38515 **(BNL—41123) Transverse energy distributions in ^{16}O-nucleus collisions.** Corriveau, F. (Brookhaven National Lab., Upton, NY (USA); McGill Univ., Montreal, Quebec (Canada). Dept. of Physics). 27 Nov 1987. Contract AC02-76CH00016. 7p. (CONF-8708166—6). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009891/JAW.

From 6. international conference on ultra-relativistic nucleus-nucleus collisions; Nordkirchen, F.R. Germany (24 Aug 1987).

38516 **(BNL—41308) Transverse energy flow in 10 GeV/nucleon ^{28}Si nucleus collisions.** Fatyga, M. (Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 5p. (CONF-880399—5). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012143/JAW.

From 23. Rencontre de Moriond: current issues in hadron physics; Les Arcs, France (13 Mar 1988).

Transverse energy distributions have been measured for collisions of 10 GeV/nucleon Si with targets of Al, Cu, and Pb using a combination of a NaI wall and a uranium/copper calorimeter. Very large stopping is observed, with continuous evolution of angular distributions of reaction products for the increasing mass of the target.

38517 **(CONF-871101—83) Preparation and benchmarking of ANSL-V cross sections for advanced neutron source reactor studies.** Arwood, J.W.; Ford, W.E. III; Greene, N.M.; Primm, R.T. III; Waddell, M.W.; Webster, C.C.; Westfall, R.M.; Wright, R.Q. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 9p. (CONF-871101—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008685/JAW.

From California State Air Resources Board; Los Angeles, CA, USA (15 Nov 1987).

Validity of selected data from the fine-group neutron library was satisfactorily tested in performance parameter calculations for the BAPL-1, TRX-1, and ZEEP-1 thermal lattice benchmarks. BAPL-2 is an H_2O moderated, uranium oxide lattice; TRX-1 is an H_2O moderated, 1.31 weight percent enriched uranium metal lattice; ZEEP-1 is a D_2O-moderated, natural uranium lattice. 26 refs., 1 tab.

38518 **(DOE/ER/40269—2) [Pion-nucleus interactions and nucleon transfer reactions primarily at LAMPF, TRIUMF, and IUCF]: Technical progress report, [October 1, 1986-October 1, 1987].** Kraushaar, J.J. (Colorado Univ., Boulder (USA). Nuclear Physics Lab.). 1 Oct 1987. Contract FG02-86ER40269. 131p. (NPL—1028). NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88008048/JAW.

This report summarizes work carried out between October 1, 1986 and October 1, 1987 in the Nuclear Physics Laboratory of the Department of Physics at the University of Colorado, Boulder. Other efforts in the laboratory, such as development of an R.F. cavity for an advanced hadron facility accelerator, beam pickoff devices, a buncher for the LAMPF proton beam, and the US-Brazil Cooperative Science Program are described.

38519 (INIS-mf—11223, pp 313-329) **Charged particle multiplicities in π^-, K^-, p-bar interactions with nuclei and high p perpendicular to π^- A interactions at 40 GeVc.** Bohm, G.; Friebel, W.; Gensch, U. (Akademie der Wissenschaften der DDR, Berlin-Zeuthen. Inst. fuer Hochenergiephysik). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

Results from two experiments performed with the RISK streamer chamber spectrometer at 40 GeVc of incident momentum are presented. In the first one interactions of π^-, K^-, and p-bar on Li,C,S,Cu,Cs1 and Pb were studied, in the second one the interactions of π^- on C,Cu and Pb were selected with single particle high p perpendicular to trigger. Charged particles and protons multiplicities as well as correlations between them were investigated. The use of high p perpendicular to trigger led to the increase of all observed multiplicities. 9 refs., 9 figs., 2 tabs.

38520 **(SLAC—316) Workshop on electronuclear physics with internal targets: Proceedings.** Arnold, R.G.; Minehart, R.C. (eds.). (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). May 1987. Contract AC03-76SF00515. 227p. (CONF-870165—). NTIS, PC A11;3. Order Number DE88010766/JAW.

From Workshop on electronuclear physics with internal targets; Stanford, CA, USA (5 Jan 1987).

The Workshop on Electronuclear Physics with Internal Targets was held at SLAC on January 5-8, 1987. The idea for this workshop grew out of interest among physicists at SLAC and MIT/Bates who have been exploring the possibilities for internal targets in the PEP ring at SLAC and in a proposed stretcher ring at MIT/Bates. The aim of the workshop was to bring together physicists from these groups and from other laboratories and universities to discuss the new physics that could be made accessible with internal targets, and to share information on recent developments in internal target technology, on the impact of internal targets on ring operation, and on the detector requirements. The workshop was sponsored by NPAS, the program of Nuclear Physics at SLAC, and it was attended by more than 100 physicists from the US, Canada, Europe, and Japan. The workshop sessions began with two days of invited talks followed by two days of shorter presentations organized by the chairmen of four Working Groups. Written versions of all the plenary talks and all but four of the Working Group talks are presented here.

38521 **Recent References: September through December 1987.** Ramavataram, S. (Brookhaven National Laboratory, Upton, New York 11973). *Nuclear Data Sheets;* **53**: No. 3, 407-490(Mar 1988).

A bibliography and reaction index are presented for all literature received by the National Nuclear Data Center or assigned keywords between September and December 1987. (AIP)

38522 **Thick-target bombardments with high energy charged particles: Experimental improvements and spatial distribution of low-energy secondary neutrons.** Englert, P.; Reedy, R.C.; Arnold, J.R. (San Jose State Univ., CA (USA). Dept. of Chemistry; Los Alamos National Lab. (LANL), NM (USA). Earth and Space Sciences Div.; California Univ., San Diego, La Jolla (USA). Dept. of Chemistry). *Nuclear Instruments and Methods in Physics Research;* 262: No. 2/3, 496-502(15 Dec 1987).

A thick target with dimensions of 100x100x200 cm and a mass of about 16 000 kg was constructed for the simulation of effects of the galactic cosmic radiation (GCR) with matter. After irradiations of this target with 2.1-GeV protons and 800-MeVnucleon alpha particles, the spatial distribution of low-energy secondary neutrons was determined by neutroncapture reaction products. Due to the large dimensions of the bombarded target and the water-free material used, conditions close to those expected in anhydrous planetary surfaces were successfully simulated, with the exception of the 2π incidence of the GCR. Secondary low-energy neutron luxes developed broad maxima at depths of 100 to 200 gcm^{2} for the proton irradiation and at depths of 70 to 150 gcm^{2} for the alpha particle run. These observations are in agreement with predictions and other observations for the proton experiment. The alpha-particle irradiation, however, demonstrates the role that these particles, which only comprise proportional to 10% of the GCR particle flux, play on the development of the subsurface low-energy neutron fluxes in extraterrestrial objects. Gomparisons with similar results from other thick target experiments demonstrate the advantages of the thick target arrangement used.

38523 **Integral test of several fission cross-sections in the neutron spectrum produced by 7-MeV deuterons incident on a thick Be-metal target.** Watanabe, Y.; Meadows, J.W.; Smith, D.L. (Argonne National Lab., IL (USA)). *Annals of Nuclear Energy;* 14: No. 10, 563-569(1987). Contract W-31-109-ENG-38.

Integral neutron-fission cross-section ratios have been measured for ^{232}Th^{236}U, ^{237}Np^{235}U, ^{238}U^{235}U, ^{237}Np^{238}U, ^{232}Th^{237}Np, ^{236}U^{235}U, ^{239}Pu^{235}U, ^{233}U^{235}U, ^{234}U^{235}U, ^{234}U^{236}U and ^{236}U^{238}U in the continuum neutron spectrum produced by bombardment of a thick Be-metal target with 7-MeV deuterons. A consistent set of fission cross-sections relative to ^{235}U was obtained and compared with calculated values based on the representation of the neutron spectrum derived from time-of-flight measurements and the ENDFB-V and JENDL-2 evaluations of the differential cross-sections. It was found that the results are relatively insensitive to small changes in the representation of the neutron spectrum. The calculated and experimental values for most of the isotopes are consistent within the experimental error, but for ^{234}U and ^{236}U the calculated cross-sections are high by 6-7% which suggests that a re-normalization of these cross-sections may be needed in the 1-6 MeV region.

38524 **(AD-A—190306/1/XAB) SDIO/IST ultrashort-wavelength laser. Moessbauer effect in gamma-ray lasers. Interim report for period ending 28 February 1987.** Hoy, G.R.; Taylor, R.D. (Old Dominion Univ., Norfolk, VA (USA)). Mar 1987. 26p. NTIS, PC A03/MF A01.

In order to gain some perspective on the relationship of the Moessbauer effect to the possible development of gamma-ray lasers, it is useful to review the Moessbauer-effect literature. These results show that: 1) Rayleigh and nuclear resonant diffraction by scattering is small, 2) nuclear anomalous dispersion occurs, 3) interference can occur between nuclear hyperfine components in nuclear resonant diffraction, 4) in nuclear-resonant Bragg scattering, processes having different final nuclear spin projections are incoherent, and 6) there can be anomalously deep penetration and high reflectivity using single crystals as a result of the suppression of inelastic channels.

38525 **(DOE/ER/10493—16) Atomic mass measurements and nuclear spectroscopy at TRISTAN and nuclidic mass measurements at LAMPF: Progress report for the period February 1, 1985-August 31, 1987.** Brenner, D.S. (Clark Univ., Worcester, MA (USA)). Sep 1987. Contract AC02-79ER10493. 22p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008001/JAW.

The Clark University research program is concerned with experimental determination of the nuclear structure of isotopes far from the line of β stability and their masses. This work is accomplished, primarily, by use of the TRISTAN on-line mass separator located at the High Flux Beam Reactor, Brookhaven National Laboratory, where investigations of short-lived fission products have been actively pursued since 1980. In 1985 mass measurements of light isotopes produced by fragmentation reactions on heavy targets were initiated using the TOFI (Time-of-flight Isochronous) Spectrometer at the LAMPF accelerator, Los Alamos National Laboratory. Together, the two facilities are capable of providing complementary information, potentially of great value in understanding the sum total effect of all nuclear interactions in a given nucleus, which gives rise to the property known as the mass. The thrust of the spectroscopic studies at TRISTAN has been to develop a database for neutron-rich, far-from-stability nuclides in order to provide a new testing ground for nuclear models. In particular, we have been active in pursuing microscopic and phenomenological understanding of nuclear structure in regions of shape transition near shell and subshell closures. Recent efforts have been concentrated on exploiting some very new ideas based on the pervasive influence of the proton-neutron interaction that offer the possibility of achieving a unified interpretation of nuclear structure and its evolution, of the interrelationships of different nuclear shapes and modes of excitation, and of the nuclear mass.

38526 **(LA-UR—88-1696) Status of fission yield data.** England, T.R.; Blachot, J. (Los Alamos National Lab., NM (USA); CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). 1988. Contract W-7405-ENG-36. 8p. (CONF-880546—4). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010918/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

In this paper we summarize the current status of the recent US evaluation for 34 fissioning nuclides at one or more neutron incident energies and for spontaneous fission. Currently there are 50 yields sets, and for each we have independent and cumulative yields and uncertainties for approximately 1100 fission products. When finalized the recommended data will become part of Version VI of the US ENDF/B. Other major evaluations in progress that are included in a recently formed IAEA Coordinated Research Program are also summarized. In a second part we review two empirical models in use to estimate independent yields. Comparison of model estimates with measured data is presented, including a comparison with some recent data obtained from Lohengrin (Cf-249 T). 18 refs., 13 figs., 3 tabs.

38527 **(BONN-IR—87-47) Photofission of polarized deuterons. Measurements of angular distributions at E/sub γ/ = 450 and 650 MeV.** Sundermann, D. (Bonn Univ. (Germany, F.R.). Physikalisches Inst.). Dec 1987. 103p. (In German). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753536/JAW.

At the Bonn 2.5 GeV electron synchrotron we have measured the vector target asymmetry of the reaction γ+d/sub arrow up/ -> p+n with a polarized deuterium target. We have taken data at photon energies of 450 MeV and 650 MeV and at proton-cm-angles between 25° and 155° by using a bremsstrahlung photon beam. With the new target material deuterated ammonia we yielded a maximum vector polarization of 44% for the deuterons at 0.2 K. Proton and neutron were detected in coincidence. The total photon energy acceptance was divided into bins down to 30 MeV by using Monte Carlo techniques. We determined the energy dependence of the target asymmetry for photon energies between 400 and 700

MeV for every measured proton angle. A fit to the data was performed in order to investigate the maximum total angular momentum which occurs. For one kinematical setting also the tensor asymmetry Z was measured for the first time. Our results are compared with theoretical analyses, best qualitative agreement for T is obtained with a relativistic Bonn analysis. (orig.HSI).

38528 (CEA-N—2539) Contributions to the study of the reaction pd→tπ⁺. Kerboul, C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Physique Nucleaire a Moyenne Energie; Strasbourg-1 Univ., 67 (France)). Jun 1987. 174p. (In French). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88752565/JAW.

We have measured the excitation function of the analysing power T/sub 20/ and of the cross section, at 0 deg and 180 deg, from threshold to 2.2 GeV for the antidp->/sup 3/Heπ/sup 0/ reaction. We have also measured the angular distributions of the analysing power Ay for the antipd->tπ/sup +/ reaction, at 1.2, 1.3 and 1.45 GeV. Having measured T/sub 20/ and the cross section at 0 deg, we have extracted the experimental values of the two independent amplitudes for (polarized)d.p->/sup 3/Heπ/sup 0/ in colinear kinematics. At threshold, the value of T/sub 20/ is near the absolute minimum, showing that the pion at rest is absorbed on an S=1 pair of nucleons in /sup 3/He. We have analysed our data with microscopic calculations in terms of two-body and three-body mechanisms. At 0 deg, only two-body mechanisms are important. At 180 deg, even in the resonance (3.3) excitation region, three-body mechanisms are necessary and become dominant around T/sub d/ = 2 GeV. Nevertheless, the analysing power is not reproduced by calculations including all these mechanisms. It seems that the spin-flip amplitude is never well described.

38529 (CONF-880386—7) Physics in the GeV region with polarized targets in electron storage rings. Holt, R.J. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 8p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011966/JAW.

From International conference on spin-observables in nuclear physics; Telluride, CO, USA (14 Mar 1988).

There is evidence from the D(γ,p)n reaction that the meson-exchange model is failing in the GeV region. Surprisingly, it appears that the new (Dγ,p)n data favor the energy dependence of the nuclear chromodynamics model rather that of the meson-exchange model. Application of the polarization method to electron scattering studies is in its infancy, and it is potentially a very powerful technique. The internal target method coupled with laser-driven polarized targets should represent an important tool for nuclear physics.

38530 (CONF-880560—2) Two-body photodisintegration of the deuteron above 1 GeV. Holt, R.J.; Freedman, S.J.; Geesaman, D.F.; Gilman, R.; Green, M.C.; Jackson, H.E.; Kowalczyk, R.; Marchand, C.; Napolitano, J.; Nelson, J. (Argonne National Lab., IL (USA); California Inst. of Tech., Pasadena (USA); Northwestern Univ., Evanston, IL (USA); American Univ., Washington, DC; Massachusetts Inst. of Tech., Cambridge (USA); Stanford Univ., CA (USA)). 1988. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012037/JAW.

From Topical conference on nuclear quantum chromodynamics; Argonne, IL, USA (19 May 1988).

One of the central issues in nuclear physics is the identification of clear signatures for quarks in nuclei. A guiding principle in this search is to perform experiments with high energy electromagnetic probes of the simplest nucleus, the deuteron, a system which is particularly amenable to theoretical interpretation. It has long been known that the quark counting rules seem to apply for electron elastic scattering from the pion and nucleon. However, the rapid decline in the cross section for electron scattering from the deuteron, a six-quark system, renders an experiment at high momentum transfer unfeasible. Clearly, the dimensional-scaling region is not reached for electron-deuteron elastic scattering as indicated. This led Brodsky and Chertok to analyze these data in terms of the reduced nuclear amplitudes and produce, in effect, scaling at a lower momentum transfer. Presently, this is the only known case where the reduced nuclear amplitude analysis seems to apply. In the present work we abandon elastic electron scattering in favor of an exclusive photoreaction with the deuteron. The simplest process involving a nucleus is the γd → pn reaction. Here, n = 13 and an s^{-11} dependence is expected where the quark counting rules are valid. Naively, one would expect that the energy region where the quark counting rules are valid to be most naturally described in terms of a quark or parton basis rather than a nucleon basis, and thereby provide a signature quark effects in nuclei. Hitherto no s^{-11} dependence has been observed for the data below 1 GeV. As a test of the energy-dependence for the γd → pn reaction, we have performed the first measurements for this process above 1 GeV.

38531 (CONF-8805142—2) Measurement of two-body deuteron photodisintegration at high photon energies and theta/sub CM/ = 90°. Napolitano, J.; Freedman, S.J.; Geesaman, D.F.; Gilman, R.; Green, M.C.; Holt, R.J.; Jackson, H.E.; Kowalczyk, R.; Marchand, C.; Nelson, J. (Argonne National Lab., IL (USA); Northwestern Univ., Evanston, IL (USA); American Univ., Washington, DC; Massachusetts Inst. of Tech., Cambridge (USA); Stanford Univ., CA (USA); Virginia Univ., Charlottesville (USA)). 1988. Contract W-31-109-ENG-38. 6p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011996/JAW.

From 3. conference on the intersections between particle and nuclear physics; Rockport, ME, USA (14 May 1988).

The authors report preliminary results from a measurement of the process $^2H(\gamma,p)n$ at theta/sub CM/ = 90° and for photon energies between 0.8 and 1.6 GeV. The results are compared to a conventional calculation based on meson-exchange and to models based on sub-nucleonic degrees of freedom. We find strong disagreement with the meson-exchange calculation, and best agreement with simple constituent counting at the highest energies.

38532 (CONF-8805142—4) Measurement of the deep-inelastic spin-dependent structure functions of the proton and neutron at HERA. Beck, D.H.; Filippone, B.W.; Jourdan, J.; McKeown, R.D.; Milner, R.G.; Woodward, C.E.; Freedman, S.J.; Geesaman, D.F.; Holt, R.J.; Jackson, H.E. (California Inst. of Tech., Pasadena (USA). W.K. Kellogg Radiation Lab.; Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012052/JAW.

From 3. conference on the intersections between particle and nuclear physics; Rockport, ME, USA (14 May 1988).

It is possible to measure the deep-inelastic spin-dependent structure functions g_1/sup p/(x) and g_1/sup n/(x) for the proton and neutron using internal polarized hydrogen, deuterium, and ^3He targets of polarization 50% and thickness 10^{14} to 10^{15} cm^{-2} and the 60 mA longitudinally polarized 30 GeV electron beam in the HERA electron storage ring. The measurement of the deep-inelastic spin-structure of both isospin states of the nucleon at the same kinematics and using the same apparatus allows the Bjorken sum rule to be experimentally checked. In addition, it uniquely constrains the spin distribution of the u and d quarks as a function of x in any model of the nucleon. Possible target and detector configurations are described and an estimate of the accuracy of such a measurement is presented.

38533 (UCRL—97405) Triton memory time in solid DT and its nuclear polarization. Souers, P. C.; Fearon, E. M.; Mapoles, E. R.; Sater, J. D.; Collins, G. W.; Gaines, J. R.; Sherman, R. H.; Bartlit, J. R. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 35p. (CONF-880505—19). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011337/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

The expected value of nuclear spin polarization to inertial confinement fusion is recapitulated. A comparison of brute force versus dynamic nuclear polarization, as applied to solid deuterium-tritium, is given, and the need for a long triton polarization memory time (longitudinal nuclear relaxation time) is shown. The time constant for 25 mol%T_2-50 DT-25 D_2 is a short 0.3 s at 5{degree}K and waiting lowers it to 0.1 s. Use of 90 to 96 mol% molecular DT raises the time constant to 0.9 s and addition of

about 20 mol% nH_3 increases it to 5 to 7 s. The theory shows that the species shortening the triton memory time is the J = 1 T_2, which can be reduced in our samples only by self-catalysis. The heating in order to mix in nH_3 increases the percent of J = 1 T_2 and mixing may not be perfect. The experiments have increased the triton memory time twenty-fold and shown that removal of the J = 1 T_2 is the key to improved results.

38534 **(UCRL—98648) Problems and progress in tritium beta decay.** Balke, B.; Fackler, O.; Mugge, M.; White, R. (Lawrence Livermore National Lab., CA (USA)). Apr 1988. Contract W-7405-ENG-48. 7p. (CONF-880173—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010616/JAW.

From 22. Moriond workshop on neutrinos and exotic phenomena in particle physics and astrophysics; Les Arcs, France (23 Jan 1988).

It has been nearly eight years since the group led by Lubimov first saw evidence for a finite neutrino mass in the tritium beta decay spectrum. Their measurement provided a great stimulus to the field; the number of experiments currently underway reflects the significance of their claim. The fact that further data are only now beginning to appear reflects the difficulty of this measurement. As an introduction to related papers in these proceedings, we briefly consider the key elements involved in neutrino-mass measurements using tritium beta decay and list the experiments currently underway in the field. 5 refs., 1 tab.

38535 **(CENBG—8717) Separation and spectroscopic study of exotic nuclei at GANIL.** Jean, D. (Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires). Jul 1987. 222p. (In French). NTIS (US Sales Only), PC A10/MF A01. Order Number DE88753941/JAW.

A new isotopic separation method is presented. It allows the studies of radioactive atomic nuclei produced in high energy heavy ions collisions. Two experiments were performed at the GANIL facilities (Grand Accelerateur National d'Ions Lourds, Caen). They are analysed on the fields of the experimental resolution and of the spectroscopic results. Measurements of beta decay half lives and gamma spectra are brought for sixteen neutron rich nuclei at the frontier of the experimental knowledge.

38536 **(CONF-880546—15) Neutron standard data.** Peelle, R.; Conde, H. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 27p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011398/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

The neutron standards are reviewed with emphasis on the evaluation for ENDFB-VI. Also discussed are the neutron spectrum of ^{252}Cf spontaneous fission, activation cross sections for neutron flux measurement, and standards for neutron energies greater than 20 MeV. Recommendations are made for future work. 21 refs., 6 figs., 3 tabs.

38537 **(CONF-880546—18) Interplay of direct and compound-nucleus mechanisms in neutron capture by light nuclides.** Raman, S.; Kahane, S.; Lynn, J.E. (Oak Ridge National Lab., TN (USA); Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev; UKAEA Atomic Energy Research Establishment, Harwell). 1988. Contract AC05-84OR21400. 10p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011828/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

The authors discuss the direct-capture theory pertaining to primary electric-dipole (E1) transitions following slow-neutron capture. For approximately 20 light nuclides that we have studied, estimates of direct-capture cross sections using optical-model potentials with physically realistic parameters are in reasonable agreement with the data. Minor disagreements that exist are consistent with extrapolations to light nuclides of generally accepted formulations of compound-nucleus capture. In dealing with nuclei soft to vibrations, we have considered the possible effects of coupling of the collective motion with the optical potential in the framework of R-matrix theory. In such cases, we find that the inclusion of inelastic channels results in systematic changes in the calculated cross sections.

38538 **(CRN-PN—87-19) Incomplete fusion and preequilibrium emission in the reactions $^{40}Ar + {}^{45}Sc$, $^{40}Ar + {}^{24}Mg$, $^{40}Ar + {}^{13}C$ at 27.5 MeV by nucleon.** Gonin, M. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires). Nov 1987. 79p. (In French). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753945/JAW.

The evaporation residues were detected by means of a heavy ion time of flight system. As an attempt to examine in detail incomplete fusion for medium and light mass systems we have studied the reactions with experimental conditions allowing a complete separation and identification of the final products. We have analysed the velocity of the evaporation residues. The preequilibrium particles appear to be governed by two different regimes. The results show clearly that various compound nuclei are formed in the incomplete fusion process. The $^{40}Ar + {}^{13}C$ reaction appears to be a special case. In the $^{40}Ar + {}^{24}Mg$ reaction, the study of preequilibrium particles in coincidence with evaporation residues confirms the results suggested for the heavy fragments.

38539 **(CRN-PN—87-20) Trends in central collisions of light and medium mass heavy ions.** Coffin, J.P. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires). 1987. 16p. (CONF-8710326—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753481/JAW.

From Institut National de Physique Nucleaire et de Physique des Particules (IN2P3 - France) and by the Institut of Physical and Chemical Research; Riken, Japan (12 Oct 1987).

The correlated phenomena of preequilibrium emission and incomplete fusion in heavy ion collisions at low impact parameters are discussed for the $^{40}Ar + {}^{13}C$, ^{24}Mg and ^{45}Sc reactions, performed at E/sub 40Ar/=27.5 MeVnucleon. Inclusive and exclusive data relative to heavy residues and light particles are presented. The characteristics of preequilibrium emission and incomplete fusion are examined, and observations at variance with earlier conclusions are considered. Transient modes from evaporation towards multifragmentation or incomplete fusion versus massive transfer of nucleons are discussed.

38540 (INIS-BR—1018, pp 17) **Ternary fission of aluminium, titanium, cobalt and zirconium induced by photons from 0.8 to 1.8 GeV.** Sousa, E.V. de; Milomen, W.C.C.; Lima, D.A. de; Tavares, O.A.P.; Husmann, D. From 5. meeting of physicists from northeast; Natal, Brazil (12 Nov 1987).

38541 (INIS-mf—11223, pp 271-288) **Results on hadron production in 200 GeV μ-Cu and μ-C deep inelastic interactions from the EMC.** Nassalski, J. (Institute of Nuclear Research, Warsaw (Poland)). 1984. NTIS (US Sales Only), PC A99/MF A01. Order Number DE88702874/JAW. (CONF-8405236—).

From 7. symposium on elementary particle physics; Kazimierz, Poland (21 May 1984).

The nuclear structure function F_2 effects and the effects of the jet absorption in the nuclear matter are searched for in the z-distributions of charged hadrons. The nuclear absorption effects in Cu relative to C are seen only for the virtual photon energies below 70 GeV. The results indicate that at higher energies the parton fragmentation distances are greater than the nuclear radius

and that the parton absorption cross section is less than 10 mb. 8 refs., 6 figs.

38542 (JINR-E—1-87-246) Observation of the dominance of the target Δ excitation and their collective nature in the (^{3}He,t) charge-exchange at high energies. Ableev, V.G.; Eliseev, S.M.; Inosemtsev, V.I. and others. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702903/JAW.

Submitted to the 11. Intern. Conference on Particles and Nuclei (PANIC-87), Kyoto, Japan, April 1987.

The results of measurement of differential sections of the (^{3}He,t) charge exhange on carbon nuclei and protons are presented. It is shown that the reaction on a nucleus proceeds mainly through the excitation of Δ-isobars. It is impossible to reduce the process of that exciation to the quasifree production of Δ-isobar on an individual intranuclear nucleon and a subsequent free motion of the isobar through nucleus. The collective effects caused by other nucleons are important. 19 refs.; 6 figs.; 1 tab.

38543 (LA-UR—88-1526) Cross-section measurements for radioactive samples. Koehler, P.E.; O'Brien, H.A. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 24p. (CONF-880546—2; CONF-880546—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010920/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

The measurement of (n,p), (n,α) and (n,γ) cross sections for radioactive nuclei is of interest to both nuclear physics and astrophysics. For example, using these reactions, properties of levels in nuclei at high excitation energies, which are difficult or impossible to study using other reactions, can be investigated. Also, reaction rates for both big-bang and stellar nucleosynthesis can be obtained from these measurements. In the past, the large background associated with the sample activity limited these types of measurements to radioisotopes with very long half-lives. The advent of the low-energy, high-intensity neutron source at the Los Alamos Neutron Scattering CEnter (LANSCE) has greatly increased the number of nuclei which can be studied. Examples of (n,p) measurements on samples with half lives as short as fifty-three days will be given. The nuclear physics and astrophysics to be learned from these data will be discussed. Additional difficulties are encountered when making (n,γ) rather than (n,p) or (n,α) measurements. However, with a properly-designed detector, and the high peak neutron intensities now available, (n,γ) measurements can be made for nuclei with half lives as short as several months. Progress on the Los Alamos (n,γ) cross-section measurement program for radioactive samples will be discussed. 39 refs., 7 figs.

38544 (LYCEN—8740) Protons and neutrons contributions to the charge longitudinal response. Alberico, W.M.; Molinari, A.; Chanfray, G.; Ericson, M. (Turin Univ. (IT)). (Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire). 1987. 13p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753975/JAW.

The charge longitudinal response of nuclei, as measured by inclusive inelastic electron scattering, is investigated in the semiclassical RPA framework. The proton and neutron contributions to the total response are explicitly separated out. It is found that a sizable neutron ejection can be induced by RPA correlations, particularly at low momentum and energy transfer. A comparison of our theory with the experimental data is presented, also in the case of asymmetric nuclei (Nnot =Z). In particular, the differences in the neutron contributions between ^{40}Ca and ^{48}Ca are discussed.

38545 (UCRL—96792) A program to obtain reliable photoabsorption cross sections. Del Grande, N.K.; Tirsell, K.G. (Lawrence Livermore National Lab., CA (USA)). Jan 1988. Contract W-7405-ENG-48. 6p. (CONF-880110—30). NTIS, PC A02;3. Order Number DE88008904/JAW.

From SPIE O-E Lase '88: optoelectronics and laser applications in science and engineering; Los Angeles, CA, USA (10 Jan 1988).

A program to obtain reliable photoabsorption cross sections for a broad range of elements has been initiated at Lawrence Livermore National Laboratory. Using well-characterized samples, absolute measurements have been made with overall uncertainties of {+-}10% or less over energy ranges from about 50 eV to several keV, at several synchrotron radiation facilities. More than a dozen elements have been investigated and other measurements are being planned for elements beryllium (Z-4) through uranium (Z-92). Among the interesting phenomena observed are the resonances/enhancements which seem to accompany virtually every inner shell threshold. Specific examples discussed in this paper include carbon, nickel and uranium. Comparison with theory and existing data compilations/data bases indicate the need for substantial theoretical and compilation improvements. 24 refs., 6 figs.

38546 K^+-nucleus scattering and the "swelling" of nucleons in nuclei. Brown, G.E.; Dover, C.B.; Siegel, P.B.; Weise, W. (State University of New York, Stony Brook, New York 11794). *Physical Review Letters;* **60**: No. 26, 2723-2726(27 Jun 1988).

We investigate the utility of the K^+ meson as a probe of effective-size modifications ("swelling") of nucleons in the nuclear medium. The K^+-nucleus elastic and total cross sections are found to be sensitive to the density-dependent effective masses of the vector mesons (rho,ω) whose exchange is responsible for the dominant part of the low-energy K^+-nucleon interaction. This density dependence is estimated in several ways and used to construct a K^+-nucleus optical potential. Such a model is consistent with the $K^+ + ^{12}C$ data at 800 MeVc, and provides a physical picture of the "swelling" mechanism in terms of the medium modifications of the meson cloud of the nucleon.

38547 Oxygen-induced reactions at 60 A GeV and 200 A GeV studied by calorimetry. Sorensen, S.P.; Obenshain, F.E.; Albrecht, R.; Bock, R.; Claesson, G.; Gutbrod, H.H.; Kolb, B.W.; Lund, I.; Schmidt, H.R.; Siemiarczuk, T. (Tennessee Univ., Knoxville (USA); Oak Ridge National Lab., TN (USA); Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). *Zeitschrift fuer Physik [Sektion] C: Particles and Fields;* **38**: No. 1/2, 3-14(Apr 1988). (CONF-8708166—).

From 6. international conference on ultra-relativistic nucleus-nucleus collisions; Nordkirchen, F.R. Germany (24 Aug 1987).

Results based on calorimetric measurements are presented from reactions of 60 A GeV and 200 A GeV ^{16}O projectiles with C, Cu, Ag, and Au nuclei. Minimum-bias cross sections are discussed. Energy spectra measured at zero degrees and transverse-energy distributions for the pseudorapidity range 2.4 ≦ eta ≦ 5.5 are shown. An analysis of the average transverse energy in terms of the number of participating nucleons and the number of binary nucleon-nucleon collisions is presented. Estimates of nuclear stopping and of attained energy densities are made.

38548 Emission of complex fragments from highly excited systems produced in ^{93}Nb+^{9}Be and ^{27}Al reactions at EA = 25.4 and 30.3 MeV. Charity, R.J.; Bowman, D.R.; Liu, Z.H.; McDonald, R.J.; McMahan, M.A.; Wozniak, G.J.; Moretto, L.G.; Bradley, S.; Kehoe, W.L.; Mignery, A.C. (Lawrence Berkeley Lab., CA (USA). Nuclear Science Div.; Maryland Univ., College Park (USA). Dept. of Chemistry). *Nuclear Physics [Section] A;* **476**: No. 3, 516-544(18 Jan 1988). Contract AC03-76SF00098.

Complex fragments with atomic numbers intermediate between that of the target and projectile have been detected in the reverse-kinematics reactions of ^{93}Nb plus ^{9}Be and ^{27}Al at bombarding energies of EA = 25.4 and 30.3 MeV. Experimental results from inclusive and coincidence measurements are presented and are used to characterize these fragments as the statistical, binary-decay products of highly excited compound nuclei formed in fusion-like reactions.

38549 (DOE/ER/40364—1) Nuclear studies with intermediate energy probes: Annual performance report, May 15, 1987-May 14, 1988. Norum, B.E. (Virginia Univ., Charlottesville (USA). Dept. of Physics). Mar 1988. Contract FG05-87ER40364. 19p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007724/JAW.

Nuclear studies with intermediate energy probes have been pursued at LAMPF, IUCF, and NIKHEF-K (Amsterdam). Proton scattering measurements of the calcium isotopes were performed at both LAMPF and IUCF; preliminary measurements of sellected s-d shell nuclei were also made at LAMPF. Analysis of the collected data is underway. Measurements of electron scattering from ^{42}Ca and ^{44}Ca made at NIKHEF-K are also being analyzed. These data are being analyzed in conjunction with data obtained previously at the Bates Linear Accelerator. Initial electron scattering measurements of 4/sup {minus/} excitations in ^{18}O were performed at Bates. Results of previous measurements of ^{16}O and ^{17}O were published. Preparations for experiments at the Saskatchewan Accelerator Laboratory (SAL) and at NIKHEF-K have also been made. The feasibility of performing electron scattering experiments from polarized targets in the SAL storage ring was examined and a proposal for funding of target construction submitted to the U.S. DOE under the University Research Instrumentation Program. Design of a spectrometer is underway. 21 refs., 5 figs.

6516 Nuclear Properties And Reactions, A=59-89, Experimental

38550 (INFN/BE—86-2) Gamma decay of excited complex fragments emitted in the reaction ^{20}Ne+^{60}Ni at 742 MeV. D'Onofrio, A.; Delaunay, B.; Delaunay, J.; Dumont, H.; Gomez del Campo, J.; Bruandet, J.F.; Brondi, A.; Moro, R.; Romano, M.; Terrasi, F. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1986. 6p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702089/JAW.

From the observation of excited ^{7}Li and ^{7}Be fragments at backward angles (120 grade centigrades and 150 grade centigrades) in the reaction Ne+Ni at 742 MeV, an emission temperature compatible with that inferred from the slope of particle energy spectra has been obtained. The use of a high resolution Compton suppressed gamma-ray detector has played a crucial role.

38551 Possible evidence for neutrinoless $\beta\beta$-decay with the emission of majorons. Avignone, F.T. III; Brodzinski, R.L.; Miley, H.S.; Reeves, J.H. (Pacific Northwest Lab., Richland, WA (USA)). pp 3 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—).

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

An ultralow background, 135 cm^3 prototype detector has been operated underground for 402 days of counting. The background from primordial radioactivity was lower by factors between 1.5 x 10^3 and 2.5 x 10^4 when compared to commercial low-background detectors. Data from this and from other ^{76}Ge $\beta\beta$-decay experiments were combined in a single spectrum and analyzed for neutrinoless $\beta\beta$-decay with the emission of electrons only. The maximum likelihood 68%-C.L. values for the half-life and Majorana nu mass are 4.1 x 10^{23} yr and 2.4 eV, respectively. The energy spectrum of their detector shows evidence of a shoulder in the vicinity of the $\beta\beta$-decay Q-value which does not fit any probable background scenario. If attributed to neutrinoless $\beta\beta$-decay with Majoron emission, the net count rate corresponds to T$_1$2 = (6 +- 1) x 10^{20} yr and coupling constant g/sub ee/ = (8 +- 1) x 10^{-4}. They are presently attempting to confirm these results with an improved experiment.

6517 Nuclear Properties And Reactions, A=90-149, Experimental

38552 (AD-A—190275/8/XAB) SDIO/IST ultrashort wavelength laser: novel experimental schemes for observing the Moessbauer effect in long-lived nuclear levels. Final report for period ending 31 March 1987. Hoy, G.R. (Old Dominion Univ., Norfolk, VA (USA). Dept. of Physics). Jul 1987. 26p. (PTR—87-6). NTIS, PC A03/MF A01.

The development of gamma-ray lasers (GRASERS) will, in all probability, depend on the utilization of recoillessly emitted gamma rays from nuclear transitions, i.e. the Moessbauer effect (ME). Past research in Moessbauer spectroscopy which relates to GRASERS is briefly reviewed. The nuclear lifetimes, required from practical considerations, may have to be on the order of seconds, if storage and transfer processes prove infeasible. It is not clear that the ME has been observed in such long-lived states. Even if such long-lived states are not needed directly for GRASERS, successful observation of the ME in such a system will answer important questions of line broadening due to field inhomogeneities in single crystals. The author proposes some novel experimental schemes to observe the ME in ^{109}Ag whose relevant lifetime is about 40 seconds. The techniques proposed are: coincidence Moessbauer spectroscopy, conversion-electron Moessbauer spectroscopy, gravitational line sweeping, and gamma-ray self-absorption. Preliminary results using the last technique are presented. Possible future, relevant ME research is discussed.

38553 (CENBG—8713) Measurement of lifetime of Sb high spin states populated by emission of three protons in the reaction ^{58}Ni + ^{54}Fe at 4 MeV by nucleon. Hiel, A. (Bordeaux-1 Univ., 33 - Gradignan (France). Centre d'Etudes Nucleaires). Jul 1987. 117p. (In French). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88753939/JAW.

The life time of nuclear excited states populated by the ^{112}Xe compound nucleus and corresponding to the 4 Protons and (alpha, 2 protons) reaction channels was experimentally reached by means of the so called "atomic clock method". This method is based on the comparaison between the known lifetime of an inner atomic hole created on the way into the nuclear fusion reaction (^{58}Ni + ^{54}Fe at 4 MeVA) and the nuclear life time to be measured. On line coincidences performed between the gamma rays of a given evaporation residue (ER) and the emitted X rays enable the selection of the atomic vacancies decaying during different steps of the deexcitation channel. Taking advantage of the long lived nuclear converted transitions and using the Doppler shift method, the spurious contamination in the X rays spectrum associated with decay by internal convertion of the nuclear final states is avoided. The main characteristics of this technique are illustrated by measurements for the first time of: - average life time of intermediate nucleus (Sb) in the 4p) reaction channel. This life time was found equal to (7+-4) 10^{-17}s, when the excitation energy of the corresponding ER is lying between 12 and 25 MeV, - a nice dependence of the nuclear life time on the angular momentum and excitation energy of the residual nucleus.

38554 (DOE/ER/40345—1) Triple angular correlations in the decay of /sup 110m/Ag: Annual report. Krane, K.S.; Schulz, N.S. (Oregon State Univ., Corvallis (USA). Dept. of Physics). [1987]. Contract FG06-87ER40345. 27p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009681/JAW.

Double and triple gamma-ray angular correlations are reported for cascades in ^{110}Cd following the decay of ^{110}Ag. The 764-1505-658 keV triple correlation helps to resolve a long-standing ambiguity concerning the E2M1 multipole mixing ratio of the 1505-keV transition. The potential of triple correlations to contribute to nuclear spectroscopy is thereby demonstrated. 12 refs., 8 figs., 1 tab.

38555 (DOE/ER/40345—6) Angular correlations of gamma rays in the decay of ^{109}Pd and ^{111}Pd. Brown, D.E. (Oregon State Univ., Corvallis (USA)). 23 Sep 1987. Contract FG06-87ER40345. 79p. NTIS, PC A05;3. Order Number DE88009577/JAW.

In this work, angular correlation techniques have been used to determine the mixing ratios of several γ-transitions in ^{109}Ag and ^{111}Ag and to make some spinparity assignments for some of the levels in these nuclei. The choice of these two isotopes for study in this work was made for three main reasons: (1) lack of existing information on the electromagnetic properties of these nuclei; (2) unexpectedly large M2E1 mixing ratios had been measured in Bosch et al. and required verification and; (3) the possibility of testing a particle-rotor model, due to De-Shalit, whereby ^{109}Ag and ^{111}Ag can be described as a single p_12 proton coupled to a deformed, even-even core. Zeghib et al. have had considerable success in applying this model to ^{111}Ag recently. More data is needed on level structure and mixing ratios to test fully the validity of this model. In the following, a brief description of the theory of angular correlations is given. Then a detailed description of the automatic data acquisition system for the spectrometer is given. This system was designed specifically to meet the needs of this experiment. Finally, the results of the studies of the two isotopes of interest are detailed. 16 refs., 19 figs., 9 tabs.

38556 (GSI—87-83-Prepr.) Gamow-Teller beta decay of neutron-deficient even isotopes of tin. Barden, R.; Kirchner, R.; Klepper, O.; Rathke, G.E.; Roeckl, E.; Schardt, D.; Plochocki, A.; Rykaczewski, K.; Zylicz, J. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Warsaw Univ. (Poland). Inst. Fizyki Doswiadczalnej). Dec 1987. 28p. Also published in Z. Phys., A: At. Nuclei (Mar 1988) Vol. 329(3) p. 319-330.

With the use of the ^{58}Ni + ^{50}Cr fusion-evaporation reaction and chemically selective on-line mass separation, the ECβ^+ decay of ^{104}Sn was studied by γ-ray and conversion-electron spectroscopy. In the course of these studies, a new 15.7-s isomeric state of ^{104}In was observed. Reinvestigation of the β-decays of the two heavier even isotopes of tin, produced in the ^{58}Ni + ^{58}Ni reaction and mass separated without chemical discrimination, brought new information on the decay of ^{106}Sn and ^{108}Sn. The Q/sub EC/ values of ^{104}Sn, ^{106}Sn and ^{108}Sn were determined to be 4550(+300-250) keV, 3200 +- 100 keV and < 2270 keV, respectively. In the data analysis, the emphasis is put on the identification of the $0^+ \rightarrow 1^+$ Gamow-Teller β transitions and determination of their strengths. For $^{104-110}$Sn, the total Gamow-Teller strengths are measured to be 20% to 30% of that predicted by the single-particle shell model with the inclusion of pairing correlations and core polarization. Predictions of the decay properties of the as yet unobserved ^{103}Sn and ^{100}Sn are made.

38557 (INIS-mf—11721) Interactions of collective and particle excitations in the nucleus ^{138}Ce. Schmittgen, K.P. (Koeln Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 7 Feb 1987. 87p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753557/JAW.

The nucleus ^{138}Ce was produced by the compound-nucleus reactions ^{139}La(p,2n), E/sub p/ = 18-27 MeV, ^{136}Ba(α,2n), E/sub α/ = 24-25 MeV, and ^{124}Sn(^{16}O,4n), E/sub O/ = 62-74 MeV. By means of these reactions each γ-γ coincidences, angular distributions, conversion electrons, and excitation functions (except the (α,2n) reaction) were measured. A term scheme resulting from these measurement was established. 14 new states and 10 new spins below 3.5 MeV and 13 new states and 6 new spins above 3.5 MeV were determined. A life-time measurement was performed with the (p,2n) reaction at 18 MeV. New isomers with half-lives between 3 ns and 50 ns could not be detected. By means of angular distribution, conversion and excitation function spin and parity of the level at 3539 keV could be fixed to 10^+. By this a reduced transition probability for the 430-keV transition from the 3539-keV level to the 3109-keV level of B(E2) = 0.46(1) $e^2(fm)^4$ respectively 0.01 Weisskopf units results. By means of a Coulomb excitation the reduced transition probability of the ground-state transition in ^{138}Ce was determined to B(E2) = 910(70)$e^2(fm)^4$. (orig.HSI).

38558 (JINR-R—6-87-478) Differences of the nuclear charge radii of rare earth elements with even and odd numbers of neutrons. Gangrskij, Yu.P.; Zemlyanoj, S.G.; Kul'dzhanov, B.K. and others. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions; AN Uzbekskoj SSR, Tashkent. Inst. Yadernoj Fiziki). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions). 1987. 7p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702935/JAW.

Submitted to the journal Izv. AN SSSR.

Isotope shifts in optical spectra of Nd, Sm and Gd atoms have been investigated. The experimental method was based on resonance fluorescence of the investigated atoms. The tunable dye-laser was used for atom excitation. Changes in mean-square nuclear charge radii for odd and even rare-earth nuclei were extracted from reported isotope shifts. The dependence of nuclear charge radii odd-even differences on neutron number is discussed. 15 refs.; 1 fig.; 4 tabs.

38559 (LBL—24275) Subthreshold pion production in the reaction ^{139}La + ^{139}La $\rightarrow \pi^{+-}$ + X. Miller, J. (Lawrence Berkeley Lab., CA (USA)). Jan 1988. Contract AC03-76SF00098;AS05-76ER04699. 222p. NTIS, PC A10/MF A01;1; GPO Dep. Order Number DE88008228/JAW.

We have measured charged pion production in the reaction ^{139}La + ^{139}La $\rightarrow \pi^{+-}$ + X at three beam energies (246, 183 and 138 MeVnucleon) below the nucleon-nucleon threshold. Associated multiplicity for charged participants was obtained using a 110-element scintillator multiplicity array. Data were taken over the angular range of 21{degree} to 67{degree} in the laboratory (equivalent to 30{degree} to 90{degree} in the center of mass). Dependence of the spectra upon pion charge, energy and angle, beam energy, system mass and associated multiplicity was investigated. Based on the isotropic angular distibutions and the associated multiplicities for pion production, it appears that subthreshold pions in the range of our experiment are produced predominantly from a source at rest in the center of mass and involving a large number of nucleons. The general character of the subthreshold pion spectra is comparable to previous results above threshold. However, the scaling of the subthreshold pion yield with system mass deviates from the dependence observed in light systems, to an extent which cannot be explained by a simple nucleon-nucleon model. We also found charge dependent structure in the pion spectra, which we analysed in the framework of both Coulomb distortion and clustering models. We conclude that while we did not find clear evidence of collective effects in subthreshold pion production, it would be very worthwhile to conduct a systematic investigation of pion production for all charge states and over a range of angles, system masses and beam energies, below threshold. 170 refs., 78 figs., 10 tabs.

38560 (LBL—25233) New limit on the neutrinoless double beta decay of ^{100}Mo. Krivicich, J.M. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 118p. NTIS, PC A06/MF A01; 1; GPO Dep. Order Number DE88011908/JAW.

A search for the neutrinoless double beta decay of ^{100}Mo was conducted using thin Mo films and solid state Si detectors. The experiment has collected 3500 hours of data operating underground in a deep silver mine (3290 M.W.E.). Only one event was found to be consistent with neutrinoless double beta decay. Using this one event, a limit of $\geq 1 \times 10^{22}$ years (1 σ) is set on the ^{100}Mo half-life. This is approximately five times larger than the best previous ^{100}Mo limit.

38561 Deformation-driving properties of the *vi*/sub 13/2/ [660](1/2$^+$ intruder orbital for A$\sim$130 nuclei. Paul, E.S.; Ma, R.; Beausang, C.W.; Fossan, D.B.; Piel W.F. Jr.; Shi, S.; Xu, N.; Zhang, J. (Department of Physics, State University of New York at Stony Brook, Stony Brook, New York 11794). *Physical Review Letters;* **61**: No. 1, 42-45(4 Jul 1988).

Several rotational-band structures have recently been observed in mass A$\approx$130 nuclei, built on multiquasiparticle states of enhanced quadrupole deformation, the so-called superdeformed states ($\beta \approx 0.4$). In /sup 137/Sm, a decoupled band built on the *vi*/sub 13/2/[660](1/2$^+$ single-quasineutron orbital, intruding from two

oscillator shells above with a predicted $\beta \cong 0.35$, was observed to low spin and excitation energy. The role of this β-driving $\nu i_{13/2}$ orbital, which showed a 50% enhanced moment of inertia, is discussed in terms of the superdeformation in this mass region.

38562 Evidence for superdeformation in ^{148}Gd. Drigert, M.W.; Garg, U.; Janssens, R.V.F.; Holzmann, R.; Chasman, R.R.; Ahmad, I.; Dichter, B.K.; Emling, H.; Khoo, T.L.; Ma, W.C. (Notre Dame Univ., IN (USA);Argonne National Lab., IL (USA)). *Physics Letters [Section] B;* 201: No. 2, 223-227(4 Feb 1988). Contract AC02-76ER01672;W-31-109-ENG-38.

γ-γ transition energy correlation measurements were performed in ^{148}Gd using Compton-suppressed Ge detectors. A broad first-ridge was observed for $1.00 < E_\gamma < 1.42$ MeV. The deduced moment of inertia $\phi^{(2)} = 78$ Planck constant^2 MeV^{-1} is consistent with superdeformation in ^{148}Gd. The results can be explained by cranked Strutinsky calculations.

38563 (BNL—41121) Transverse energy distribution, charged particle multiplicities and spectra in ^{16}O--nucleus collisions. Sunier, J.W. (Brookhaven National Lab., Upton, NY (USA)). 26 Nov 1987. Contract AC02-76CH00016. 8p. (CONF-8708166—5). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009847/JAW.

From 6. international conference on ultra-relativistic nucleus-nucleus collisions; Nordkirchen, F.R. Germany (24 Aug 1987).

The HELIOS (High Energy Lepton and Ion Spectrometer) experiment, installed at the CERN Super Proton Synchrotron, proposes to examine in detail the physical properties of a state of high energy created in nuclei by ultra-relativistic nucleus-nucleus collisions. It is generally believed that, at high densities or temperatures, a phase transition to a plasma of quark and gluons will occur. The dynamic of the expansion of such a plasma and its subsequent condensation into a hadron gas should markedly affect the composition and momentum distribution of the emerging particles and photons. The HELIOS experimental setup therefore combines 4π calorimetric coverage with measurements of inclusive particle spectra, two particle correlations, low and high mass lepton pairs and photons. The emphasis is placed on transverse energy flow (E_T) measurements with good energy resolution, and the ability to trigger the acquisition of data in a variety of E_T ranges, thereby selecting the impact parameter or the violence of the collisions. This short note presents HELIOS results, for the most part still preliminary, on ^{16}O--nucleus collisions at the incident energies of 60 and 200 GeV per nucleon. The E_T distributions from Al, Ag and W targets are discussed and compared to the associated charged particle multiplicities from W. Charged particle and (converted) photon spectra measured with the external magnetic spectrometer are compared for ^{16}O + W and p + W collisions at 200 GeV per nucleon.

38564 (CONF-880260—7) Experimental studies of quasi-fission reactions. Back, B.B.; Glagola, B.G.; Henderson, D.; Kaufman, S.B.; Keller, J.G.; Sanders, S.J.; Videbaek, F.; Wilkins, B.D. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009967/JAW.

From 5. winter workshop on nuclear dynamics; Sun Valley, ID, USA (22 Feb 1988).

A large body of experimental data on these fission-like processes have become available in recent years using a number of different target-projectile combinations. None of these experimental studies are specifically addressing the question of entrance channel effects. These effects are expected to play an important role if the dynamics in the approach phase of the reaction is responsible for the occurrence of quasi-fission. An alternate interpretation in terms of the disappearance of the fission barrier at large partial waves, which is entirely a property of the completely fused system independent of the formation process, has also been proposed. In order to address these questions we have studied the system ^{214}Th via three different entrance channels, namely ^{32}S{plus}^{182}W, ^{48}Ti{plus}^{166}Er and ^{60}Ni{plus}^{154}Sm. The analysis of the ^{48}Ti{plus}^{166}Er data is, as yet, incomplete and we shall therefore report only on the results of the ^{32}S{plus}^{182}W and ^{60}Ni{plus}^{154}Sm reactions in this paper. 4 refs., 3 figs.

38565 (CONF-880260—10) Very-high energy (E → E/sub beam/) light particle production near 0° in heavy-ion collisions, E/A ≦ 40 MeV/u. Shaheen, S.; Becchetti, F.D.; Roberts, D.; Jaenecke, J.; Schulman, P.; Stern, R.; Nadasen, A.; Kovar, D. (Michigan Univ., Ann Arbor (USA). Dept. of Physics; Michigan Univ., Dearborn (USA). Dept. of Natural Sciences; Argonne National Lab., IL (USA)). Feb 1988. Contract W-31-109-ENG-38. 4p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011985/JAW.

From 5. winter workshop on nuclear dynamics; Sun Valley, ID, USA (22 Feb 1988).

Studies of heavy-ion collisions at E/A ~ 10 MeV/u to 20 MeV/u with the production of nucleons and other particles at forward angles with velocities several times that of the projectile have been observed by many groups (TAM, ORNL, MSU, HMI). This is usually attributed to projectile fragmentation with Fermi motion of the light particle which is often described by a source temperature T_s, accounting for the additional velocity component. However, experiments reported by Borcea et al. and those done at the Hahn-Meitner Institute (VIKSI) have suggested that high-energy alpha particles observed near theta = 0° in ^{20}Ne-induced collisions, E/A ≦ 20 MeV/u, may arise from mechanisms such as cluster transfer reactions. Here we report observation of a similar phenomenon with a variety of projectiles (Z ≧ 8), E/A = 9 to 40 MeV/u.

38566 (DOE/ER/40109—6) Quadrupole moments and g-factors of low-lying bands in odd-A-nuclei (150 < A < 190). Rieckert, V. (Oregon State Univ., Corvallis (USA). Dept. of Physics). 8 Sep 1987. Contract AT06-83ER40109. 102p. NTIS, PC A06;3. Order Number DE88010190/JAW.

The static and dynamic electric quadrupole moments of even-even and odd-A nuclei with 150 < A < 190 have been compiled and analyzed in a systematic way, in order to extract the best set of intrinsic quadrupole moments Q_0. The intrinsic quadrupole moments of the odd-A nuclei have been used together with a compilation of static and transitional magnetic dipole moments of those nuclei to deduce a consistent set of collective rotational g-factors g_R and intrinsic g-factors g_K. A comparison between the rotational g-factors obtained from this compilation and theoretical values based on the cranking model shows good agreement between the two. The intrinsic g-factors have been compared with an estimate based on the Nilsson wave functions, and effective spin g-factors have been extracted. The latter display a spread of values somewhat larger than predicted by a previous calculation of the spin polarization effect. 26 refs., 10 figs., 9 tabs.

38567 (IPNO-DRE—87-34) Structure of doubly-odd nucleus ^{184}Ir from the decay of ^{184}Pt. Ben Braham, A.; Bourgeois, C.; Kilcher, P.; Roussiere, B.; Sauvage, J.; Kreiner, A.J.; Porquet, M.G. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1987. 29p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753484/JAW.

States of ^{184}Ir populated through the β^+EC decay of ^{184}Pt, were studied using mass-separated sources and on-line γ-ray and e^- spectroscopy techniques. A rather complete low-spin level scheme is established. Negative and positive parity structures are interpreted within the two-quasiparticle-plus-rotor model.

38568 (JINR—E-1-87-350) Target residues from the reactions of 9 GeVc protons and deuterons with ^{181}Ta. Kozma, P.; Kliman, J.; Leonard, M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 14p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702131/JAW.

Submitted to the journal Czech. J. Phys. B.

The production of radioactive nuclides in the reactions of 9 GeVc protons and deuterons with ^{181}Ta has been investigated at the Dubna synchrophasotron. The production cross section of target fragments with 24 ≦ A ≦ 178 were determined by off-line

gamma-ray spectroscopy. Charge dispersions and mass yields are deduced from these data. The results are discussed in terms of the concepts of high-energy nuclear physics. 15 refs.; 6 figs.; 5 tabs.

38569 **(JINR-R—1-87-442) Two-proton correlations and sizes of proton emission region in pTa interactions at 10 GeV/c.** Agakishiev, G.N.; Armutlijski, D.D.; Akhababyan, N.O. and others. (AN Azerbajdzhanskoj SSR, Baku. Inst. Fiziki; Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy; Bylgarska Akademiya na Naukite, Sofia. Inst. za Yadrena Izsledvaniya i Yadrena Energetika). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702924/JAW.

Submitted to the journal Sov. J. Nucl. Phys. .

Two-particle correlations between secondary protons with small relative momenta in pTa interactions are studied in order to obtain the values of radius of their emission region at initial momentum of 10 GeVc. The results were compared with those on two-proton correlations in interactions of light nuclei. A=8(p, d, a, C) with carbon nuclei. The radii of proton emission region are determined for different intervals of average total and transverse momenta of proton pairs. As a result of comparing the sizes of the emission regions of protons from pTa and pA interactions it turned out that for <p>/sub min/ >or approx. 0.4 GeVc (<p>/sub min/=12chemical bondp-vector$_1$+p-vector$_2$chemical bond/sub min/) the radii of the emission region are less than those of target nuclei and they coincide for both types of interactions. This result might be an indication to the emission of fast protons resulting from the interaction of the projectile with a definite part of target-nucleus which weakly depends on the size of a projectile. 13 refs.; 7 figs.; 3 tabs.

38570 **(UCRL—97891-Rev.1) Measurement of atomic oscillator strengths using pulsed single frequency dye lasers.** Haynam, C.; Comaskey, B.; Johnson, M.; Paisner, J.; Worden, E. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 8p. (CONF-880435—20-Rev.1). NTIS, PC A02;3. Order Number DE88011350/JAW.

From 4. international symposium on resonance ionization spectroscopy and its applications; Gaithersburg, MD, USA (10 Apr 1988).

We have used two methods to measure the oscillator strength of the transition between the ground and 17992 cm/sup {minus/1} level in ^{174}Yb. In the first technique we observe the population oscillations of a two-level system due to resonant laser excitation. The measurement of the oscillation frequency vs integrated laser electric field or pulse area allows determination of the transition oscillator strength. The second method is similar to the inverse hook method developed by Wijngaarden et al. The measurement of the population oscillation versus laser fluence and detuning permits the determination of oscillator strength. In both cases two-step photoionization is used to detect excited state population variations. 5 refs., 14 figs.

38571 **Structural changes along and above the yrast line of /sup 154/Dy.** Ma, W.C.; Quader, M.A.; Emling, H.; Khoo, T.L.; Ahmad, I.; Daly, P.J.; Dichter, B.K.; Drigert, M.; Garg, U.; Grabowski, Z.W.; and others. (Argonne National Laboratory, Argonne, Illinois 60439). *Physical Review Letters;* **61**: No. 1, 46-49(4 Jul 1988).

States in /sup 154/Dy have been located up to I/sup π/ = 48^+ and their lifetimes measured. Marked structural changes occur along the yrast line with a transition from prolate to oblate shape, followed by an unexpected return to moderate collectivity at the highest spins. Structural changes with increasing energy above the yrast line are also observed.

38572 **(CONF-880260—4) Results from CERN experiment WA80.** Plasil, F.; Albrecht, R.; Awes, T.C.; Baktash, C.; Beckmann, P.; Berger, F.; Bock, R.; Claesson, G.; Dragon, L.; Ferguson, R.L. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 6p. (CONF-880260—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008372/JAW.

From 5. winter workshop on nuclear dynamics; Sun Valley, ID, USA (22 Feb 1988).

The two primary goals of the WA80 collaboration are to survey nucleus-nucleus collisions at 60 and 200 GeVnucleon and to compare the results to those obtained from proton-nucleus interactions and to search for evidence that a quark-gluon plasma has been formed or that some similar phase transition has taken place. One of the ways to pursue the first goal is by means of forward and transverse energy measurements. These relate to important quantities such as the degree of nuclear stopping, the magnitude of attained energy densities, and the level at which collective effects manifest themselves. These measurements and their interpretation were discussed during the oral presentation at this meeting for both ^{16}O- and ^{32}S-induced reactions. Since the ^{16}O results are now published, we present here only the preliminary unpublished ^{32}S transverse energy distributions. In addition, we show sample results obtained with the single-arm photon spectrometer, SAPHIR, and with the Plastic Ball. 8 refs., 3 figs.

38573 **(CONF-8806117—3) Excitation and photon decay of giant multipole resonances - the role and future of medium-energy heavy ions.** Bertrand, F.E.; Beene, J.R.; Horen, D.J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 25p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011842/JAW.

From 3. international conference on nucleus nucleus collisions; Saint-Malo, France (6 Jun 1988).

Inelastic scattering of medium energy heavy ions provides very large cross sections and peak-to-continuum ratios for excitation of giant resonances. For energies above about 50 MeV/nucleon, giant resonances are excited primarily through Coulomb excitation, which is indifferent to isospin, thus providing a good probe for the study of isovector giant resonances. The extremely large cross sections available from heavy ion excitation permit the study of rare decay modes of the photon decay of giant resonances following excitation by 22 and 84 MeV/nucleon ^{17}O projectiles. The singles results at 84 MeV/nucleon yield peak cross sections for the isoscalar giant quadrupole resonance and the isovector giant dipole resonance of approximately 0.8 and 3 barns/sr, respectively. Data on the ground state decay of the isoscalar giant quadrupole and isovector giant dipole resonances are presented and compared with calculations. Decays to low-lying excited states are also discussed. Preliminary results from an experiment to isolate the ^{208}Pb isovector quadrupole resonance using its gamma decay are presented.

38574 **(GSI—87-59-Prepr.) On the production of superheavy elements and the limitations to go beyond.** Armbruster, B. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Sep 1987. 45p. (CONF-8706234—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753377/JAW.

From International school of physics Enrico Fermi: course on trends in nuclear physics; Varenna, Italy (23 Jun 1987).

The work I present has been achieved by a group of physicists, the 'SHIPPERS' of GSI Darmstadt working together since about 10 years. All the experiments are performed using the strong beam of the 'UNILAC' accelerator to produce evaporation residues (EVR), the velocity selector 'SHIP' to separate the EVR's from the primary beam, and an implantation technique allowing to indentify single atoms by their α-decay genetics. A comprehensive review of our work was given recently. (orig./HSI).

38575 **(GSI—87-82-Prepr.) Photon and neutral pion distributions in 60 and 200 A.GeV ^{16}O + nucleus and proton + nucleus reactions.** Albrecht, R.; Bock, R.; Claesson, G.; Gutbrod, H.H.; Kolb, B.W.; Lund, I.; Schmidt, H.R.; Siemiarczuk, T.; Awes, T.C.; Baktash, C. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Oak Ridge National Lab., TN (USA); Muenster Univ. (Germany, F.R.); Lawrence Berkeley Lab., CA (USA); Lund Univ. (Sweden); Tennessee Univ., Knoxville (USA)). Dec 1987. 16p. Also published in Phys. Lett., B (11 Feb 1988) v. 201(3) p. 390-396.

Transverse momentum (p/sub T/) distributions of inclusive photons and neutral pions at midrapidity are measured with a lead glass calorimeter in 60 and 200 A.GeV ^{16}O + nucleus and proton + nucleus reactions. The variation of the average transverse momentum is investigated as function of centrality, determined by measurements of the remaining energy of the projectile and the charged particle multiplicity. For small values of the entropy, deduced from the multiplicity density, an increase in average p/sub T/ is observed levelling off for larger values of entropy. The target-mass and energy dependence of π^0 p/sub T/ distributions are presented.

38576 **(IPNO-DRE—87-37) High spin levels in the ^{199}Pb and ^{200}Pb isotopes.** Pautrat, M.; Lagrange, J.M.; Dionisio, J.S.; Vieu, C.; Vanhorenbeeck, J. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1987. 34p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753485/JAW.

The de-excitation of the ^{200}Pb and ^{199}Pb isotopes, produced through the $^{186}W(^{18}O\ 4n, 5n)$ reactions, is investigated using γ-ray and conversion electron spectroscopy. The conversion coefficients are measured and the multipolarities deduced for a great number of transitions. The e^--γ and γ-γ coincidences and the half-life measurements lead to several new levels in both level schemes: the ^{200}Pb one is extended up to nearly 7 MeV, where an isomer is found. The experimental results are compared to those of microscopic calculations, performed in a two or three quasi-particle approximation, using a surface delta interaction with a reduced pairing component.

6520 Nuclear Properties And Reactions, A=220 And Above, Experimental

38577 **(CONF-880546—14) R-matrix analyses of the ^{235}U and ^{239}Pu neutron cross sections.** Derrien, H.; de Saussure, G.; Larson, N.M.; Leal, L.C.; Perez, R.B. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France); Oak Ridge National Lab., TN (USA); Tennessee Univ., Knoxville (USA)). 1988. Contract AC05-84OR21400. 14p. (CONF-880546—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011015/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

The resonance parameter analysis code SAMMY was used to perform consistent resonance analyses of several ^{235}U and ^{239}Pu fission and capture cross section and transmission measurements up to 110 eV for ^{235}U and up to 1 keV for ^{239}Pu. The method of analysis, the measurement selection and the results are briefly outlined in this paper.

38578 **(INIS-mf—11719) Studies on the ternary fission of ^{252}Cf with the detector DIOGENES.** Schall, P. (Technische Hochschule Darmstadt (Germany, F.R.). Inst. fuer Kernphysik). Jun 1987. 87p. (In German). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753555/JAW.

In this thesis on a measurement of the ternary fission of ^{252}Cf is reported. The relevant parameters for the mass determination energies and angles between the fragments were measured in coincidence. During a measurement time of 100 days 3 events were found in which each of the 3 angles between the fragments lies in an interval of 120^0 +- 20^0. Because these 3 events exhibited no symmetric mass distribution as upper limit for the ratio of symmetric ternary to binary fissions $< 2 \times 10^{-9}$ results. For the asymmetric ternary fission an upper limit of 8×10^{-8} was found.

38579 **(LA—10979-MS) Plutonium-241 half-life determination by high-resolution gamma-ray spectrometric measurement of $^{241}Pu/^{239}Pu$ ratios.** Likes, R.N.; Parker, J.L.; Goldman, A. (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 63p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010470/JAW.

A new method based upon high-resolution gamma-ray spectroscopy has estimated the half-life of ^{241}Pu to be 14.355 yr with a standard deviation of 0.004 yr. During a period of approximately 10 yr, quantities proportional to the $^{241}Pu/^{239}Pu$ mass raio were periodically determined by gamma-ray spectroscopy for 13 plutonium samples. Because spectra were acquired with both planar and coaxial germanium gamma-ray detectors, and because several mass ratios can be extracted from each gamma-ray spectrum, a total of 156 sets of time-dependent ratios were acquired, each yielding a half-life value. The procedure used to determine the time-dependent mass ratios makes them essentially independent of the size, shape, chemical composition, packaging, and isotopic distribution of the plutonium samples, and of the counting geometry including external filtering and of detector efficiency. The quoted result was obtained from a linear unweighted least-squares fit to all 156 sets of ratios comprising about 1000 data points, which was assumed to follow a fixed-effect, cross-classification analysis-of-covariance model. 7 refs., 19 figs., 5 tabs.

38580 **(LA—11151-MS) Background radiation from fission pulses.** England, T.R.; Arthur, E.D.; Brady, M.C.; LaBauve, R.J. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 81p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010184/JAW.

Extensive source terms for beta, gamma, and neutrons following fission pulses are presented in various tabular and graphical forms. Neutron results from a wide range of fissioning nuclides (42) are examined and detailed information is provided for four fuels: ^{235}U, ^{238}U, ^{232}Th, and ^{239}Pu; these bracket the range of the delayed spectra. Results at several cooling (decay) times are presented. For β^- and γ spectra, only ^{235}U and ^{239}Pu results are given; fission-product data are currently inadequate for other fuels. The data base consists of all known measured data for individual fission products extensively supplemented with nuclear model results. The process is evolutionary, and therefore, the current base is summarized in sufficient detail for users to judge its quality. Comparisons with recent delayed neutron experiments and total β^- and γ decay energies are included. 27 refs., 47 figs., 9 tabs.

38581 **Uncertainties of particle emission probabilities.** Browne, E. (Lawrence Berkeley Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research;* **265**: No. 3, 541-547(15 Mar 1988). Contract AC03-76SF00098.

This paper presents analytical methods for calculating uncertainties of particle emission probabilities, and shows how they are affected by decay-scheme normalization procedures. The equations have been derived with standard mathematical error-propagating techniques, using first-order approximations in Taylor series expansions of emission probabilities.

38582 **Measurement of 14.7 neutron-activation cross-sections for fusion.** Meadows, J.W.; Smith, D.L.; Bretscher, M.M.; Cox, S.A. (Argonne National Lab., IL (USA)). *Annals of Nuclear Energy;* **14**: No. 9, 489-497(1987).

The activation method has been used to measure 14.7 MeV cross sections for the following 21 reactions which are important for fusion-energy applications: $^7Li(n,n't)^4He$, $^{27}Al(n,p)^{27}Mg$, $^{27}Al(n,\alpha)^{24}Na$, $Si(n,X)^{28}Al$, $Ti(n,X)^{46}Sc$, $Ti(n,X)^{47}Sc$, $Ti(n,X)^{48}Sc$, $^{51}V(n,p)^{51}Ti$, $^{51}V(n,\alpha)^{48}Sc$, $Cr(n,X)^{52}V$, $^{55}Mn(n,2n)^{54}Mn$, $^{54}Fe(n,\alpha)^{51}Cr$, $Fe(n,X)^{56}Mn$, $^{59}Co(n,p)^{59}Fe$, $^{59}Co(n,2n)^{58}Co$, $^{59}Co(n,\alpha)^{56}Mn$, $^{58}Ni(n,2n)^{57}Ni$, $^{65}Cu(n,p)^{65}Ni$, $^{65}Cu(n,2n)^{64}Cu$, $Zn(n,X)^{64}Cu$, and $^{64}Zn(n,2n)^{63}Zn$. The results of this investigation are compared with corresponding recently evaluated cross-section values. Within the combined errors of the measured and evaluated results, the agreement is generally quite acceptable although some problem areas remain to be resolved. Significant improvements in the knowledge of the cross sections are achieved as a result of the present investigation for the reactions $Ti(n,X)^{47}Sc$, $^{59}Co(n,p)^{59}Fe$ and $^{65}Cu(n,p)^{65}Ni$. In the case of $^7Li(n,n't)^4He$, the present meas-

urement supports a recent evaluation in which a number of other n+^{7}Li processes were simultaneously considered in conjunction with neutron-induced tritium production.

38583 Heavy ion reactions with transplutonium elements. Hoffman, D.C. (Lawrence Berkeley Lab., CA (USA)). pp 30 of 194th national meeting of the American Chemical Society, Division of Nuclear Chemistry and Technology. Washington, DC; American Chemical Society (1987). (CONF-8708244—). Contract AC03-76SF00098.

From American Chemical Society Division of Nuclear Chemistry and Technology meeting; New Orleans, LA, USA (30 Aug 1987).

Fusion reactions between light heavy ions and heavy actinide targets have been widely used to make new transplutonium isotopes and to extend the known elements to atomic number 106. However, because of the rather high excitation energies of the compound nuclei produced in this way, severe losses from prompt fission and particle emission may occur, resulting in extremely small production cross sections for the desired products. Recently, transfer reactions between heavy ions and transplutonium element targets such as Cm-248, Bk-249, Cf-249, and Es-254 have been studied. Use of these targets together with the neutron-rich projectiles O-18 and Ne-22 has been shown to be a viable method for producing neutron-rich isotopes of elements up to 4 protons heavier than the target. However, extension of these studies to Ca-48 which has a still higher N/Z ratio, shows that it is no more effective than the lighter projectiles. Results of recent studies will be reviewed.

38584 (AD-A—190104/0/XAB) Square-well potential by an algebraic approach. Kais, S.; Levine, R.D. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Chemistry). Dec 1986. 7p. NTIS, PC A02/MF A01.

Pub. in Physical Review A, Vol. 34, No. 6, 4615-4620(Dec 1986).

This paper provides an algebraic approach to the celebrated quantum-mechanical problem of a particle in a box. There are two primary reasons for such a formulation. The first is that the potential and therefore the spectrum are quite anharmonic. Hence, simpler algebraic techniques were the Hamiltonian is one of the group generators, which lead to, at best, a quasi-harmonic spectrum, will just not work for this potential. Systematic methods are, in principle, available for handling anharmonic systems. Also, model algebraic Hamiltonians which are bilinear in the generators have recently been extensively employed in both nuclear and molecular physics. It is therefore of interest to see whether these techniques will work for this benchmark problem.

38585 (BNL—41259) Transition probabilities and static moments in transitional nuclei. Wolf, A.; Casten, R.F. (Israel Atomic Energy Commission, Beersheba. Nuclear Research Center-Negev; Brookhaven National Lab., Upton, NY (USA)). 1988. Contract AC02-76CH00016. 6p. (CONF-8804119—3). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88012132/JAW.

From International workshop on nuclear structure of the zirconium region; Bad Honnef, F.R. Germany (24 Apr 1988).

Electromagnetic transition probabilities and static moments of excited nuclear states are known to be good probes of nuclear structure. Therefore, a systematic analysis of the large amount of existing experimental data for these observables is expected to provide valuable information about the respective isotopes. It is the purpose of this talk to show that a combined analysis of static magnetic moments of 2_1^+ states and B(E2) transition probabilities for even-even nuclei can be used to obtain effective numbers of valence nucleons. This kind of information is of particular interest in cases where subshell closures are found. For example, it is well known that for the transitional nuclei in the A = 150 region the Z = 64 subshell is active when the number of neutrons N < 90, but disappears for N ≧ 90. A similar situation exists in the A = 100 region, where the Z = 38 subshell is active for N ≦ 58. In the following sections we present the method by which effective numbers of valence protons and neutrons can be deduced from B(E2) and g-factor data, and show applications of this method to the A = 150 and A = 100 transitional regions. Part of these results were recently published.

38586 (CONF-880386—6) Relativistic description of deformed nuclei. Price, C.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 11p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012033/JAW.

From International conference on spin-observables in nuclear physics; Telluride, CO, USA (14 Mar 1988).

The author has shown that relativistic Hartree calculations using parameters that have been fit to the properties of nuclear matter can provide a good description of both spherical and axially deformed nuclei. The quantitative agreement with experiment is equivalent to that which was obtained in non-relativistic calculations using Skyrme interactions. The equilibrium deformation is strongly correlated with the size of the spin-orbit splitting, and that parameter sets which give roughly the correct value for this splitting provide the best agreement with the quadrupole moments in the s-d shell. Finally, for closed shell +/- 1 nuclei, it was shown that the self-consistent calculations are able to reproduce the experimental magnetic moments. This was not possible in relativistic calculations which include only the effects of the valence orbital.

38587 (CONF-880546—16) Resonance parameter analysis with SAMMY. Larson, N.M.; Perey, F.G. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011405/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

The multilevel R-matrix computer code SAMMY has evolved over the past decade to become an important analysis tool for neutron data. SAMMY uses the Reich-Moore approximation to the multilevel R-matrix and includes an optional logarithmic parameterization of the external R-function. Doppler broadening is simulated either by numerical integration using the Gaussian approximation to the free gas model or by a more rigorous solution of the partial differential equation equivalent to the exact free gas model. Resolution broadening of cross sections and derivatives also has new options that more accurately represent the experimental situation. SAMMY treats constant normalization and some types of backgrounds directly and treats other normalizations and/or backgrounds with the introduction of user-generated partial derivatives. The code uses Bayes' method as an efficient alternative to least squares for fitting experimental data. SAMMY allows virtually any parameter to be varied and outputs values, uncertainties, and covariance matrix for all varied parameters. Versions of SAMMY exist for VAX, FPS, and IBM computers.

38588 (CONF-880766—1) Condensation of (e$^+$e/sup {minus/}) due to short-range, non-central attractive forces. Wong, Cheuk-Yin. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 3p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011018/JAW.

From 5. international conference on clustering aspects in nuclear and subnuclear systems; Kyoto, Japan (25 Jul 1988).

A discussion of quasi-stable composite e$^+$e/sup {minus/} interactions as an explanation for strong positron lines in heavy ion reactions is given. 4 refs., 1 fig.

38589 (CONF-880766—2) Interaction of a neutral composite particle with a strong Coulomb field. Wong, Cheuk-Yin. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 3p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011017/JAW.

From 5. international conference on clustering aspects in nuclear and subnuclear systems; Kyoto, Japan (25 Jul 1988).

The author discusses the interaction of the quasi-composite (e/sup {plus/}e/sup {minus/}) system with an external electromagnetic field. This problem addresses the question of the origin of strong positron lines in quasi-elastic heavy-ion reactions. 3 refs.

38590 (CONF-8804125—1) Drilling holes through nuclei, helium drops, and fermi cases. Pieper, S.C. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010014/JAW.

From Computational atomic and nuclear physics at one gigaflop conference; Oak Ridge, TN, USA (14 Apr 1988).

The probability of finding a specified number of nucleons in a cylinder passing through a nucleus is calculated by Monte Carlo techniques. The resulting distribution is compared to several analytical forms. The distributions are used to compute the distribution of transverse energy production in ultra-relativistic proton-nucleus collisions. 4 refs., 7 figs.

38591 (CONF-8805140—1) Origin of anomalous positron peaks in heavy-ion reactions. Wong, C.Y. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88011388/JAW.

From International conference on medium- and high-energy nuclear physics; Taipei, Taiwan (23 May 1988).

Unknown neutral objects, which decay into an electron and a positron with sharp energies, are found to be produced in heavy-ion reactions. The author discuss the possible origins of these objects and examine phenomenologically the consequences of a supercritical interaction between an electron and a positron due to their short-range non-central electromagnetic interactions. We study how an (e^+e^-) composite particle may be coupled to a strong nuclear Coulomb field.

38592 (CONF-8805140—3) Light-front dynamics of elastic electron-deuteron scattering. Coester, F. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 11p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012056/JAW.

From International conference on medium- and high-energy nuclear physics; Taipei, Taiwan (23 May 1988).

Measurements of the deuteron form factors over a wide range of momentum transfer can provide important clues to the role of subnucleon degrees of freedom in nuclear dynamics. For a meaningful calculation of the form factors it is essential that the current density operators and the deuteron wave function transform under Lorentz transformations in a mutually consistent manner. Standard nucleon-nucleon interactions can be used to construct unitary representations of the Poincare group on the two-nucleon Hilbert space. Deuteron wave functions represent eigenstates of the four-momentum operator. Existing parameterizations of measured single-nucleon form factors are used to construct a conserved covariant electromagnetic current operator. The light-front symmetry of the representation allows a clean separation of the effects of one- and two-body currents for arbitrary momentum transfers. Comparison with data indicates that for $Q^2 <$ GeV^2 the elastic cross sections are not dominated by two-body currents.

38593 (CONF-8805142—1) Nuclear dependence of parton distributions. Close, F.E. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 13p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011845/JAW.

From 3. conference on the intersections between particle and nuclear physics; Rockport, ME, USA (14 May 1988).

The author reviews the emerging information on the way quark, antiquark, and gluon distributions are modified in nuclei relative to free nucleons. He placed particular emphasis on Drell-Yan and phi production on nuclei and caution against premature use of these as signals for quagma in heavy-ion collisions.

38594 (CONF-8806167—1) How well do we understand quasi-elastic reactions at energies close to the barrier. Rehm, K.E. (Argonne National Lab., IL (USA)). 1988. Contract W-31-109-ENG-38. 12p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012012/JAW.

From Symposium on heavy ion interactions around the Coulomb Barrier; Padova, Italy (1 Jun 1988).

In collisions between too heavy nuclei a wide spectrum of different reaction modes is observed covering the range from simple processes like elastic scattering to complicated multistep transfers and fusion. On the theoretical side heavy ion reactions are usually analyzed using models that were developed first for light ion induced reactions: the optical model for elastic scattering and the DWBA for more inelastic processes like transfer and inelastic scattering. Some of the assumptions going into these approximations, however, are not valid for heavy ion induced reactions. The region between fusion and quasi-elastic reactions is not well understood theoretically. This region is associated with deep inelastic collisions, which are complex multiparticle reactions involving transfer of several protons and neutrons. In this paper, the author discusses to what extent experiments in the field of quasi-elastic scattering are understood within the framework of various theoretical models and in what areas more work is needed.

38595 (DOE/ER/40109—1) g/sub R/ and g/sub K/ factors in deformed nuclei. Krane, K.S.; Teich, W.G. (Oregon State Univ., Corvallis (USA). Dept. of Physics). 1984. Contract AT06-83ER40109. 14p. (CONF-8408123—3). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010194/JAW.

From International symposium on nuclear orientation and nuclei far from stability; Leuven, Belgium (28 Aug 1984).

The static and dynamic magnetic dipole moments of odd-mass and even-mass nuclei with $150 < A < 190$ have been compiled and analyzed in a systematic way, in order to extract the best set of collective rotational g-factors g/sub R/ and intrinsic g-factors g/sub K/. 2 refs., 4 tabs.

The detailed study of few-body systems provides one of the most sensitive tools for studying nuclear physics at subnucleon distance scales. For these systems the model equations can solved numerically with errors less than the experimental uncertainties. The author have used these systems to investigate the size of relativistic effects, the role of meson-exchange currents, and the importance of quark degrees of freedom in the nucleus. Detailed calculations of the electromagnetic form factors of the deuteron have been done using a front-form formulation of relativistic quantum mechanics. The structure of the most general Poincare covariant electromagnetic current operators and general tensor operators consistent with the dynamical constraints of special relativity was derived. The techniques for constructing scattering amplitudes for multiparticle

production reactions have been developed. We have completed a detailed study of the properties of the bound trinucleon system. The solution of the time-dependent Schroedinger in configuration space has been studied. Finally, new computational and analytic tools have been developed.

38599 **(EGG—2533) VAXGAP: A code for the routine analysis of gamma-ray pulse-height spectra on a VAX computer.** Killian, E.W.; Hartwell, J.K. (EG and G Idaho, Inc., Idaho Falls (USA)). May 1988. Contract AC07-76ID01570. 52p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011702/JAW.

This report describes the analysis algorithms and techniques used in the VAX Gamma-Ray Analysis Program (VAXGAP) at the Idaho National Engineering Laboratory (INEL). VAXGAP is a collection of computer programs for the analysis of gamma-ray pulse-height spectra. It operates on a Digital Equipment Corporation VAX computer, using the VMS operating system. Linear and nonlinear peak fitting techniques are used to calculate photopeak areas, which in turn are used to determine the concentration of gamma-ray emitting radionuclides in many different types of samples--from {open←quotes}hot{close←quotes} samples, collected from the primary coolant water of operating reactors, to very low-level environmental samples. VAXGAP is user friendly and provides laboratory technicians and spectroscopists with analysis results in a rapid and accurate manner with a minimal investment in computer hardware. On a VAX-750 computer, VAXGAP takes less than a minute to perform a typical spectrum analysis. VAXGAP programs are menu-driven and the user interface to the analysis functions is simple. Use of VAXGAP does not require a detailed knowledge of the computer operating system or gamma-ray spectroscopy. 3 refs., 5 figs., 4 tabs.

38600 **(GSI—87-57-Prepr.) Energetic particle emission from nuclear co-operation.** Knoll, J.; Shyam, R. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.); Saha Inst. of Nuclear Physics, Calcutta (India)). Sep 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753376/JAW.

We discuss different reaction mechanisms for the production of energetic particles like pions and photons in heavy ion collisions. Arguments from the uncertainty relation do not allow for a simple interpretation in terms of a single nucleon nucleon scattering mechanism (NNSC), and ask for a co-operative multi-nucleon process. Therefore, we analyze in more detail the implication of the co-operative model presented earlier. It takes into account the co-operation of many nucleons during the pion production process, and the formation of composite fragments along with the produced probe. The model is analyzed in terms of moving source parameters. Calculations are performed with the model and compared with recently measured data on pion production at a beam energy of 25 MeV/nucl.

38601 **(IFUSP-P—668) Comparison of the gaussian approximation and Langevin's simulation in DIC (Deep inelastic collisions).** Pato, M.P.; Oliveira, E.C. de; Gomes, L.C. (Sao Paulo Univ. (Brazil). Inst. de Fisica). Nov 1987. 22p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702271/JAW.

A numerical test is made of the Gaussian approximation to the Fokker-Planck equation for a Hamiltonian with two degrees of freedom and potentials and friction coefficients apropriate for the description of the deep inelastic collision of the system $^{90}A+^{232}Th$ at E sub (Lab)=279 Mev. The exact solution is constructed with the Langevin's simulation method. The failure of the Gaussian approximation is discussed and exhibit separately its sources from (i) diffusion coefficients, the linearization (ii) of the potentials and (iii) of the friction forces.

38602 **(IKDA—87/19) Three exit channels in the fission of $^{235}U(n,f)$.** Knitter, H.H.; Hambsch, F.J.; Budtz-Joergensen, C.; Theobold, J.P. (Technische Hochschule Darmstadt (Germany, F.R.). Inst. fuer Kernphysik; Commission of the European Communities, Geel (Belgium). Central Bureau for Nuclear Measurements). Jul 1987. 10p. Also published in Z. Naturforsch., A: Phys. Sci. (Aug 1987) Vol. 42(8) p. 786-790.

A formula for the fission fragment yield area in the coordinate system of the fragment total kinetic energy and of the fragment mass is presented. It was deduced along the lines of the multi-exit-channel model of fission elaborated by Brosa, Grossmann and Mueller. This formula was fitted to the fragment mass-, average total kinetic energy-, and variance distributions of the thermal neutron induced fission of ^{235}U. The obtained parameters are compared with the theoretical predictions. Further improvements of the fragment yield representation are discussed.

38603 **(INIS-BR—1018, pp 3) Percolation and nuclear fragmentation.** Chao, N.-C.; Chung, K.C. (Rio Grande do Norte Univ., Natal (Brazil). Dept. de Fisica Teorica e Experimental; Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro). 1987. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702601/JAW. (CONF-8711187—).

38604 **(INIS-mf—11219) 22nd Annual seminar on theoretical physics.** (Organization of Theoretical Physicists, Pretoria (South Africa); South African Inst. of Physics, Faure). 1987. 235p. (In English and Afrikaans). (CONF-8707166—). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW.

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

The 22nd Annual Seminar on Theoretical Physics, held from 14-17 July on the Durban campus of the University of Natal, could be described as very successful from a number of different considerations. Seventeen papers were delivered on the Seminar which covered a wide spectrum of theoretical physics with emphasis on quantum chromodynamics and nuclear theory.

38605 **(INIS-mf—11219, pp 61-72) Studies of the EMC-effect.** Engelbrecht, C.A.; Marais, S.C. (Institute for Theoretical and Nuclear Physics, University of Stellenbosch, South Africa). 1987. (In Afrikaans). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

It is shown that the broad features of the EMC-effect are adequately explained by the folding model in which average binding energy of nucleons and the appropiately normalized contribution of pions are taken into account.

38606 **(INIS-mf—11219, pp 121-134) Chiral soliton model of the nucleon.** Gavin, E.J.O.; Tegen, R.; Zimak, P. (Institute of Theoretical Physics and Astrophysics, University of Cape Town, South Africa; Basel Univ. (Switzerland). Inst. fuer Physik). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

We give a description of the nucleon in terms of a smooth chiral confinement model. Three quarks in their ground state interact via a scalar-isoscalar mean field, and this quark core is surrounded by a pion cloud in accordance with chiral symmetry. Using the measured g/sub A/g/sub V/ of the neutron and the 'helicity argument' (only fields which contribute to the helicity of the nucleon contribute to g/sub A/g/sub V/) we find that the resulting confining potential passes through a maximum and approaches its asymptotic value from above.

38607 **(INIS-mf—11219, pp 147-155) When is a symmetry - or, exposing dynamical symmetries of the interacting boson model from a non-U(6) angle.** Geyer, H.B.; Hahne, F.J.W.; Scholtz, F.G. (Institute of Theoretical Nuclear Physics, University of Stellenbosch, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

We show that dynamical symmetries other than the known U(5), SU(3) or O(6) limits of the interacting boson model can be identified for some choices of the boson Hamiltonian parameters. The recently discussed SO(7) symmetry is hereby completely accommodated within a boson framework. Our analysis shows that this symmety is in fact characterised by a U(5) boson Hamiltonian accompanied by choices of transition operators which differ from the traditional choices. A new selection rule associated with SO(7) is also identified.

38608 (INIS-mf—11219, pp 157-183) **Origin of the exchange term in the interacting boson-fermion model.** De Kock, E.A.; Geyer, H.B. (Institute of Theoretical Nuclear Physics, University of Stellenbosch, South Africa). 1987. NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702802/JAW. (CONF-8707166—).

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

Although a number of different types of boson-fermion interactions are possible in the interacting boson-fermion model, emperical results have shown that the exchange term is of cardinal importance. A recently constructed similarity transformation which reexpresses the Dyson boson images of the single-j shell fermion operators in terms of seniority bosons is used to show that the origin of the exchange term in spherical nuclei is intimately linked to the fermion quadrupole pairing interaction. The relative importance of the exchange and direct boson-fermion interactions is also discussed.

38609 (INIS-mf—11717) **System analytical studies on ground state properties of neutron-rich nuclides in the nuclear mass region A $\simeq$ 100. Application of the density functional method on a system of interacting bosons.** Toenhardt, M. (Technische Univ. Braunschweig (Germany, F.R.). Naturwissenschaftliche Fakultaet). 18 Jun 1987. 180p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88753553/JAW.

In this thesis only nuclei with even proton and even neutron number have been studied. This constraint allows to use a for the description of excitation spectra very successful model, the interacting boson model (IBM) and to combine this with the density functional method. From the obtained Hamiltonian via an energy-density functional an effective potential is constructed which can be applied in the framework of the density-functional method in order to calculate ground state energies and densities. From the density distributions radii and values for the static deformation are determined. As further ground state property the separation energy for two neutrons is studied. (orig./HSI).

38610 (INIS-mf—11720) **Statement of all scission-point configurations according to trajectory calculations on the example of the neutron-induced particle-accompanied fission of $_{92}$236U.** Kraske, F. (Technische Hochschule Darmstadt (Germany, F.R.). Inst. fuer Kernphysik). Jan 1987. 147p. (In German). NTIS (US Sales Only), PC A07/MF A01. Order Number DE88753556/JAW.

In the framework of the present thesis by comparison of the experimental measurement data obtained by means of the detector system DIOGENES with calculated trajectories possible scission-point configurations of the fissioning nucleus should be stated. Special interest was dedicated to the evaluation of the so-called particle-accompanied fission in which beside the two fission fragments yet a light particle is additionally emitted. The initial conditions of a fission searched for are obtained by means of trajectory calculations which yield for assumed starting values the physical quantities as result which are also experimental accessible like final energies of all three contributing particles and angle between the light particle and the light fragment. The calculations were performed both for spherical and for rotational-ellipsoidally deformed fragments. All calculations were performed including the Coulomb and nuclear interaction forces between the three contributing nuclei, the fission fragment, and the α particle. (orig./HSI).

38611 (INIS-mf—11722) **Proton-neutron degree of freedom in collective states of medium heavy nuclei.** Harter, H.J. (Koeln Univ. (Germany, F.R.). Mathematisch-Naturwissenschaftliche Fakultaet). 11 Jul 1987. 180p. (In German). NTIS (US Sales Only), PC A09/MF A01. Order Number DE88753558/JAW.

In this thesis the collective excitation forms of heavy nuclei are studied in the framework of the interacting boson model (IBM) which was developed by A. Arima and F. Iachello (1984). A description equivalent to the description of the dynamics of the surface is obtained in the IBM by the IBM-1 which not discriminates between protons and neutrons. The introduction of the proton-neutron degree of freedom occurs in the IBM-2 by the introduction of proton and neutron bosons. It is an essential aim of the present thesis to explain the apparent contradiction between the dominance of the proton-neutron interaction (IBM-2) and the phenomenological description power of the IBM-1 respectively to draw consequences from this. An essential mean for this is the introduction of the F spin which allows there application of the SU(2) group to the study of the Hamiltonian on its properties in connection with the proton-neutron exchange symmetry. The M1-transitions were used in order to study the purity of the F spin. In this connection the collective states of the nuclei ^{128}Xe and ^{168}Er could be consistently described in the energies, the B(E2) and the M1-transitions. (orig.HSI).

38612 (ITP—86-107) **Realization of Sp(4,R) model using the generating invariants technique.** Filippov, G.F. (AN Ukrainskoj SSR, Kiev. Inst. Teoreticheskoj Fiziki). 1986. 17p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702897/JAW.

The complete basis of the Sp(4,R) model for closed shells is constructed in the generating parameters space by means of the generating invariants techniques. Matrix elements of the multiparticle microscopic Hamiltonian are calculated between the basis functions of this model. 8 refs.

38613 (JINR—R-4-87-318) **Phenomenological description of nonadiabatic effects in deformed nuclei.** Mikhajlov, I.N.; Choriev, B.Ch. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 11p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702171/JAW.

Possibilities of a separation of interaction of bands with $\Delta K=0$ and 2 from the Coriolis interaction ($\Delta K=1$) are discussed. The spectrum is investigated and reduced probabilities of E2-transitions is deformed nuclei are studied in the framework of the phenomenological model with taking into account of strong mixing of the g-, β- and γ-bands. That yields the quality differences of dependence of B(E2)-factors on $\Delta I=I/sub f/(I/sub f/+1)-I/sub i/(I/sub i/+1)$ in comparison with Mikhailov formula. 12 refs; 7 figs.; 3 tabs.

38614 (JINR-E—4-87-467) **Deuteron polarizability and S-wave πid scattering at energies below 1 keV.** Pupyshev, V.V.; Solovtsova, O.P. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics; Gomel'skij Politekhnicheskij Inst. (Byelorussian SSR)). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702911/JAW.

Submitted to the journal Sov. J. Nucl. Phys. .

The influence of deuteron polarizability on the S-wave π^+d-scattering in a low-energy limit is explored in the framework of the variable phase method. It is shown that the nonoscillating part of the S-wave cross section of π^+d-scattering has a deep and sharp minimum in the energy region $\sim$ 0.4 keV. 15 refs.; 3 figs.; 1 tab.

38615 **(JINR-R—4-87-382) Charge-exchange reactions.** Gareev, F.A.; Ershov, S.N.; Pyatov, N.I.; Fayans, S.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Submitted to the Organizing Comittee in Intern. symposium "Newest achievements in nuclear physics", Novosibirsk, 27 Jun - 1 Jul 1987.

Review of nuclear spin investigations in (p,n)-reactions at intermediate energies is given. Problems of describing polarization characteristics and reaction mechanisms are considered. Experimental information on nuclear structure of discrete spin states and resonances in continuum, and its microscopic analysis in theory of finite Fermi systems are discussed. 24 refs.; 5 figs.; 1 tab.

38616 **(LA-UR—88-1645) Improved calculation of the prompt fission neutron spectrum from the spontaneous fission of ^{253}Cf.** Madland, D.G. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 23p. (CONF-880546—10). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010911/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

An improved calculation is presented for the prompt fission neutron spectrum N(E) from the spontaneous fission of ^{253}Cf. In this calculation the fission-spectrum model of Madland and Nix is used, but with several improvements leading to a physically more accurate representation of the spectrum. Specifically, the contributions to N(E) from the entire fission-fragment mass and charge distributions will be calculated instead of calculating on the basis of a seven-point approximation to the peaks of these distributions as has been done in the past. Therefore, values of the energy release in fission, fission-fragment kinetic energy, nuclear level density, and compound nucleus cross section for the inverse process will be considered on a point-by-point basis over the fragment yield distributions instead of considering averages of these quantities over the peaks of the distributions. Particular attention will be given to the energy-dependent compound nucleus cross sections and to the nuclear level density model. Other refinements to the calculation of N(E) will also be discussed. Results will be presented and compared with earlier calculations of the spectrum and with recent experimental measurements of the spectrum. 9 figs.

38617 **(LA-UR—88-1739) New developments in the GNASH nuclear theory code.** Arthur, E.D.; Young, P.G.; Kalbach, C. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 5p. (CONF-880546—11; CONF-880546—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010928/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

During the past year significant improvements have been made to the GNASH nuclear model code system that will be described in this paper. New features such as use of the Ignatyuk level-density model, inclusion of multistage preequilibrium reaction contributions, and approximations to Hauser-Feshbach models will be described and results illustrated. Of particular importance are models developed that describe gamma-ray emission competition relative to particle emission in full detail even for higher energy reaction processes. In addition to these model improvements, the code has been expanded to include up to 300–400 reaction paths in one calculation with options for simple, automatic problem setups. Also, a preliminary formulation of the Kalbach angular distribution phenomenology has been implemented that provides the capability for reasonably accurate calculations of double-differential cross sections and spectra. Calculational examples using the code options will be provided and comparisons to new higher energy neutron and proton measurements will be made. 12 refs., 5 figs.

38618 **(LBL—25024) Quasifragments: hot nuclei embedded in a nucleon vapor.** Fai, G.; Randrup, J. (Lawrence Berkeley Lab., CA (USA)). Mar 1988. Contract AC03-76SF00098. 5p. (CONF-880260—9). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011959/JAW.

From 5. winter workshop on nuclear dynamics; Sun Valley, ID, USA (22 Feb 1988).

In nuclear collisions at intermediate energies, metastable complex nuclear fragments are produced abundantly during the primary stage of the reaction. Therefore, statistical models for nuclear disassembly must incorporate highly excited unstable fragment states in the phase space considered. In our previous treatments of nuclear disassembly, a particular unstable fragment state was included in the final phase space provided its (estimated) half-life exceeded the time characterizing the breakup process. A similar prescription was also employed in the recent exact microcanonical model of nuclear disassembly. Although such life-time arguments are intuitively appealing in the context of a disassembling source, their relevance is less clear for the treatment of static problems, e.g. excited infinite nuclear matter at subsaturation densities. It is therefore desirable to seek a better foundation for the description of high excited nuclear states, applicable to both static and dynamical scenarios. This is also practically important for the implementation of event generators developed to provide samples of multi-fragment final states of medium-energy nuclear collisions. Furthermore, microscopic dynamical simulations also encounter the problem when seeking to give a realistic description of the final nuclear fragments.

38619 **(LBL—25322) Role of compound nuclei in intermediate-energy heavy-ion reactions.** Moretto, L.G.; Wozniak, G.J. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 16p. (CONF-8806117—4). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011921/JAW.

From 3. international conference on nucleus nucleus collisions; Saint-Malo, France (6 Jun 1988).

Hot compound nuclei are frequently produced in intermediate-energy reactions through a variety of processes. Their decay is shown to be an important and at times dominant source of complex fragments, high energy-gamma rays, and even pions.

38620 **(SLAC-PUB—4551) Topics in nuclear chromodynamics: Color transparency and hadronization in the nucleus.** Brodsky, S.J. (Stanford Linear Accelerator Center, Menlo Park, CA (USA)). Mar 1988. Contract AC03-76SF00515. 34p. (CONF-880331—6). NTIS, PC A03;3. Order Number DE88010679/JAW.

From 3. Lake Louise Winter Institute on quantum chromodynamics: theory and experiment; Lake Louise, Canada (6 Mar 1988).

The nucleus plays two complimentary roles in quantum chromodynamics: (1) A nuclear target can be used as a control medium or background field to modify or probe quark and gluon subprocesses. Some novel examples are color transparency, the predicted transparency of the nucleus to hadrons participating in high momentum transfer exclusive reactions, and formation zone phenomena, the absence of hard, collinear, target-induced radiation by a quark or gluon interacting in a high momentum transfer inclusive reaction if its energy is large compared to a scale proportional to the length of the target. (Soft radiation and elastic initial state interactions in the nucleus still occur.) Coalescence with co-moving spectators is discussed as a mechanism which can lead to increased open charm hadroproduction, but which also suppresses forward charmonium production (relative to lepton pairs) in heavy ion collisions. Also discussed are some novel features of nuclear diffractive amplitudes--high energy hadronic or electromagnetic reactions which leave the entire nucleus intact and give nonadditive contributions to the nuclear structure function at low {kappa←cur}/sub Bj/. (2) Conversely, the nucleus can be studied as a QCD structure. At short distances, nuclear wave functions and nuclear interactions necessarily involve hidden color, degrees of freedom orthogonal to the channels described by the usual nucleon or isobar degrees of freedom. At asymptotic momentum transfer, the deuteron form factor and distribution amplitude are rigorously calculable. One can also derive new types of testable scaling laws for exclusive nuclear amplitudes in terms of the reduced amplitude formalism.

38621 (UCRL—97948-Rev.1) Recent progress and current status of preequilibrium reaction theories and computer code ALICE. Blann, M. (Lawrence Livermore National Lab., CA (USA)). May 1988. Contract W-7405-ENG-48. 50p. (CONF-880342—1-Rev.1). NTIS, PC A03;3. Order Number DE88010617/JAW.

From International Centre for Physics workshop on applied nuclear theory and nuclear model calculations for nuclear technology application; Trieste, Italy (5 Mar 1988).

We review precompound decay theory with emphasis on implementation in the code ALICE. We discuss parameterizations of the hybrid model and sources of parameters. The importance of multiple preequilibrium decay is evaluated and illustrated. Applications to reactions with fission de-excitation are discussed, as well as methods of selecting parameters for actinide targets. 47 refs. 34 figs.

38622 Collapse of ring diagrams and nuclear-matter phase transitions. Jiang, M.F.; Heyer, J.; Yang, S.D.; Kuo, T.T.S. (Department of Physics, State University of New York at Stony Brook, Stony Brook, New York 11794). *Physical Review Letters;* **61**: No. 1, 38-41(4 Jul 1988).

We study a ring-diagram approach for nuclear matter where the particle-particle and hole-hole ring diagrams are calculated to all orders via a random-phase-approximation equation. This equation is found to have complex eigenvalues within a small temperature-density region, and our results suggest that this occurrence of complex eigenvalues may be a useful signal for nuclear-matter phase transitions. With a slightly modified Gogny interaction, our ring-diagram nuclear-matter calculations give rho$_0$ = 0.17 fm/sup -3/, E$_0$/A = -15.9 MeV, K = 127 MeV, and the liquid-gas critical temperature T/sub c/ = 7.6 MeV.

38623 Strong interacting probes for quark gluon plasma. Koch, P. (Brookhaven National Lab., Upton, NY (USA). Physics Dept.; State Univ. of New York, Stony Brook (USA). Dept. of Physics). *Zeitschrift fuer Physik [Sektion] C: Particles and Fields;* **38**: No. 1/2, 269-272(Apr 1988). (CONF-8708166—). Contract AC02-76CH00016.

From 6. international conference on ultra-relativistic nucleus-nucleus collisions; Nordkirchen, F.R. Germany (24 Aug 1987).

We discuss hadronic signals for quark gluon plasma formation in relativistic nuclear collisions utilizing a non-equilibrium model for hadronisation of the plasma state. In particular, we find that several (non-)strange antibaryon to baryon ratios may serve as a signal for a baryon-rich plasma state. The $K^+\pi^+$ ratio turns out to be not a direct signal for plasma formation due to its dependence on details of the collision dynamics and hadronisation mechanism. Finally we argue that the eta' to eta ratio might be useful as a 'gluonometer' in measuring the gluonic content of the matter formed in the initial stage of the collision process.

38624 Dirac-Brueckner-Hartree-Fock approach in finite nuclei. Muether, H.; Machleidt, R.; Brockmann, R. (State Univ. of New York, Stony Brook (USA). Dept. of Physics; California Univ., Los Angeles (USA). Dept. of Physics; Los Alamos National Lab., NM (USA); Mainz Univ. (Germany, F.R.). Inst. fuer Physik). *Physics Letters [Section] B;* **202**: No. 4, 483-488(17 Mar 1988). Contract AC02-76ER13001.

The Dirac-Brueckner-Hartree-Fock (DBHF) approximation, which has been successful in describing the saturation properties of infinite nuclear matter, is extended to the calculation of finite nuclei. As an example the ground-state properties of ^{16}O are discussed. Inclusion of the relativistic effects yields a considerable increase for the radius of the charge distribution with essentially no change of the calculated binding energy. This improves the agreement with the experimental data considerably.

38625 Binding energies of the s-shell hypernuclei and the Λ well depth. Bodmer, A.R.; Usmani, Q.N. (Illinois Univ., Chicago (USA). Dept. of Physics; Argonne National Lab., IL (USA). Physics Div.; Illinois Univ., Urbana (USA). Dept. of Physics; Jamia Milia Islamia, New Delhi (India). Dept. of Physics). *Nuclear Physics [Section] A;* **477**: No. 4, 621-651(22 Feb 1988). Contract W-31-109-ENG-38.

Variational Monte Carlo calculations have been made for the s-shell hypernuclei; the well depth has been calculated variationally with the Fermi hypernetted chain method. A satisfactory description of all the relevant experimental Λ separation energies and also of the Λp scattering is obtained with reasonable phenomenological central two-pion exchange ΛN and ΛNN forces and strongly repulsive dispersive ΛNN forces. For the latter both spin-independent and spin-dependent forms were considered with the spin-dependent form preferred. The latter implies a smaller spin dependence of the ΛN force and contributes ≃ 13 to the 0^+-1^+ spin-flip splitting of the A=4 hypernuclei. For the NN forces central Mafliet-Tjon potentials were mostly used.

38626 Statistical properties of many-particle spectra VI. Fluctuation bounds on N—N T-noninvariance. French, J.B.; Kota, V.K.B.; Pandey, A.; Tomsovic, S. (Department of Physics and Astronomy, University of Rochester, Rochester, New York 14627). *Annals of Physics (New York);* **181**: No. 2, 235-260(1 Feb 1988).

The preceding paper (V) shows that fluctuation analysis applied to experimental data in a chaotic region of the nuclear spectrum, determines values or bounds for a parameter Λ, proportional to the mean-squared near-diagonal matrix element of a symmetry-breaking interaction. The immediate interest is with time-reversal invariance (TRI) for which bounds, not values, are found. We show here how this information can be reduced to a bound on α, the relative magnitude of the time-reversal noninvariant (TRNI) part of the nucleon-nucleon interaction. This is done in terms of the level and transition-strength densities, both given as explicit functions of the Hamiltonian parameters. It is shown that, just as univariate Gaussian densities are essential ingredients of the state density, so also bivariate Gaussians enter naturally into a theory for the transition strengths. Calculations made for a subset, namely /sup 167,169/Er, ^{233}Th, and ^{235}U, of the nuclei considered in (V), give αapprox. $<2 \times 10^{-3}$, a value which by some arguments is at the boundary of fundamental interest. It is found that $\Lambda D\alpha^2$ is roughly constant over the periodic table and varies only slowly with energy. This implies that, for α-bounds better by perhaps a factor 4 (or α-values), we need more small strengths in nuclei with small spacings such as ^{238}U (which presently yields no Λ-bound). The methods introduced here, which admit a number of simplifying approximations, are applicable to TRI studies via detailed-balance experiments proceeding through a compound nucleus, to other symmetries, and to a wide class of other problems. copyright 1988 Academic Press, Inc.

38627 Algebraic approach to medium energy proton scattering. Wenes, G.; Ginocchio, J.N. (Los Alamos National Lab., NM (USA)). *Journal of Physics F (London). Metal Physics (London);* **14 Suppl.**: S65-S70(1988). (CONF-8708101—).

From 6. international symposium on capture gamma-ray spectroscopy; Leuven, Belgium (31 Aug 1987).

The Glauber approximation for medium energy scattering of hadronic projectiles from nuclei is combined with the Interacting Boson Model to produce a transition matrix for elastic and inelastic scattering states. Examples of application of this formalism to proton scattering from /sup 154/Gd are presented.

38628 Proton-neutron interaction and nuclear collectivity. Casten, R.F. (Brookhaven National Lab., Upton, NY (USA)). *Journal of Physics F (London). Metal Physics (London);* **14 Suppl.**: S71-S85(1988). (CONF-8708101—).

From 6. international symposium on capture gamma-ray spectroscopy; Leuven, Belgium (31 Aug 1987).

A review is given of several aspects, and empirical consequences, of the p-n interaction as it relates to the structure, phase transitions and collectivity of medium and heavy nuclei. The Nsub(p)Nsub(n) scheme is reviewed as background material while the emphasis centers on a discussion of a related quantity, the P factor, and on the relationship of the integrated strength of the p-n interaction to the empirically observed saturation of B(E2) values in the mid-shell regions of deformed nuclei.

38629 **Algebraic and supersymmetric treatment of odd-odd nuclei.** Paar, V.; Brant, S.; Vretenar, D.; Sunko, D.K.; Balantekin, A.B.; Huebsch, T. (Zagreb Univ. (Yugoslavia). Zavod za Theorijsku Fiziku; Oak Ridge National Lab., TN (USA); Maryland Univ., College Park (USA)). pp 179-188 of Symmetries and semiclassical features of nuclear dynamics. Invited lectures. Raduta, A.A. (Institutul Central de Fizica, Bucharest (Romania). Dept. of Theoretical Physics) (ed.). Berlin, Germany, F.R.; Springer (1987). (CONF-8609219—).

From Brasov international summer school: symmetrics and semiclassical features of nuclear dynamics; Poiana Brasov, Romania (1 Sep 1986).

Four related algebraic approaches to odd-odd nuclei are described. Results of recent calculations are given, and possible extensions and current problems are discussed.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

The present capability and future potential of accelerator-based monoenergetic and white neutron sources are outlined in the context of fundamental and applied neutron-nuclear research. The neutron energy range extends from thermal to 500+ MeV, and the time domain from steady-state to pico-second pulsed sources. Accelerator technology is summarized, including the production of intense light-ion, heavy-ion and electron beams. Target capabilities are discussed with attention to neutron-production efficiency and power-handling capabilities. The status of underlying neutron-producing reactions is summarized. The present and future use of neutron sources in: (i) fundamental neutron-nuclear research, (ii) nuclear-data acquisition, (iii) materials-damage studies, (iv) engineering test, and (v) biomedical applications are discussed. Emphasis is given to current status, near-term advances well within current technology, and to long-range projections.

Submitted to the International Conference on Neutron Physics (Kiev, 21-25 Sep 1987).

Theoretical consideration is given to the transmission of ultracold (UCN) neutrons through ferromagnetic films. A possibility is demonstrated to derive new information about spin dependence of the UCN-magnetic film interaction from experiments on UCN multitransmission. Two versions of the apparatus on the basis of UCN traps are proposed to measure transmissions thorugh one and the same film. the process of UCN flow from one trap into other through a mirror neutron guide is analysed. There is shown a possibility of storing a considerable part of the initial UCN flux. A combination of the UCN flow and storage modes in one setup is considered to show good prospects for the future study on thin magnetic films. 8 refs.; 4 figs.

From Accelerator design workshop; Los Alamos, NM, USA (22 Feb 1988).

The uses of neutron scattering as a probe for condensed matter phenomena are described briefly and some arguments are given to justify the community's desire for more powerful neutron sources. Appropriate design parameters for a neutron source at an Advanced Hadron Facility are presented, and such a source is compared with other existing and planned spallation neutron sources. 5 refs.

38642 (ORNL/RSIC—50) Discrete angle biasing in Monte Carlo radiation transport. Cramer, S.N. (Oak Ridge National Lab., TN (USA). Radiation Shielding Information Center). May 1988. Contract AC05-84OR21400. 91p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010736/JAW.

An angular biasing procedure is presented for use in Monte Carlo radiation transport with discretized scattering angle data. As in more general studies, the method is shown to reduce statistical weight fluctuations when it is combined with the exponential transformation. This discrete data application has a simple analytic form which is problem independent. The results from a sample problem illustrate the variance reduction and efficiency characteristics of the combined biasing procedures, and a large neutron and gamma ray integral experiment is also calculated. A proposal is given for the possible code generation of the biasing parameter p and the preferential direction {ovr{Omega}}$_0$ used in the combined biasing schemes.

From 8. international conference on plasma surface interactions in controlled fusion devices; Julich, F.R. Germany (2 May 1988).

We report the development of a hybrid analytic/Monte Carlo code for evaluating particle transport in solids. Atomic concentrations in the near surface implanted region of a target material {N{sub k}(x,t)}, are propagated by the code in time through the previously described method of equivalent atomic stopping (MEAS). Implantation source profiles {P{sub k}(x,t)} are obtained for the initial target composition with the TRIM code (TRI), and propagated in time along with the {N{sub K}(x,t)} by MEAS. TRIM is also invoked periodically to provide updated profiles {P{sub k}(x,t)}, since the MEAS procedure includes only first order corrections to the {P{sub k}} due to the evolution of the {N{sub k}}. The code provides for simultaneous implantation of several different atomic species and includes the local mixing model (LMM) for describing buildup to saturation and isotope exchange for implantation of hydrogen (and/or other species). 12 refs., 1 fig.

38644 (UCID—21276) Gamma ray emission from spheres pulsed with D-T neutrons: Results of May 1987 experiments at RTNS-1. Goldberg, E.; Hansen, L.F.; Howerton, R.J.; Komoto, T.T.; Pohl, B.A. (Lawrence Livermore National Lab., CA (USA)). Nov 1987. Contract W-7405-ENG-48. 44p. NTIS, PC A03;3. Order Number DE88011357/JAW.

Subsequent to the analysis of the June 1986 series of experiments at RTNS-1, we thought it sensible to repeat some of the experiments with greater care given to the high energy portions of the effluent gamma ray spectra. In addition, some new materials were recommended for study, such as silicon. And since among our earlier experiments we observed data which was not highly reproducible, repeated runs would provide a quantitative assessment of the precision of the experiments. Accordingly, we followed the procedure outlined in UCID-20884. First, we calibrated the NE-213 detector with standard gamma ray sources and checked for linearity of pulse height with energy deposited by electrons. We then conducted experiments at RTNS-1, using spherical configurations of C, Si, Al, H_2O, N_2,Ti, Fe, and C_2F_4. The H_2O was contained in a modified glass flask, while the liquid nitrogen was held in a double-walled steel dewar. 25 refs., 17 figs., 9 tabs.

38645 Propagation of a picosecond-duration, relativistic electron beam through hydrogen at atmospheric pressures. Fisher, A.S.; Pantell, R.H.; Feinstein, J.; Deloney, T.L.; Reid, M.B. (Department of Electrical Engineering, Stanford University, Stanford, California 94305). *Journal of Applied Physics;* **64**: No. 2, 575-580(15 Jul 1988).

An experiment demonstrating the propagation of a 42-MeV electron beam from an rf linear accelerator through 1 m of H_2 at pressures from 10^{-3} to 1.25 atm is reported. Measurements were made of the transmitted current and the beam's radius, transverse position, and angular divergence along the path. The beam current was fully transmitted at all pressures, without the often detrimental plasma interactions (space-charge neutralization, magnetic neutralization, and various plasma instabilities) seen in previous studies. The observed beam expansion was consistent with calculations of multiple scattering. The propagation can be attributed to the 4-ps duration of the accelerator's electron bunches. This time is three to four orders of magnitude shorter than that used in the earlier work and is shorter than the growth times for the beam-plasma interactions. Such a beam should prove suitable for a gas-loaded free-electron laser.

This paper gives the results of individual monitoring carried out on population after Chernobyl accident. After a brief description of measurement methods as well as instrumentation features, the results of I-131 contamination in thyroid and of beta-gamma emitters on people's skin and clothing are reported. From the information available it appears that people coming out from Kiev (U.S.S.R.) showed the higher contamination.

(Atomic Energy Control Board, Ottawa, Ontario (Canada)). Oct 1984. 19p. (CONF-841018—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88701918/JAW.

From International symposium on the implementation of the IAEA codes of practice and safety guides for nuclear power plants; Vienna, Austria (29 Oct 1984).

In 1983, the Atomic Energy Control Board and Atomic Energy of Canada Limited conducted a study of a possible joint program involving Canada, a nuclear power plant importing Member State and the IAEA for the development of the national nuclear safety regulations and guides based on NUSS documents. During the study, a work plan with manpower estimates for the development of design was prepared as an investigatory exercise. The work plan suggests that a successful NUSS implementation in developing Member States will require availability of significant resources at the start of the program. The study showed that such a joint program could provide an effective mechanism for transfer of nuclear safety know-how to the developing Member States through NUSS implementation.

38653 (INIS-mf—11153, pp 43-50) **5. Radiation protection.** Konecny, J. 1987. (In Czech). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88780081/JAW.

In Nuclear power. CAEC lecturers' manual.

The problems, targets and principles of radiation protection are surveyed. The most important concepts, quantities and units used in radiation protection are listed. Attention is paid to biological radiation effects, external and internal irradiation, radiaton sources and dosimetric systems at nuclear power plants. Discussed are the basic methods of radiation protection based on the factor of time, distance from the radiation source and shielding, and the questions of the limit dose system which should comprise the justification of the respective human activity, optimization of radiation protection and annual dose equivalent limits. The limits are outlined of reducing exposure with respect to costs which society is willing to expend for the given purpose. (Z.M.).

38654 **(PNL—6500-Pt.5) Pacific Northwest Laboratory annual report for 1987 to the Assistant Secretary for Environment, Safety, and Health: Part 5: Environment, safety, health, and quality assurance.** Faust, L.G.; Steelman, B.L.; Selby, J.M. (Pacific Northwest Lab., Richland, WA (USA)). Feb 1988. Contract AC06-76RL01830. 63p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011704/JAW.

Part 5 of the 1987 Annual Report to the US Department of Energy's Assistant Secretary for Environment, Safety, and Health presents Pacific Northwest Laboratory's progress on work performed for the Office of Nuclear Safety, the Office of Environmental Guidance and Compliance, the Office of Environmental Audit, and the Office of National Environmental Policy Act Project Assistance. For each project, as identified by the Field Work Proposal, articles describe progress made during fiscal year 1987. Authors of these articles represent a broad spectrum of capabilities derived from five of the seven technical centers of the Laboratory, reflecting the interdisciplinary nature of the work.

38655 **Fast MLE for SPECT using an intermediate polar representation and a stopping criterion.** Herbert, T.; Leahy, R.; Singh, M. (Signal and Image Processing Institute, Dept. of Electrical Engineering-Systems, Univ. of Southern California, Los Angeles, CA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 615-619(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

The maximum likelihood (ML) approach to SPECT has received considerable interest since the application of the EM algorithm to emission tomography. In addition to the appealing asymptotic properties of ML solutions, the EM algorithm has guaranteed convergence to a positive solution. In practice, several drawbacks to a ML approach are encountered: 1) the computational demands are quite large, especially in comparison to non-iterative techniques; 2) reconstructions tend to take on an increasingly, non-smooth quality as the ML solution is approached, so the algorithm is usually terminated long before convergence. The authors address these problems on two levels. First, the authors perform the actual source estimation on a rectangular grid, but the authors use a polar pixel representation of the source during forward/back projection operations to reduce the computational requirements. Secondly, they use a chi-squared test to statistically determine a suitable cut-off point for the iterative process.

38658 (CONF-880614—3) Temperature dependence and the moving species during ion mixing. Xia, W.; Fernandes, M.; Hewett, C.A.; Lau, S.S.; Poker, D.B.; Biersack,J.P. (California Univ., San Diego, La Jolla (USA). Dept. of Electrical and Computer Engineering; Oak Ridge National Lab., TN (USA); Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)). 1988. Contract AC05-84OR21400. 18p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88010459/JAW.

From 7. international conference on ion implantation technology; Kyoto, Japan (7 Jun 1988).

In this paper, the authors review the experimental observations of the temperature dependence and the moving species in ion mixing, emphasizing the metal-semiconductor systems. Ion mixing is the combined effect of two components. One component is temperature independent and is primarily due to events in the prompt regime, the other component is temperature dependent and has the characteristics of the associated thermal reactions. The moving species during ion mixing are influenced by collisional effects, either due to secondary recoils, or due to local hot spots, or both. The secondary recoil concept is consistent with experimental observations that the motion of the lighter element in a bilayer sample is enhanced. There is ample evidence that while the a thermal regime is caused by particle-solid interactions, thermodynamical forces are important in deciding the magnitude of mixing. In the thermally activated regime, the ion induced reaction product should be influenced by the heats of formation of various compounds. We also indicate areas where satisfactory explanations are not available at present.

38659 (CONF-8804117—3) Computer simulation of elastic properties of grain boundary materials. Wolf, D.; Lutsko, J.F. (Argonne National Lab., IL (USA)). Apr 1988. Contract W-31-109-ENG-38. 7p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011965/JAW.

From Adhesion in solids; Reno, NV, USA (5 Apr 1988).

Lattice statics and lattice dynamics computer simulation methods are applied to investigate the elastic properties of grain boundaries in fcc metals. The elastic constants in the GB region are found to differ significantly from their bulk ideal-crystal values. Due to the broken symmetry in the GB region a pronounced anisotropy of the elastic properties is observed. Whereas Young's moduli are found to increase in the GB region, the shear modulus and Poisson's ratios generally decrease. The magnitude of these effects is shown to depend sensitively on the GB structure.

38660 (CONF-8804141—2) Energy deposition by partially stripped ions. Crawford, O.H. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 10p. (CONF-8804141—2; CONF-8804141—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011409/JAW.

From 11. Werner Brandt workshop on penetration phenomena of charged particles in water; Oak Ridge, TN, USA (14 Apr 1988).

The report discusses both the collisional and the restricted collisional energy deposition rates of partially stripped ions. The results may be useful in connection with radiation effects that depend on the amount of energy deposited close to the surface of a target. 6 refs., 4 figs.

38661 (CONF-8805110—1) Challenge equality problems in lattice theory. McCune, W. (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010094/JAW.

From 9. international conference on automated deduction (CAD-9); Argonne, IL, USA (23 May 1988).

This note contains five problems which should be useful for experimentation with equality-oriented automated theorem-proving programs. The problems are formally stated and proved in first-order predicate calculus with equality. The problems are taken from the often-overlooked paper "Semi-automated mathematics" by Guard et al. All of the theorems concern the existence and uniqueness of complements in modular lattices with 0 and 1.

38662 (CONF-8805140—2) Dynamics of high-energy nucleus-nucleus collisions. Wong, C.Y.; Lu, Z.D. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 13p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011387/JAW.

From International conference on medium- and high-energy nuclear physics; Taipei, Taiwan (23 May 1988).

The authors use a Glauber multiple-collision model to examine the dynamics of nucleus-nucleus collisions. The model introduces a stopping law, which describes how a baryon loses energy in a baryon-baryon collision, and a particle production law, which is based on the baryon energy loss. The model gives results on the longitudinal energy loss which compare well with the recent WA80 experimental data for ^{16}O on various targets at 60 and 200 GeV per nucleon. The stopping law that is needed to fit the experimental zero-degree spectra reveals that the degree of stopping in these high-energy nuclear collisions is high.

38663 (DOE/ER/13429—3) Supersonic bare metal cluster beams: Technical progress report, April 15, 1987-April 15, 1988. Smalley, R.E. (Rice Univ., Houston, TX (USA). Dept. of Chemistry). 1988. Contract FG05-85ER13429. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88010244/JAW.

The emphasis in our bare metal cluster research over the past year has continued to focus on development and applications of the two key new techniques: FT-ICR and UPS. FT-ICR is a technique for the study of chemisorption phenomena on bare metal cluster ions. UPS (ultraviolet photoelectron spectroscopy) is used to study size-selected negative cluster ions. Both are described in this paper. (LSP)

38664 (DOE/ER/45144—2) Research in the theory of condensed matter and elementary particles: Final report, September 1, 1984-November 30, 1987. Friedan, D.; Kadanoff, L.; Nambu, Y.; Shenker, S. (Chicago Univ., IL (USA)). Apr 1988. Contract FG02-84ER45144. 53p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010180/JAW.

Progress is reported in the field of condensed matter physics in the area of two-dimensional critical phenomena, specifically results allowing complete classification of all possible two-dimensional critical phenomena in a certain domain. In the field of high energy physics, progress is reported in string and conformal field theory, and supersymmetry.

38665 (DOE/ER/45211—2) Non-transferable van der Waals potentials: Insulators at high pressure. Maggs, A.C.; Ashcroft, N.W. (Cornell Univ., Ithaca, NY (USA). Lab. of Atomic and Solid State Physics). Jan 1987. Contract FG02-85ER45211. 13p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009162/JAW.

For a simple model whose cohesion is dominated by dispersion forces we show that the expansion of the energy in terms of multi-center interactions is ill conditioned at a low density. This density is physically realizable for systems with highly polarizable atoms, and in these circumstances an alternative expression for the internal energy is required. For polarizable systems the requisite

densities are readily achievable with the use of modern high pressure capabilities, and have consequences for the interpretation of equation of state data in terms of potential energy functions. 13 refs., 3 figs.

38666 **(DOE/ER/45334—1) Electronic states in tunneling semiconductor superlattices: Technical progress report for the period September 15, 1987-September 14, 1988.** Ulloa, S.E. (Ohio Univ., Athens (USA). Dept. of Physics and Astronomy). 15 May 1988. Contract FG02-87ER45334. 14p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011571/JAW.

This research project funded by DOE has concentrated in the systematic study of the effects of a gate voltage on the electronic structure of a tunneling superlattice system. The effects of strong magnetic fields and other various parameters on energy levels of tunneling superlattices have been investigated.(LSP)

38667 **(INFN/TC—88-3) Thin films preparation by the electrospray method in heavy ion induced desorption experiments.** Riggi, F.; Spina, R. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1988. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702279/JAW.

Some details of the experimental procedure used to prepare thin films of organic compounds by the electrospray method are reported.

38668 **(INFN/TC—88-5) Angular dependence on the sputtering yield measured by low energy pixe analysis.** Torrisi, L. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1988. 12p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702280/JAW.

Sputtering yield of Au thin films by 80 KeV argon ions bombardament has been measured "in situ" using the PIXE analysis with low energy proton beams (100 KeV). Typically a rising yield is seen, as the angle between surface normal and incoming beam, θ, increases from zero, according the sec θ law. The measured angular dependence on the sputtering yield and the used analysis method have been discussed in detail.

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

A variational method is used to find approximative solutions of the Hubbard model for the ground state of the bcc lattice in the weak and strong coupling limits. The neutral case (a half-filled band) is found to be antiferromagnetic for all values of the coupling constant. However, for other choices of the band-filling second order phase transitions between different magnetic structures are found if the coupling constant is varied.

38697 (INIS-mf—11700) **Localization and diffusion of positive muons in electron irradiated niobium and tantalum.** Doering, K.P. (Stuttgart Univ. (Germany, F.R.). Fakultaet 12 - Physik). 22 Jun 1987. 241p. (In German). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88753551/JAW.

For monocrystals of Ta and very pure Nb the transversal spin-depolarization (or relaxation) of positive muons is measured. It is found that for both metals by irradiation with 3 MeV electrons two further sorts of defects are created which capture the muons. For the quantitative analysis a model is developed. (orig./BHO).

Submitted to the journal Phys. Status Solidi.

Using traditional approximations, the correction for thermal diffuse scattering in the neutron time-of-flight diffraction on monocrystals is calculated. This scattering measured by the time-of-flight

method from that measured by the angular dispersive diffraction method and this can be explained with the aid of the scattering surface. In time-of-flight the scattering surface has different geometries in three regions of the ratio between the sound velocity in crystal and the neutron velocity; in the angular dispersive method are only two such regions. The difference between the two methods disappears if the flight path after sample is very small comparatively with the total flight path. 13 refs.; 6 figs.

38699 **(JINR-E—14-87-662) Texture investigation by neutron diffraction.** Feldmann, K. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1987. 10p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702917/JAW.

Submitted to the 8. Intern. Conf. on Textures of Materials ICOTOM 8, Santa Fe, USA, 20 - 25 Sep, 1987.

In the conventional angle dispersive neutron diffraction a monochromatic neutron beam is used. The pole figures under investigation have to be scanned one after another. The commonly applied angle dispersive method is limited to the consideration of Bragg reflection being isolated in the diffraction pattern. The application of multidetectors or position sensitive detectors is discussed. In the neutron time-of-flight (TOF) diffraction a white pulsed neutron beam allows one to satisfy the Bragg law for all lattice spacing at a fixed scattering angle. The main charateristics of the TOF diffraction experiment are shortly outlined. In this method all non-forbidden Bragg reflections are recorded in one pattern simultaneously. The TOF technique is well-suited to study low symmetric or multiphased specimens, especially geological materials, requiring a large number of pole figures for mathematical texture analysis. Multidetector systems can be used to shorten the necessary time for experiments. The registration of all Bragg reflections of fixed scattering geometry is equivalent to the information of the inverse pole figure for the corresponding sample position. Having short exposition times this approach can be applied for in-situ investigations. The magnetic moments of neutrons can be used to study magnetic anisotropies in materials. Two different techniques are discussed. 20 refs.; 7 figs.

38700 **(JINR-R—14-86-857) Study of the localized vibrations of the hydrogen in solid solution Zr-O by inelastic neutron scattering.** Kraciun, K.N.; Morozov, S.I.; Natkanets, I.; Sumin, V.V. (Institutul de Reactori Nucleari Energetici, Pitesti (Romania); Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Submitted to the journal Sov. Phys. - Solid State.

Dynamics of implanted hydrogen and oxygen atoms in zirconium was investigated at 293 and 80 K and at different concentrations of impurity atoms. Hydrogen vibration energy in solid solution ZrO/sub 0.25/H/sub 0.09/ Planck constantω ≃ 141 MeV is close to hydrogen vibration energy in σ phase of zirconium hydride (Planck constantω ≃ 138 MeV) changing under adequate conditions. In a specimen with law oxygen content ZrO/sub 0.03/H/sub 0.01/ hydrogen vibration energy coincides with maximum position of zirconium hydride optical band. It is suggested that, as in Ti-O-H system, at low oxygen content in Zr-O-H no complete suppression of hydride precipitation occurs. Data on structural analysis of ZrO/sub 0.37/ and ZrO/sub 0.37/D/sub 0.1/ alloys are given. The JINR Laboratory of Neutron Physics has been performed the investigation. 25 refs.; 5 figs.; 1 tab.

38701 **(JINR-R—14-87-629) Study of nonhomogeneous magnetized magnetic films with polarized neutrons.** Korneev, D.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics). 1987. 11p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702946/JAW.

Submitted to the journal Poverkhn.: Fiz., Khim., Mekh. and to the Conference on physics of condensed media on the IBR-2 reactor JINR, Sept., 1987, Dubna.

It is shown that with reflection of polarized neutrons from the surface of nonhomogeneous magnetic films one can judge about the spatial behaviour local magnetization vector M-vector(z). A theoretical method for interpretation of experimental results in order to determine the function M-vector(z) is proposed. 9 refs.

38702 **(JINR-R—17-87-553) Phase transition in the model of proton superionic crystal.** Dzhavadov, N.A.; Plakida, N.M. (AN Armyanskoj SSR, Erevan). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702948/JAW.

Submitted to the journal Sov. Phys. - Crystallogr. .

A model for order-disorder phase transition for protons on hydrogen bonds in superionic conductor like cesium hydrogen sulphates is proposed. Possible types of proton ordering in the structural transition D/sub 4h/^{19} -> C/sub 2h/^{5}, with doubling of the primitive cell volume are investigated by the concentration wave method. 16 refs.

38703 **(LA—11192-MS) A numerical study of Rayleigh-Taylor instability in aluminum and steel plates.** Daly, B.J. (Los Alamos National Lab., NM (USA)). Mar 1988. Contract W-7405-ENG-36. 31p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010475/JAW.

The SCRAM code is applied to the study of Rayleigh-Taylor instability in metal plates, and comparisons of these computer results are made with experimental data for 1100-O aluminum, 6061-T6 aluminum and 304 stainless steel. Various models for the pressure, temperature, and strain-rate dependencies of the flow stress are compared in the computer calculations. The coefficients that are required in these models to give good agreement with the experimental results are generally close to values that were determined from previous experimental comparisons. The sensitivity of the computed results to modeling parameters, to variations in the hardening modulus, and to the amplitude and wavelength of the perturbations in the plate surface is examined. Very little growth in amplitude occurs if either the initial amplitude or the wavelength is sufficiently small. The growth rate increases monotonically with increasing initial amplitude. There appears to exist a wavelength of maximum growth, such that the growth rate increases rapidly with wavelength up to this wavelength, but then decreases slowly as the wavelength is further increased.

38704 **(LA-UR—88-1519) Muon spin depolarization in Gd- and EuBa$_2$Cu$_3$O/sub x/.** Cooke, D.W.; Hutson, R.L.; Kwok, R.S.; Maez, M.; Rempp, H.; Schillaci, M.E.; Smith, J.L.; Willis, J.O.; Lichti, R.L.; Chan, K.C.; Boekema, C.; Weathersby, S.; Oostens, J. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 7p. (CONF-880431—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010954/JAW.

From International conference on the first two years of high-{Tc} superconductivity; Tuscaloosa, AL, USA (11 Apr 1988).

Postive muon spin rotation (μSR) measurements on Gd- and EuBa$_2$Cu$_3$O/sub x/ (x ~ 7) have been conducted in the temperature interval 4-300K. For each sample, muons stop both at grain boundaries and within the superconducting grains. Measured magnetic field penetration depths are 1550 and 1900{angstrom} for two specimens of GdBa$_2$Cu$_3$O/sub x/, and 1350{angstrom} for EuBa$_2$Cu$_3$O/sub x/. 2 refs., 5 figs.

38705 **(LA-UR—88-1738) The Fog-oil anomaly confirmed in HELSMK-I tests.** Gerstl, S.; Chitanvis, S.; Zardecki, A.; Wallace, J.; Gebhardt, F.; Dekinder, B. (Los Alamos National Lab., NM (USA)). May 1988. Contract W-7405-ENG-36. 7p. (CONF-8804108—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010927/JAW.

From 12. symposium on smoke/obscurants; Laurel, MD, USA (19 Apr 1988).

Modeling analyses of preliminary experimental data obtained from the High Energy Laser (HEL) beam propagation tests (HELSMK-I) through tactically significant smokes are presented for the case of Fog-oil (FO). Thermal imager data together with transmission measurements and other experimental evidence are used to reconstruct and model the interaction physics of the HEL

beam with FO. An earlier theoretical model by Wallace (1983) predicted that the high energy beam would vaporize large (>10μm) FO droplets, while the smaller droplets primarily conduct their energy to the ambient air, thereby enhancing thermal blooming in air. This behavior is categorized as an anomaly for the interaction of a HEL beam with aerosols because complete vaporization would normally have been expected. The HELSMK-I test together with computational results from our nonlinear beam propagation codes confirmed this prediction. Fog-oil can thus be classified as an effective smoke shield against a HEL threat in open air at infra-red wavelengths, at flux levels of a few tens of Kilowattscm^2. These results also validated our computer models which show that a punch-through effect is prevented in FO due to its enhanced blooming characteristics. 5 refs., 7 figs.

38706 **(SAND—88-0108) A comparison of analytical techniques for modeling the Rayleigh-Taylor response of elastic-plastic solids.** Robinson, A.C. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 34p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010372/JAW.

The Rayleigh-Taylor instability response of elastic-plastic solids can be modeled by approximate means. However, neither the linear elastic response equation nor the so-called {open←quotes}minimum amplitude{close←quotes} instability criterion derived from rigid plastic analyses is sufficient to describe overall stability characteristics at very large driving pressures. We compare several versions of the modal or one-degree-of-freedom approximation technique and indicate the common features which must be included to obtain the qualitative response seen in numerical experiments.

38707 **(UCID—21407) Results of initial phase conjugation experiments in CS_2 and CCl_4.** Milam, D.; Marshall, C.; Vercimak, C.; Moore, T. (Lawrence Livermore National Lab., CA (USA)). 17 May 1988. Contract W-7405-ENG-48. 32p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number TI88010730/JAW.

A liquid with lower nonlinear refractive index, CCl_4, provided conjugated beams with clean near field distribution, unless astigmatism was added to the input beam. Astigmatism caused fringing on the conjugated beam. The tendency toward fringing was diminished in our more recent experiments in glass and methane. Measured thresholds and reflectances for both CS_2 and CCl_4 agreed with published results. Waveforms of pulses produced by SBS are different from those of the input pulse. Except for tansients observed on the leading edge, all aspects of the SBS wave form can be explained. Correction by conjugation in $CCl_4$for up to 4.5 waves of astigmatism provided beams with divergence not greater than twice the diffraction limit. Experimental error may account for some of the apparent divergence. 12 refs., 12 figs.

38708 **(UCRL—97218) Short pulse x-ray diffraction studies of shocked and annealed crystals using the JANUS research laser.** Lee, R.W.; Eckart, M.J.; Kilkenny, J.D.; Whitlock, R.R.; Hauer, A.; Wark, J.S. (Lawrence Livermore National Lab., CA (USA); Naval Research Lab., Washington, DC (USA); Los Alamos National Lab., NM (USA); Rochester Univ., NY (USA). Lab. for Laser Energetics). 1987. Contract W-7405-ENG-48. 15p. (CONF-8708110—38). NTIS, PC A03;3. Order Number DE88011329/JAW.

From 31. SPIE annual international technical symposium on optical and optoelectronic applied science and engineering; San Diego, CA, USA (16 Aug 1987).

When a crystal is annealed or shocked the spacing of the interatomic planes is altered, and a measurement of the lattice spacing can yield information on the temperature or compression respectively. We have used the JANUS research laser at LLNL to perform such measurements of transiently strained crystals. JANUS is a two-beam laser system, with separate synchronized oscillators for each beam. One beam of the laser, containing 10 - 100 J of 1.06μm light in a pulse of 1 ns FWHM, was found to a 3.9 cm diameter spot on the surface of silicon crystal; the crystal was either annealed or shock-compressed, depending on the absence or presence of a variety of thin coatings applied to the crystal surface. At some time during or after the perturbing pulse, the second synchronous but delayed laser beam, containing {approximately}10 J of 0.53μm light in a pulse of 100 ps (FWHM), was focused to a 40μm diameter spot onto a separate target containing calcium, potassium, and chlorine. Thus, a short pulse of the helium-like line radiation of these atoms was produced, and this radiation was Bragg diffracted from the surface of the strained crystal. Measurements of the change in Bragg angle, caused by thermal expansion or shock compression, gives a direct measurement of one component of the strain within the crystal. A single laser shot gives recordable x-ray levels. A number of shots at different irradiances and delay times gave information about the lattice spacing as a function of time. The potential applications of such results is discussed. 10 refs., 6 figs.

38709 **(UCRL—98862) Recent applications of the Boltzmann master equation to heavy ion precompound decay phenomena.** Blann, M.; Remington, B.A. (Lawrence Livermore National Lab., CA (USA)). Jun 1988. Contract W-7405-ENG-48. 11p. (CONF-8806144—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011721/JAW.

From 5. international conference on nuclear reaction mechanisms; Villa Monastero, Italy (13 Jun 1988).

The Boltzmann master equation (BME) is described and used as a tool to interpret preequilibrium neutron emission from heavy ion collisions gated on evaporation residue or fission fragments. The same approach is used to interpret neutron spectra gated on deep inelastic and quasi-elastic heavy ion collisions. Less successful applications of BME to proton inclusive data with 40 MeV/u incident ^{12}C ions are presented, and improvements required in the exciton injection term are discussed.

38710 **Crystallization of fcc (111) and (100) crystal-melt interfaces: A comparison by molecular dynamics for the Lennard-Jones system.** Burke, E.; Broughton, J.Q.; Gilmer, G.H. (Department of Materials Science, S.U.N.Y. Stony Brook, Stony Brook, New York 11794). *Journal of Chemical Physics;* **89**: No. 2, 1030-1041(15 Jul 1988).

The crystal growth rates of Lennard-Jones fcc (face-centered cubic) (111) and (100) faces into the melt have been studied as a function of undercooling by molecular dynamics. The (100) grows without activation energy barrier at rates determined by the difference in the free energies of the crystal and melt phases, and the arrival rate of atoms across a plane determined from the kinetic theory of gases. The maximum velocity occurs at approximately half the melting point and represents 80 m/s for argon. The (111), on the other hand, grows at rates two to three times lower than this; the exact rate being size dependent. The growth kinetics are now activated and resemble Wilson—Frenkel behavior. However, the step responsible for such activation is not the simple liquid diffusion of Wilson—Frenkel theory, but rather the concerted motion of atoms at the interface selecting either all fcc or all hcp (hexagonal close packed) triangular lattice sites before a layer can grow.

38711 **Collective effects in electronic sputtering of organic molecular ions by fast incident cluster ions.** Salehpour, M.; Fishel, D.L.; Hunt, J.E. (Chemistry Division, Argonne National Laboratory, Argonne, Illinois 60439). *Journal of Applied Physics;* **64**: No. 2, 831-834(15 Jul 1988).

The collective sputtering effect of fast primary cluster ions on the yield of secondary molecular ions has been demonstrated for the first time. Results show that the sputtering yield of valine negative molecular ions per incident carbon atom, in a C+/sub n/ incident cluster ion, increases with increasing n. The yield results are interpreted as a direct effect of the enhancement in the electronic stopping power per atom in cluster ions compared to atomic ions.

38712 **Quantum-mechanical cluster-lattice interaction in crystal simulation: Hartree-Fock method.** Kunz, A.B.; Vail, J.M. (Department of Physics, Michigan Technological University, Houghton, Michigan 49931). *Physical Review [Section] B: Condensed Matter;* **38**: No. 2, 1058-1063(15 Jul 1988).

The problem of describing quantum mechanically a region of interest in an otherwise extended lattice is discussed for nonmetallic solids. A localizing potential to accomplish this is described, and its implications for the total-energy algorithm are analyzed. A spurious

tunneling effect that may arise with a finite embedding lattice is also discussed.

38713 **Quantum-mechanical cluster-lattice interaction in crystal simulation: Many-body effects.** Kunz, A.B.; Meng, J.; Vail, J.M. (Department of Physics, Michigan Technological University, Houghton, Michigan 49931). *Physical Review [Section] B: Condensed Matter;* **38**: No. 2, 1064-1066(15 Jul 1988).

The problem of describing quantum mechanically a region of interest in an otherwise extended lattice is discussed for nonmetallic solids. Hartree-Fock effects were considered in the preceding work, and in the present paper we consider the application of a many-body perturbation-theory correlation correction. The application of this formalism to NaF crystals containing Cu is considered as an illustration of the method. These results tend to validate the total procedure including the utility of correlation corrections for such problems.

38714 **Nonequilibrium transport of an electron-phonon-hole system in a semiconductor quantum well.** Zheng, T.F.; Cai, W.; Lax, M. (Department of Physics, City College of the City University of New York, New York New York 10031). *Physical Review [Section] B: Condensed Matter;* **38**: No. 2, 1406-1416(15 Jul 1988).

The recently developed transport theory of two-dimensional carriers has been applied to an electron-lattice-hole system with an applied electric field in GaAs-Ga/sub 1-//sub x/Al/sub x/As heterojunction. The renormalized carrier-carrier coupled potentials and the renormalized carrier-phonon coupled potentials (including hole-lattice deformation potential) are derived in the ring diagram approximation. Force and energy balance equations of electrons and holes are obtained by a nonequilibrium density operator technique. These four balance equations are solved numerically in the steady state. The result shows that the electrons are heated in the applied electric field much more than the holes and the electron-hole interaction enhances the energy and momentum loss rate of electrons. These results are in agreement with recently experimental data.

38715 **Low-temperature properties of the two-impurity Kondo Hamiltonian.** Jones, B.A.; Varma, C.M.; Wilkins, J.W. (Laboratory of Atomic and Solid State Physics, Clark Hall, Cornell University, Ithaca, New York 14853 and AT&T Bell Laboratories, 600 Mountain Avenue, Murray Hill, New Jersey 07974). *Physical Review Letters;* **61**: No. 1, 125-128(4 Jul 1988).

For the two-impurity Kondo system, the low-temperature properties: impurity spin-spin correlation function, susceptibilities, specific heat, and Wilson ratio: are strongly nonuniversal functions of the ratio (I_0/T/sub K/) of the Ruderman-Kittel-Kasuya-Yosida coupling to the single-impurity Kondo temperature. In particular, there is a new unstable fixed point for an antiferromagnetic coupling with I_0/T/sub K/$\approx$2.2. The calculations utilize a newly found symmetry of Kondo Hamiltonians, axial charge.

38716 **Stimulated two-photon annihilation of positrons channeled in crystals.** Kurizki, G.; Friedman, A. (Chemical Physics Department, Weizmann Institute of Science, Rehovot, Israel 76100). *Physical Review [Section] A: General Physics;* **38**: No. 1, 512-514(1 Jul 1988).

It is pointed out that the emission of photons in the GeV range produced by the annihilation of channeled positrons can be stimulated by superfluorescent emission of characteristic radiation in the MeV range from a beam of channeled electrons or positrons. The threshold current for the entire process is $\sim$10/sup 10/ times lower than that of stimulated Compton scattering of visible light into the MeV range of frequencies.

38717 **Bulk elastic wave propagation in partially saturated porous solids.** Berryman, J.G.; Thigpen, L.; Chin, R.C.Y. (Lawrence Livermore National Laboratory, P.O. Box 808, L-156, Livermore, California 94550). *Journal of the Acoustical Society of America;* **84**: No. 1, 360-373(Jul 1988).

The linear equations of motion that describe the behavior of small disturbances in a porous solid containing both liquid and gas are solved for bulk wave propagation. The equations have been simplified by neglecting effects due to changes in capillary pressure. With this simplifying assumption, the equations reduce to two coupled (vector) equations of the form found in Biot's equations (for full saturation) but with more complicated coefficients. As in fully saturated solids, two shear waves with the same speed but different polarizations exist as do two compressional waves with distinct speeds. Attenuation effects can be enhanced in the partially saturated solid, depending on the distribution of gas in the pore space. Two models of the liquid/gas spatial distribution are considered: a segregated-fluids model and a mixed-fluids model. The two models predict comparable attentuation when the gas saturation is low, but the segregated-fluids model predicts a more rapid roll-off of attenuation as the gas saturation increases.

38718 **Chemical and elastic effects on isostructural phase diagrams: The epsilon-c-G approach.** Ferreira, L.G.; Mbaye, A.A.; Zunger, A. (Solar Energy Research Institute, Golden, Colorado 80401). *Physical Review [Section] B: Condensed Matter;* **37**: No. 18, 10547-10570(15 Jun 1988).

Numerous theoretical models of temperature-composition phase diagrams of isostructural binary alloys are based on the configurational Ising Hamiltonian in which the many-body configurational interaction energies epsilon-c/sup (//sup n//sup)/ are taken as (volume-independent) constants (the "epsilon-c-only" approach). Other approaches postulate phenomenologically composition-dependent but configuration- (σ-) independent elastic energies. We show that under the commonly encountered situation where molar volumes at fixed composition (x) do not depend on the state of order, a new approach is pertinent: We prove that the physically relevant Hamiltonian (the "epsilon-c-G approach") includes the configuration-dependent (but concentration-independent) "chemical" interaction energies epsilon-c/sup (//sup n//sup)/, plus a composition-dependent (but configuration-independent) elastic energy G(x). We compute the elastic term G(x) from the structural and elastic properties of ordered intermetallic systems. We show that inclusion of G(x) into the conventional configurational (epsilon-c-only) Hamiltonian cures many of the shortcomings of such Ising models in describing actual alloy phase diagrams.

38719 **Polytope models for local icosahedral packing: An electronic structure analysis.** Phillips, R.B.; Carlsson, A.E. (Department of Physics, Washington University, St. Louis, Missouri 63130). *Physical Review [Section] B: Condensed Matter;* **37**: No. 18, 10880-10883(15 Jun 1988).

The electronic properties of recently developed icosahedral packing schemes using polytope {3,3,5} (a packing of atoms on S_3, the surface of the unit sphere in four dimensions, with perfect icosahedral symmetry) are analyzed within the framework of a d-band, tight-binding model. It is shown that there is a one-parameter family of prescriptions for defining the interatomic couplings, which preserves the icosahedral symmetry and generalizes earlier schemes. The bonding energies for several representative cases are calculated and compared to those in the fcc structure. The results are extremely sensitive to the prescription used to define the couplings.

38720 **Frenkel-Kontorova model with nonconvex-interparticle interactions and strain gradients.** Marianer, S.; Bishop, A.R. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9893-9896(1 Jun 1988).

We study the statics and dynamics of a chain of atoms moving in a periodic potential with nonlinear, nonconvex interparticle interactions, and with strain gradients which we model by including next-nearest-neighbor interactions through the discrete Hamiltonian H = +u/sub n/-1)^2-cos u/sub n/. We obtain the phase diagram within an ansatz of periodically modulated configurations. These generalize the homogeneous (for β<(18) and dimerized (for β>(18) configurations reported previously for γ = 0, and are given by u/sub n/ = na_1+b_1 for n = 1,...,N and u/sub n/ = na_2+b_2 for n = N+1,...,M. The dynamics of transitions between different configurations when the parameters are varied is also investigated and we show that these are dominated by nucleation processes, which occur on short time scales compared with the subsequent slow growth. The possible relevance of the model to the

dynamics of twin boundaries recently observed in the copper-oxide high-temperature superconductors is discussed.

38721 **Theoretical calculations of phase transitions in the megabar regime.** Cohen, M.L. (Dept. of Physics, Univ. of California, and Materials and Chemical Sciences Div., Lawrence Berkeley Lab., Berkeley, CA (US)). *Scripta Metallurgica;* 22: No. 2, 127-132(Feb 1988). Contract AC03-76SF00098.

There is a delicate balance between the various components of the Coulomb energy which hold crystalline solids together. These components depend sensitively on the structural arrangements of the atoms and their separations. High pressure experiments provide a useful probe of the interactions since volumes and, in turn, lattice constants are varied in a manner which can be simulated theoretically. Hence, various properties and phase transitions can be examined as a function of pressure. Some of the most dramatic of these include structural, insulator-metal, and superconducting transitions. Theoretical approaches such as the pseudopotential method are capable of explaining and predicting pressure-dependent properties using only information about the constituent atoms composing the solid. In particular, for the calculations described here, only the atomic numbers and masses are used to test the energies and properties of candidate crystal structures.

38722 **Phase-matched harmonic generation in single microcrystals.** Velsko, S.P. (Lawrence Livermore National Lab., Nonlinear Optical Materials Group, P.O. Box 5508, Livermore, CA 94550 (US)). pp 78 of XV international conference on quantum electronics (Digest of technical papers). Washington, DC; Optical Society of America (1987). (CONF-870488—).

From 15. international conference on quantum electronics; Baltimore, MD, USA (27 Apr 1987).

Technical Paper TUHH 4.

The phase-matched harmonic generation parameters determining the conversion efficiency of a nonlinear material are the effective nonlinear coupling, angular sensitivity, and temperature bandwidth. In practice, it is very difficult to extract an accurate estimate of these parameters from the traditional powder measurements because of systematic bias in the orientational distributions of the particles and because several distinct phase-matching conditions may contribute to the powder signal. Until now, rapid unambiguous characterization of new nonlinear materials has been hampered by the perceived necessity of growing large (cm^3) sized single crystals for linear and nonlinear optical measurements. The authors developed a method for directly measuring second harmonic generating efficiencies in single crystals as small as 300 μm.

Submitted to the journal Sov. Phys. - Usp. .

The paper gives a brief critical analysis of General Relativity Theory (GRT). It is shown that the theory, if accepted, leads to repudiation of a number of fundamental principles underlying physics. It expounds Relativistic Theory of Gravitation (RTG) in which the gravitational field possesses all the attributes of physical fields and which is consistent completely with the fundamental physical principles as well as with the experimental and observational facts available. It also considers the consequences of RTG dealing, in particular, with the development of collapse and Universe evolution. 47 refs.

Lab. of Theoretical Physics; Akademie der Wissenschaften der DDR, Dresden. Zentralinstitut fuer Festkoerperphysik und Werkstofforschung). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics). 1987. 5p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702919/JAW.

Submitted to the journal Europhys. Lett. .

A considerable enhancement of the superconducting transition temperature T/sub c/ in perovskite oxide compounds is explained in the framework of the anharmonic model for superconductors with structurally unstable lattices. It is shown that anharmonic local excitations with fluctuation amplitudes much greater than harmonic vibrations amplitudes lead to a considerable enhancement of the coupling constant λ. The obtained estimations for T/sub c/ are in agreement with experimental data for La(Y)BaCuO systems. 17 refs.

38726 **(LBL—24111) Properties of new low dimensional materials and mechanisms of high T/sub c/ superconductivity.** Kresin, V.Z. (Lawrence Berkeley Lab., CA (USA)). Jul 1987. Contract AC03-76SF00098. 25p. (CONF-870766—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012026/JAW.

From International conference on high temperature superconductivity; Philadelphia, PA, USA (29 Jul 1987).

The new low dimensional high T/sub c/ superconductors are characterized by unusual vales of normal and superconducting parameters, by peculiar behavior of the thermal conductivity. It is possible to observe a multigap structure. High T/sub c/ is due to the coexistence of the phonon and plasmon mechanisms. Proximity systems containing high T/sub c/ superconductors are promising from the point of view of building a three-terminal device and obtaining a high critical current.

38727 **(LBL—25360) Research and development of superconductivity in the USA.** Clarke, J. (Lawrence Berkeley Lab., CA (USA)). May 1988. Contract AC03-76SF00098. 22p. (CONF-8805148—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88012016/JAW.

From 25. anniversary meeting of the Metal Mining Agency; Tokyo, Japan (27 May 1988).

In this paper, the author focuses his attention on the present and potential applications of superconductors -- both the classic low T/sub c/ superconductors such as niobium and its alloys and the new high-T/sub c/ materials. This discussion falls naturally into two broad areas: large scale applications such as magnets and power generators, and small scale applications such as ultrasensitive detectors of electromagnetic radiation and of tiny magnetic fields;

38728 **(NBI-HE—87-80) Observation of the Meissner effect in a lattice Higgs model.** Damgaard, P.H.; Heller, U.M. (Niels Bohr Inst., Copenhagen (Denmark); California Univ., Santa Barbara (USA). Inst. for Theoretical Physics). Dec 1987. 9p. (NSF-ITP—87-141i). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753282/JAW.

The lattice-regularized U(1) Higgs model in an external electromagnetic field is studied by Monte Carlo techniques. In the Coulomb phase of this model we demonstrate that magnetic flux can flow through uniformly, whereas in the Higgs phase two regions separate out: a type-II phase where magnetic flux can penetrate only in the form of vortices, and a type-I phase where the magnetic flux is completely expelled. This is the relativistic analogue of the Meissner effect in superconductivity. Furthermore, we present numerical evidence that the Higgs region of the phase diagram dimin-

ishes as the magnetic field increases. This is the Higgs model analogue of the disappearance of the superconducting state in strong magnetic fields.

38729 **Theory of how to distinguish a scalar from a tensor order parameter in the high-T/sub c/ superconductors.** Brand, H.R.; Doria, M.M. (Center for Nonlinear Studies, MS-B258, Los Alamos National Laboratory, University of California, Los Alamos, New Mexico 87545). *Physical Review [Section] B: Condensed Matter;* **37**: No. 16, 9722-9725(1 Jun 1988).

Using generalized Ginzburg-Landau equations, we discuss the possibility that the high-T/sub c/ superconductors do not have a scalar, but a tensor order parameter. We propose experiments to distinguish between these two possibilities both with lattice anisotropy included. A tensor order parameter implies a splitting of the upper critical field for a given setup as well as the appearance of a transverse magnetic field, when a field is applied parallel to the crystal cell axes. Only for a single scalar, the product of coherence and penetration lengths is an invariant along the cell axes.

(Oak Ridge National Lab., TN (USA); Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)). Apr 1988. Contract AC05-84OR21400. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011013/JAW.

From European boundary element meeting; Brussels, Belgium (8 May 1988).

The (steady state) heat flow between two contacting solids is investigated utilizing an efficient new boundary element method for treating thin cavities. A significant advantage of this approach is that a (multidomain) decomposition of the region is avoided and the contact region remains an interior surface. Consequently, the discontinuous flux across the contact/non-contract boundary is not solved for directly and no special provisions for the singularity are required. These fluxes can be accurately obtained after the boundary integral equation has been solved and all boundary values are known. Calculations for a circular contact region are presented, and the results are compared against a known analytic solution. Since pevious work on this method has only considered interior cavities and the contact gap is a 'surface crack', the treatment of surface cracks will also be described. 15 refs., 8 figs.

From 22. annual seminar on theoretical physics; Durban, South Africa (14 Jul 1987).

Included in the constants of the motion of the classical Coulomb problem are the orbital angular momentum vector L and the Laplace-Runge-Lenz vector A/sub c/ and therefore the vector B/sub c/ = vector A/sub c/ x vector L.[1] Some of the conserved quantum-mechanical operators for this problem are vector L = vector r x vector p, the Pauli-Lenz vector A and the vectors B^{+-} = vector A x vector L[Planck constant(S +- 12)]$^{-1}$, S = (vector L^2Planck constant^2 + 14)$^{-1}$2. The last are defined such that the operators vector C^{+-} = A +- i vector B^{+-} are ladder operators for l in the eigenkets nlm>. It is shown that vector C^{+-} can be factorized in two different ways.

The problem of restorting a potential in Schroedinger equation through scattering data is considered. Stable, direct algorithm for its solution by means of Fourier transform is suggested. Numerical results for the Bargmann potentials are presented. 11 refs.; 3 tabs.

38756 **(LAPP-TH—199-87) 2d SUGRA: supersymmetric form of the effective action leading to the conformal anomaly.** Gieres, F.; McCabe, J. (Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules). Sep 1987. 7p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753969/JAW.

For the 2-dimensional (1.1) and (1.0) supergravity we construct the locally supersymmetric effective Lagrangian whose superconformal variation leads to the conformal anomaly.

38757 **(NORDITA—87/69-P-Prepr.) Note on Bell's inequalities for stochastic hidden variables theories.** Oegren, M. (Nordisk Inst. for Teoretisk Atomfysik, Copenhagen (Denmark)). 1987. 24p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753289/JAW.

We have derived Bell's inequalities for a Bell-Bohm singlet spin system when the correlation is not perfect, under assumptions that are weaker than determinism or microscopic factorizability.

38758 **(UCID—20972) Wave equations for pulse propagation.** Shore, B.W. (Lawrence Livermore National Lab., CA (USA)). 24 Jun 1987. Contract W-7405-ENG-48. 31p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011760/JAW.

Theoretical discussions of the propagation of pulses of laser radiation through atomic or molecular vapor rely on a number of traditional approximations for idealizing the radiation and the molecules, and for quantifying their mutual interaction by various equations of propagation (for the radiation) and excitation (for the molecules). In treating short-pulse phenomena it is essential to consider coherent excitation phenomena of the sort that is manifest in Rabi oscillations of atomic or molecular populations. Such processes are not adequately treated by rate equations for excitation nor by rate equations for radiation. As part of a more comprehensive treatment of the coupled equations that describe propagation of short pulses, this memo presents background discussion of the equations that describe the field. This memo discusses the origin, in Maxwell's equations, of the wave equation used in the description of pulse propagation. It notes the separation into lamellar and solenoidal (or longitudinal and transverse) and positive and negative frequency parts. It mentions the possibility of separating the polarization field into linear and nonlinear parts, in order to define a susceptibility or index of refraction and, from these, a phase and group velocity. The memo discusses various ways of characterizing the polarization characteristics of plane waves, that is, of parameterizing a transverse unit vector, such as the Jones vector, the Stokes vector, and the Poincare sphere. It discusses the connection between macroscopically defined quantities, such as the intensity or, more generally, the Stokes parameters, and microscopic field amplitudes. The material presented here is a portion of a more extensive treatment of propagation to be presented separately. The equations presented here have been described in various books and articles. They are collected here as a summary and review of theory needed when treating pulse propagation.

38759 **(UCRL—98822) Staggered-grid finite element solution technique for the Maxwell's equations in the time domain.** Lee, R.L.; Madsen, N.K. (Lawrence Livermore National Lab., CA (USA)). May 1988. Contract W-7405-ENG-48. 8p. (CONF-8806147—1). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011731/JAW.

From 1. Woodward conference on wave phenomena theoretical, computational and practical aspects; San Jose, CA, USA (2 Jun 1988).

In this paper, the authors present a two-dimensional Galerkin finite element formulation of the Maxwell's equations in the time domain. The Galerkin element integrals are computed analytically and an explicit forward-backward time integration scheme is employed for advancing the resulting set of ordinary differential equations in time. The authors will compare two formulations of the simple 4-node bilinear element: (i) an equal-order interpolation element in which both the electric field and the magnetic field are approximated by bilinear basis functions; and (ii) a mixed-interpolation element in which the electric field is approximated as piecewise constant and the magnetic field as piecewise bilinear functions. The mixed formulation may be viewed as a finite element analog to certain staggered finite difference representations. Numerical examples will be presented to evaluate the accuracy of these two elements.

38760 **Evolving geometric phase and its dynamical manifestation as a frequency shift: An optical experiment.** Simon, R.; Kimble, H.J.; Sudarshan, E.C.G. (The Institute of Mathematical Sciences, C.I.T. Campus, Madras 600chemical bond113, India). *Physical Review Letters;* **61**: No. 1, 19-22(4 Jul 1988).

We show that an evolving geometric phase induces a frequency shift. We report an optical experiment where we employ this effect to offset the frequency of a laser beam.

38761 **Theory of laser beam apodization with a graded random phase window.** Haas, R.A. (University of California-Davis, Department of Applied Science, Livermore, California 94550). *Applied Optics;* **27**: No. 13, 2708-2718(1 Jul 1988).

Analysis indicates that graded random phase modulation can be used to apodize a laser beam. In the case of an obscuration or hard edge, it can prevent the formation of Fresnel diffraction ripples. For example, suppose laser radiation of wavelength Σ interacts with a central obscuration of halfwidth a followed immediately by a window. If the exit surface of the window is randomly modulated with a Gaussian amplitude transverse correlation length l and a mean square amplitude $\sim(t^2)$ (r) that decreases smoothly from a peak height at the obstacle of $\sim\Sigma^2$ with a transverse scale length L } a >> l, then the Fresnel diffraction ripples normally produced by the obscuration are eliminated. Following the apodizer the laser beam consists of two components. One is widely scattered with mean intensity I-bar/sub s/. The other is essentially unscattered and apodized with mean intensity I-bar/sub a/. The scattered light has an angular divergence proportional to Σ/l. The apodizer intensity transmission is T/sub a/ = exp[-$\alpha^2 \sim(t^2)$= (r)], where $\alpha = 2\pi(n - 1)/\Sigma$ and n is the window refractive index. Tayloring $\sim(t^2)$ (r) can produce desired apodization profiles for hard edges and obscurations. Interference between the scattered and unscattered radiation produces intensity fluctuations on the laser beam that have the characteristics of laser speckle. The magnitude of these fluctuations is greatest near the apodizer and at the edge of the apodized beam. The local intensity probability density of the fluctuations is approximately the modified Rician density.

38762 **Self-organized criticality.** Bak, P.; Tang, C.; Wiesenfeld, K. (Department of Physics, Brookhaven National Laboratory, Upton, New York 11973). *Physical Review [Section] A: General Physics;* **38**: No. 1, 364-374(1 Jul 1988).

We show that certain extended dissipative dynamical systems naturally evolve into a critical state, with no characteristic time or length scales. The temporal "fingerprint" of the self-organized critical state is the presence of flicker noise or 1/f noise; its spatial signature is the emergence of scale-invariant (fractal) structure.

38763 **Statistical entropy and a qualitative gas-liquid phase diagram.** Wallace, D.C. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545). *Physical Review [Section] A: General Physics;* **38**: No. 1, 469-472(1 Jul 1988).

For a classical monatomic fluid, gas and liquid phases are differentiatedon the basis of their statistical-mechanical entropy expressions. In the customary picture of a gas, each particle is first

allowed to move independently over the entire volume; interactions are then introduced, and the configurational entropy becomes 1 minus the interaction corrections. In a liquid, the configurational entropy is assumed to be dominated by correlations, and is expressed as S/sup (2)/ plus higher-order correlation corrections, where the two-particle term S/sup (2)/ is of order -2. For liquid argon at 85 K on the saturation curve, S/sup (2)/ is evaluated from the measured radial distribution function, and the entropy is accurately given by liquid statistical theory, with the higher-order correlation corrections being approximately 13% of the magnitude of S/sup (2)/. A qualitative gas-liquid phase diagram is drawn for a classical monatomic fluid.

38764 Standard form of four-dimensional symplectic quadratic maps. Mao, J. (Department of Physics, University of Houston, Houston, Texas 77004). *Physical Review [Section] A: General Physics;* 38: No. 1, 525-526(1 Jul 1988).

It is shown that all four-dimensional symplectic quadratic maps generated by a generating function should be in a form that can be transformed into two coupled (two-dimensional) Henon maps. The latter is called the standard form of the four-dimensional symplectic quadratic map.

38765 Cyclotron motion in a Penning trap microwave cavity. Brown, L.S.; Gabrielse, G.; Tan, J.; Chan, K.C.D. (Department of Physics, FM-15, University of Washington, Seattle, Washington 98195). *Physical Review [Section] A: General Physics;* 37: No. 11, 4163-4171(1 Jun 1988).

The cavity shifts in the cyclotron motion of a charged particle in a hyperbolic Penning trap are described using a numerical evaluation of the cavity-mode structure. The frequency shifts are about half as large in the hyperbolic cavity as in a cylindrical cavity of equivalent size. However, this still implies an error in the g-2 experiment that is easily five times the present statistical uncertainty. To account for slit electrodes and imperfect tolerances in existing traps, experimental measurements of the mode structure are still needed. The resonant frequencies of a microwave cavity can be measured very precisely. We show here that an accuracy of 10% in the measurements of certain coupling constants is sufficient to compute the shifts for the g-2 experiment at the level of one part in 10^9.

38766 Three-state systems driven by resonant optical pulses of different shapes. Carroll, C.E.; Hioe, F.T. (Department of Physics, St. John Fisher College, Rochester, New York 14618). *Journal of the Optical Society of America B: Optical Physics;* 5: No. 6, 1335-1340(Jun 1988).

New analytic solutions to the problem of a three-state system driven simultaneously by resonant optical pulses of different shapes are presented. The solutions are useful for prescribing the conditions for complete population transfer from one state to another or for complete population return.

38767 Statistical and signal processing concepts in surface metrology. Church, E.L.; Takacs, P.Z. (USA ARDEC, Dover, NJ (US)). pp 107-115 of Optical manufacturing, testing and aspheric optics. Sanger, G.M. Bellingham, WA; SPIE Society of Photo-Optical Instrumentation Engineers (1986). (CONF-860366—).

From SPIE technical symposium on applications of artificial intelligence; Orlando, FL, USA (31 Mar 1986).

This paper proposes the use of a simple two-scale model of surface roughness for testing and specifying the topographic figure and finish of synchrotron-radiation mirrors. In this approach the effects of figure and finish are described in terms of their slope distribution and power spectrum, respectively, which are then combined with the system point spread function to produce a composite image. The result can be used to predict mirror performance or to translate design requirements into manufacturing specifications. Pacing problems in this approach are the development of a practical long-trace slope-profiling instrument and realistic statistical models for figure and finish errors.

70 FUSION ENERGY

38768 (INIS-mf—11221) Book of abstracts. (Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). Fakulta Jaderna a Fysikalne Inzenyrska). 22 Apr 1987. 249p. (CONF-8705172—). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88702803/JAW.

From 18. European conference on laser interaction with matter; Prague, Czechoslovakia (4 May 1987).

The document contains abstracts of 24 review papers, 24 invited papers, 24 oral contributions and 120 posters. 10 review papers summarize the status of laser fusion research and progress in high-power laser facilities in major world laboratories. Four papers review research programs (laser-matter interaction studies and X-ray source development) based on KrF laser systems. Other review papers discuss the problems of laser energy conversion into X-rays in laser-heated cavities, X-ray lasing at shorter wavelengths, optimization of targets for inertial fusion. Two review papers are devoted to light ion fusion. The subjects of most invited papers are special problems of current laser plasma research, such as hot electron generation, nonlinear resonance absorption, energy accumulation limits, pellet ignition, conversion of laser light into X-rays, high-pressure plasma generation. Three invited papers review laser plasma research in Czechoslovakia, Poland and Spain. One paper suggests a new method of producing muonic superdense matter. The remaining inivited papers deal with the progress in XUV lasers and with laser plasma applications for further laser development. Of the papers accepted for oral presentation 12 papers discuss various problems of laser-plasma interaction; 4 papers deal with laser targets, 4 papers with laser-initiated X-ray sources, 3 papers with the diagnostics of laser-produced plasma. The last oral contribution presents the main principles of the excimer laser theory. The largest group of posters is related to laser-plasma interaction and energy absorption problems, to laser-target interaction and various methods of laser plasma diagnostics. The other posters deal with plasma applications in laser development, plasma mirrors, Brillouin and Raman scattering, X-ray emission, harmonic generation, electron acceleration, production of high-Z plasmas and other related problems. (J.U.).

38769 (JET-R—87-06) Results of the Joint European Torus. Green, B.J. (Commission of the European Communities, Abingdon (UK). JET Joint Undertaking). 1987. 39p. (CONF-870515—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753516/JAW.

From Spring college on plasma physics; Miramare, Italy (25 May 1987).

The paper is a lecture given to the Spring College on Plasma Physics at the International Centre for Theoretical Physics, Trieste, Italy, 1987. The lecture aims to present a restricted number of results of a few major studies performed on JET in the period mid 1983 to the end of 1986. The studies concern impurities in the plasma, density limit and disruptions, and energy confinement. Various developments planned for the future operation of JET are also outlined. (U.K.).

38770 (JET-R—87-13) Inquiry on nuclear fusion for peaceful uses by the 12th Committee of Industry of the Italian Parliament. Statement presented by Enzo Bertolini on 18th December 1986. Bertolini, E. (Commission of the European Communities, Abingdon (UK). JET Joint Undertaking). 1987. 44p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753517/JAW.

The paper is a statement by the author to the 12th Committee of Industry of the Italian Parliament concerning the Inquiry on nuclear fusion for peaceful uses. The basis concepts of thermonuclear fusion are outlined. A description is given of the European Programme, and the role of the JET Project within that Programme. The role of the JET Project in the field of fusion research is described, in detail. Preliminary answers to the Committee's questions on fusion posed previously are also reported. (U.K.).

38771 (ANL/FPP/TM—221) Bootstrap currents in radio-frequency-driven tokamak equilibria. Hsiao, Ming-Yuan; Ehst, D.A.; Evans, K. Jr. (Argonne National Lab., IL (USA). Fusion Power Program). May 1988. Contract W-31109-ENG-38. 36p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011136/JAW.

Interest in the bootstrap current arising from neoclassical transport in tokamaks has increased recently in view of certain experimental observations. In this study, the bootstrap current is calculated for a number of rf current-driven tokamaks. Two-dimensional, self-consistent, steady-state tokamak MHD equilibria are obtained by including both the transport-driven bootstrap current and the externally driven rf current. The self-consistency is acomplished by iterating between two-dimensional MHD equilibrium calculations and the current calculations (including bootstrap and rf ray-tracing). Calculations for other reactor parameters of interest are also carried out. It is found that for reactor-grade plasmas, the bootstrap current contribution to the toroidal current is, in general, important. An approxiamte scaling law for Γ, based on parametric survey performed, is also obtained. 16 refs., 8 figs., 1 tab.

38772 (CEA-CONF—9182) Energy balance and transient responses in wave driven plasmas. Rax, J.M. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). Jun 1987. 5p. (CONF-870629—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88752556/JAW.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

In a current-drive experiment with a RF power source, a certain amount of power is absorbed by resonant electrons. From the electrons, energy can flow through four channels: it can be converted into magnetic work when the electron interacts with an electric field, or it can be converted into heat when the electron collides the thermal plasma. In addition, there exists also the conversion of the low frequency RF energy into high frequency non thermal free-free or cyclotron radiation. Efficiencies of these conversions are considered together with the turn-on times of the associated responses.

38773 (CEA-CONF—9183) Potentiality of fast wave current drive in non-Maxwellian plasmas. Moreau, D.; O'Brien, M.R.; Cox, M.; Start, D.F.H. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). Jun 1987. 4p. (CONF-870629—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88752557/JAW.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

After a short analysis of the available experimental data on pure fast wave electron current drive we propose a theoretical scaling law for the wave absorption through combined electron Landau damping and transit time magnetic pumping. We then present the result of a fully relativistic calculation which we apply to a bi-Maxwellian electron distribution function and conclude on the requirements to be fulfilled by the energetic tail for obtaining significant damping in Tore-Supra.

38774 (CEA-CONF—9195) Effect of magnetized collisions on classical and neociassical transport. Ghendrih, P.; Samain, A.; Misguich, J.H. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). 1987. 4p. (CONF-870629—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753452/JAW.

From 14. European conference on controlled fusion and plasma physics; Madrid, Spain (22 Jun 1987).

In current tokamak experiments the electron Larmor radius rho/sub e/ is of the order or smaller than the Debye screening length λ/sub D/. Therefore the Larmor trajectories should lead to significant changes of the collision contribution to the transport coefficients. These changes can be understood as the balance between two opposite effects, with on one hand an enhancement due to increased interaction times (confinement effect) and on the other hand an inhibition of transverse exchanges since the magnetic momentum is constant for magnetized collisions (the interaction scale is larger than the Larmor radius. As a consequence a precise and detailed study is necessary to obtain the exact magnetic dependence induced by the Larmor trajectories effects.

38775 (CIEMAT—610) Study of TJ-1 Tokamak plasmas with Thomson scattering and radiation diagnostics. Pardo, C.; Zurro, B. (Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas, Madrid (Spain)). Jun 1987. 166p. (In Spanish). NTIS (US Sales Only), PC A08/MF A01. Order Number DE88702841/JAW.

The Thomson scattering system of TJ-1 is described in detail. The radial profiles of T/sub e/ and n/sub e/ óbtained in TJ-1 discharges are presented. This data makes possible to deduce characteristic parameters of the plasma confinement in this machine, as energy confinement times, Z/sub eff/ B. Using also radiation measurements (global and in the visible range) we obtained the particle confinement time and Z/sub eff/ without non experimental assumptions. (author) 56 figs., 52 refs.

38776 (CONF-880363—3) Linear ideal MHD stability calculations for ITER. Hogan, J.T. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 116p. NTIS, PC A06. Order Number DE88011012/JAW.

From Fusion Energy Division information meeting; Oak Ridge, TN, USA (9 Mar 1988).

A survey of MHD stability limits has been made to address issues arising from the MHD--poloidal field design task of the US ITER project. This is a summary report on the results obtained to date. The study evaluates the dependence of ballooning, Mercier and low-n ideal linear MHD stability on key system parameters to estimate overall MHD constraints for ITER. 17 refs., 27 figs.

38777 (CONF-880398—1-Vugraphs) Detailed modeling of spectroscopic data: Modeling support for ORNL PMI WORK: TEXTORALT-II, TORE SUPRA, ATF. Hogan, J.; Klepper, C.; Hillis, D.; Uckan, T. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 32p. NTIS, PC A03;3. Order Number DE88009701/JAW.

From US-Japan workshop on limiter and divertor tokamaks; Los Angelos, CA, USA (21 Mar 1988).

This paper contains vugraphs on particle source effects on confinement time scaling. Detailed modeling of H/sub α/ intensity spatial distribution is discussed. (LSP)

38778 (CONF-880512—3) Modeling of spectroscopic measurements of edge recycling. Hogan, J.; Klepper, C.; Hillis, D.; Uckan, T. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 26p. NTIS, PC A03;3. Order Number DE88010135/JAW.

From 8. international conference on plasma surface interactions in controlled fusion devices; Julich, F.R. Germany (2 May 1988).

The study of confinement scaling with plasma parameters requires, in general, modeling of the input sources of particles and energy. We investigate modeling issues important for understanding the scaling of particle confinement with density; a scaling which depends on knowledge of the variation of the fuelling profile. By detailed fitting of the poloidal variation of H/sub α/ light from a density scaling sequence of TEXT discharges at fixed B/sub T/ and I/sub p/, we are able to calculate the variation in mean ionisation radius as density is varied for a typical scaling sequence. Variation of several free parameters are required for calculations such as this, so we have examined the feasibility of reducing the number of parameters by modeling velocity-space resolved data. Three dimensional Monte Carlo calculations of the H{sub{alpha}} lineshape are presented, including Doppler broadening and Zeeman splitting effects. Many important confinement studies are conducted in 'carbonised' devices. We have studied the problem of determining the fuelling profile in carbon-rich plasmas by calculating the H_α deposi-

tion due to CH_4 breakup, and by carrying out experiments in the ORNL Plasma Materials Interaction Test Facility to measure the H/sub α/ lineshape in discharges with CH_4 injection into pure D_2 plasmas.

38779 (CONF-880512—4) Experimental investigation of the natural divertor configuration in Heliotron-E. Hillis, D.L.; Mioduszewski, P.K.; Fowler, R.H.; Rome, J.A.; Motojima, O.; Mizuuchi, T.; Noda, N.; Mutoh, T.; Zushi, H.; Takahashi, R.; Obiki, T.; Iiyoshi, A.; Uo, K. (Oak Ridge National Lab., TN (USA); Kyoto Univ., Uji (Japan). Plasma Physics Lab.). 1988. Contract AC05-84OR21400. 20p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010444/JAW.

From 8. international conference on plasma surface interactions in controlled fusion devices; Julich, F.R. Germany (2 May 1988).

Particle control with pump limiters and divertors has been successfully demonstrated in a number of present-day tokamaks. In a heliotron/stellarator configuration, plasma flows to the wall in distinct flux bundles, often called "divertor stripes". This complicated three-dimensional characteristic of the plasma edge presents a new challenge for active particle control systems such as pump limiters and divertors. The experiment described here has obtained data with an instrumented pump particle collector that is located in the "natural" magnetic divertor stripe of Heliotron-E. The particle collector consists of a moveable graphite assembly with single-sided particle collection and active pumping. By scanning the particle collector assembly through the plasma edge of Heliotron-E, the divertor stripe is observed to be about 2-3 cm (FWHM) in width, and pressure rises of 0.01-0.01 mTorr are observed in the particle collector pumping chamber. These measurements have demonstrated that particles leaving the bulk plasma via the divertor stripes can be collected and provide a basis for developing a divertor scheme for particle control in helical systems. Modelling of the Heliotron-E magnetic configuration at the plasma edge is used to determine the collection efficiency of the particle collector in the divertor stripes. The modeling is further extended to describe a helical divertor concept. 18 refs., 6 figs.

38780 (CONF-880534—5) Current drive and heating systems based on high-energy (1- to 3-MeV) negative ion beams. Becraft, W.R.; Akerman, M.A.; Haselton, H.H.; Murphy, B.D.; Lousteau, D.C.; Ryan, P.M.; Whealton, J.H.; McMichael, G.E.; Schempp, A. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010128/JAW.

From 15. European conference on controlled fusion and plasma heating; Dubrovnik, Yugoslavia (16 May 1988).

This paper describes a concept for a current drive system based on negative ions with beam energy > 1 MeV. Preliminary physics calculations show that the core current necessary for stability enhancement can best be achieved by beams with energy ranging from 1 to 4 MeV. Further study and experiments will better define the optimum energy. Work under way at Oak Ridge National Laboratory (ORNL) and at collaborating institutes in Canada and the Federal Republic of Germany is defining a system, its elements, a configuration and operational scenarios deemed appropriate for such devices as ITER and other future steady-state tokamaks, and the requisite research and development to provide such a system. 7 refs., 2 figs.

38781 (CONF-8804103—2-Vugraphs) Ideal low-n and Mercier mode stability boundaries for $1 = 2$ torsatrons. Dominguez, N.; Leboeuf, J.N.; Carreras, B.A.; Lynch, V.E. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009872/JAW.

From Sherwood theory conference; Gatlinburg, TN, USA (18 Apr 1988).

We have studied the relationship between the stability properties of ideal low-n internal modes and the 3-D ideal Mercier criterion for $1 = 2$ torsatron configurations. For the low-n stability studies, the stellarator expansion has been used as implemented in the FAR code. The 3-D Mercier criterion has been applied to the equilibria calculated with the VMEC code. This investigation has been carried out for several torsatron configurations, exploring a broad range of aspect ratios, and different pressure profiles. We find that: 1) the low-n modes with singular surfaces lying in a Mercier region are in general unstable, and 2) the critical β given by the Mercier criterion agrees well with the critical β for the lowest n unstable mode. This is verified even in the case of global $n = 1$ modes. Therefore, the 3-D Mercier criterion is a useful guide in mapping the ideal stability β limits for these torsatron configurations. 12 figs.

38782 (CONF-8804103—3-Vugraphs) Full-wave calculations in flux coordinates for toroidal geometry. Carreras, B.A.; Lynch, V.E.; Jaeger, E.F.; Batchelor, D.B. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 18p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010131/JAW.

From Sherwood theory conference; Gatlinburg, TN, USA (18 Apr 1988).

A new 2-D full-wave code, HYPERION, employing a poloidal and toroidal mode expansion and including the toroidal terms arising in the wave equation has been developed. It is based on the existing modules developed for the MHD stability codes and uses as input the tokamak equilibria calculated with the RSTEQ code. At present the plasma response is described by the collisionally broadened cold plasma conductivity. However, the code is written in straight field line coordinates, this permits the accurate representation of k /sub {parallel/} and as a consequence allows the incorporation of the plasma Z functions. This code also retains the E/ sub {parallel/} component of the electric field which will allow the study of the low density region of the plasma. We have done detailed benchmarking of the HYPERION code in the cold plasma limit with the existing finite difference ORION full-wave code. The agreement is very good.

38783 (CTH-IEFT/PP—1987-03) Solutions of reaction-diffusion integral equations describing explosive evolution of densities for localized structures. Wilhelmsson, H. (Chalmers Univ. of Tech., Goeteborg (Sweden). Inst. for Electromagnetic Field Theory and Plasma Physics). 1987. 11p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752488/JAW.

Reaction-diffusion integral equations are studied with special regard to explosive-type solutions. Certain localized structures can grow explosively in time without change in spatial structure. The characteristic shapes can be described in terms of elliptic functions.

38784 (DOE/ER/13787—T1) Investigation of parameters critical to muon-catalyzed fusion: Research continuation proposal. Jones, S.E.; Palmer, E.P.; Rees, L.W.; Li, Ping; Sheely, E.; Shurtleff, K.; Taylor, S.; Thorne, J.M.; Anderson, A.N. (Brigham Young Univ., Provo, UT (USA). Dept. of Physics and Astronomy; Brigham Young Univ., Provo, UT (USA). Dept. of Chemistry; Idaho Research, Inc., Idaho Falls (USA)). 10 May 1988. Contract FG02-87ER13787. 14p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010959/JAW.

We have demonstrated (in conjunction with our colleagues) that muon catalysis cycling rates increase rapidly with increasing deuterium-tritium gas temperatures and densities. Furthermore, muon-capture losses are significantly smaller than predicted before the experiments began, although recent theoretical work narrows the gap between theory and observation. As a result of these effects, we have been able to achieve muon-catalyzed fusion yields of 150 fusions/muon (average). The fusion energy thereby released, nearly 3 GeV/muon, significantly exceeds theoretical expectations, and still higher yields are expected. New theoretical predictions of higher fusion yields in low-temperature plasmas and d-t gases with large applied magnetic fields stimulate further investigation. We are exploring the limits of muon-catalyzed fusion, to provide answers to questions regarding energy applications of muon-catalyzed fusion. 13 refs., 3 figs.

38785 (DOE/ER/52147—1) Free electron lasers with small period wigglers: Progress report for the period September 15, 1987 to September 14, 1988. Granatstein, V. L.; Antonsen, T. M. Jr.; Booske, J. H.; Destler, W. W.; Mayergoyz, I. D.; Ott, E. (Maryland Univ., College Park (USA)). Jun 1988. Contract FG05-87ER52147. 38p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011627/JAW.

The focus of the overall program is to develop short period wiggler (SPW) free electron lasers (FELS) as an alternate source of high-average-power millimeter wave radiation for electron cyclotron resonance heating (ECRH) in advanced magnetic fusion experiments such as the Compact Ignition Torus. Research progress to date is summarized with details described. So far, all of our studies have provided evidence which supports the feasibility of the SPW FEL concept. This includes investigations of sheet beam propagation and stability, thermal stability of the rf cavity under CW operation, and nonlinear evolution of {endash} and competition between {endash} multiple aixal modes. The eventual goal of our program is to develop a 1.0 MW, CW-compatible SPW FEL operating near one millimeter wavelength. The near term goals are to demonstrate proof-of-principle in a pulsed system (1.5 μs pulse length) and to identify solutions to additional problems that a long pulse (i.e., 3 sec) or CW system might encounter. A new two year research program is proposed beginning in September 1988. The culmination of this program will be the proof-of-principle experiment, which we propose will commence operation in the beginning of calendar year 1990.

38786 (DOE/ER/53202—T5) Theoretical studies of controlled fusion: Final report. Krall, N.A. (JAYCOR, San Diego, CA (USA)). 31 Jul 1987. Contract FG03-85ER53202. 15p. (J—530-87-737/2442). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010235/JAW.

This report summarizes the results of a study of low frequency stability in the Field Reversed Configuration (FRC), with emphasis on the transport resulting from this stability behavior. 11 refs., 5 figs., 2 tabs.

38787 (DOE/ER/53212—121) Reminimization of energy integral and stability limit for non-ideal MHD (magnetohydrodynamic) plasma. Kondoh, Y. (Wisconsin Univ., Madison (USA). Dept. of Physics). Mar 1988. Contract FG02-85ER53212. 24p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008422/JAW.

The stability condition of relaxed states is derived from the energy principle for the non-ideal MHD plasma. An Euler equation for the reminimization of energy integral is derived and shown to give the marginal stable, non-singular perturbations for the stability condition. An extended stability limit for the $\beta = 0$ relaxed states is derived from the stability condition, with use of the eigenvalue analysis for the Euler equation. By using the perturbation method, the extended stability limit is solved in the 1st order approximation to explain the deviation of the experimental stability limit from the idealized stability limit by Taylor. A procedure to get overall stability limit against both the non-singular and the singular perturbations is discussed. 25 refs.

38788 (DOE/ER/53218—120) Numerical simulations of resistive magnetohydrodynamic instabilities in a poloidal divertor tokamak. Uchimoto, E. (Wisconsin Univ., Madison (USA)). Mar 1988. Contract FG02-86ER53218. 109p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010768/JAW.

A new 3-D resistive MHD initial value code RPD has been successfully developed from scratch to study the linear and nonlinear evolution of long wavelength resistive MHD instabilities in a square cross-section tokamak with or without a poloidal divertor. The code numerically advances the full set of compressible resistive MHD equations in a toroidal geometry, with an important option of permitting the divertor separatrix and the region outside it to be in the computational domain. A severe temporal step size restriction for numerical stability imposed by the fast compressional waves was removed by developing and implementing a new, efficient semi-implicit scheme extending one first proposed by Harned and Kerner. As a result, the code typically runs faster than that with a mostly explicit scheme by a factor of about the aspect ratio. The equilibrium input for RPD is generated by a new 2-D code EQPD that is based on the Chodura-Schluter method. The RPD code, as well as the new semi-implicit scheme, has passed very extensive numerical tests in both divertor and divertorless geometries. Linear and nonlinear simulations in a divertorless geometry have reproduced the standard, previously known results. In a geometry with a four-node divertor the m = 2,n = 1 (2/1) tearing mode tends to be linearly stabilized as the q = 2 surface approaches the divertor separatrix. However, the m = 1,n = 1 (1/1) resistive kink mode remains relatively unaffected by the nearness of the q = 1 surface to the divertor separatrix. When plasma current is added to the region outside the divertor separatrix, the 2/1 tearing mode is linearly stabilized not by this current, but by the profile modifications induced near the q = 2 surface and the divertor separatrix. A similar stabilization effect is seen for the 1/1 resistive kink mode, but to a lesser extent. 77 refs., 91 figs.

38789 (DOE/ER/53227—119) Tokamak magnetic turbulence over the safety factor range $0.6 < q < 3$. Graessle, D.E.; Prager, S.C.; Dexter, R.N. (Wisconsin Univ., Madison (USA). Dept. of Physics). Mar 1988. Contract FG02-86ER53227. 17p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008421/JAW.

Magnetic turbulence (ν<400kHz) has been measured both internal and external to a tokamak plasma as the edge q is varied from 0.6 to 3. The radial and poloidal spatial dependence fo the coherence is investigated. The spatial and frequency dependence of the fluctuations are similar over the wide range of q. 10 refs., 7 figs.

38790 (DOE/ET—53088-312) Drift wave vortices and anomalous transport. Horton, W. (Texas Univ., Austin (USA). Inst. for Fusion Studies). Apr 1988. Contract FG05-80ET53088. 40p. (IFSR—312). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009562/JAW.

Theory and computer simulations are used to describe the inelastic vortex-vortex and vortex-wave interactions that lead to the quasi-coherent transport of plasma across the magnetic field. Monopole and dipole drift wave vortices with radii r_0 large compared with the ion inertial scale length {rho}/sub s/ are shown to produce transport at the rate un/sub v/$\int d\sigma(b) \leq$ n/sub v/v/sub de/τ/sub o/ where n/sub v/ is the vortex line density and $d\sigma(b)$ is the inelastic collision cross-section for impact parameter b. The transport during collisions and mergings is evaluated from the evolution of a passively convected scalar concentration of test particles. 24 refs., 4 figs.

38791 (DOE/ET/53059—T1) Multiple mirror experiment (MMX): Final report, November 15, 1973-March 24, 1986. Lichtenberg, A.J.; Lieberman, M.A. (California Univ., Berkeley (USA). Electronics Research Lab.). Feb 1987. Contract AS03-76ET53059. 5p. NTIS, PC A02/MF A01; GPO Dep. Order Number DE88008141/JAW.

This paper briefly discusses the accomplishments and developments on the multiple mirror confinement device. (LSP)

38792 (ENEA-RT-FUS—87-22, pp 25-30) Propagation of LH waves in plasma in presence of M=1.2 magnetic island. Romanelli, F.; Cardinali, A.; Bartiromo, R. (ENEA, Frascati (Italy). Centro Ricerche Energia). 1987. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701801/JAW. (CONF-8708235—).

From International school of plasma physics; Varenna, Italy (24 Aug 1987).

The effect of magnetic islands on the propagation of lower hybrid waves is investigated by using a recently developed asymptotic technique which allows explicit analytical solutions of the problem. Near the mode rational surface the model equilibrium is a slab with a single helicity perturbation corresponding to a m=1 or m=2 island. Particular attention is focused on the deformation of the wave trajectory and on the variation of the parallel component of the wavevector inside the island which can affect tha local absorption of the wave.

38793 (ENEA-RT-FUS—87-22, pp 5-23) **Microinstability based models of anomalous energy transport.** Romanelli, F. (ENEA, Frascati (Italy). Centro Ricerche Energia). 1987. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701801/JAW. (CONF-8708235—).

From International school of plasma physics; Varenna, Italy (24 Aug 1987).

A model is presented for the anomalous transport which relies on the effect of the semicollisional microinstabilities driven by the trapped electron dynamics and by the combined effect of temperature gradients and curvature. Upon using the results of a general stability analysis of such modes, the quasilinear transport coefficients are derived and compared to the general trends in transport. In particular, when used in steady-state transport codes the model correctly reproduces the results of ohmic experiments. The role of strongly collisional microinstabilities in affecting the edge transport is also discussed. 36 refs.

38794 (ENEA-RT-FUS—87-22, pp 31-34) **Density fluctuation in Tokamaks. A phenomenological approach.** Ottaviani, M. (ENEA, Frascati (Italy). Centro Ricerche Energia). 1987. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701801/JAW. (CONF-8708235—).

From International school of plasma physics; Varenna, Italy (24 Aug 1987).

Explaining the features of turbulent fluctuation spectra from fundamental theory is a very difficult task at present. Linear theory is useful when the instability sets in, but present experiments are not designed to investigate the transition to turbulence, but simply to study the properties of the turbulent state itself. Therefore, it is generally difficult to state which instabilities are responsible of the observed state. More over the theory of saturated turbulence seems itself not enough developped to give quantitative answers. In this work a phenomenological approach is pointed out. An attempt is to describe fluctuations around the observed (average) state by means of some equation for the fluctuating part of the density n(r,t). More precisely, essentially the power law behavior of correlation functions at large frequency and wavenumber is considered.

38795 **(EUR-CEA-FC—1314) Gravitational interchange instability when g.nablarhoo=0: part 1.** Paris, R.B. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). Sep 1987. 38p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753482/JAW.

The analogue of the Rayleigh-Taylor instability (gravitational interchange mode) for an infinitely conducting, approximately one-dimensional plane plasma slab is examined when the gravitational acceleration g is supposed to be perpendicular to the equilibrium density gradient nablarhoo. It is found that, in contrast with the classical situation (where g is aligned with nablarhoo). Furthermore, for a current layer with magnetic shear, the mode is unstable for all values of nablarhoo: there is no instability threshold equivalent to the Suydam criterion for the classical gravitational interchange mode. The characteristic growth rate of the instability is given by $\omega/\mathrm{sub}\ G/\sqrt{2}$, where $\omega/\mathrm{sub}\ G/ \simeq (gnablarhoo)^{1}2$ denotes the characteristic growth rate of the Rayleigh-Taylor instability, together with a small oscillatory frequency.

38796 **(EUR-CEA-FC—1333) Fast ion ripple losses during neutral injection in TFR.** Tuszewski, M.; Roubin, J.P. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). Dec 1987. 65p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88753483/JAW.

Fast ion ripple losses during neutral beam injection in TFR are measured near-quantitatively with an array of Faraday collectors mounted between two toroidal field coils. The collected currents show multiple evidence for fast ion ripple losses and correspond to global losses of 30-40% of the injected current. The measurements are complemented by a simple Fokker-Planck model, itself checked against Monte-Carlo simulations on several cases. These calculations clarify many experimental features but predict only about half of the observed ripple-lost current. This discrepancy could be due in part to various experimental and theoretical uncertainties although there are indications of some enhanced ripple losses in the experiments. Such losses could arise from other processes than toroidal field ripple not included in the calculations, and may suggest along with other diagnostics an enhanced depletion of central fast ions, the origin of which remains unclear. Fast ion ripple losses are calculated and observed to be fairly insensitive to factors of 2 variations in most plasma parameters. Substantial losses are predicted only when injecting near-perpendicular into a Tokamak plasma of edge $\geqq 1\%$.

38797 **(GA-A—19185) The DIII-D E{parallel}B charge exchange diagnostic.** Heidbrink, W.W. (General Atomics Co., San Diego, CA (USA)). Feb 1988. Contract AC03-84ER51044. 14p. (CONF-880364—25). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010830/JAW.

From 7. topical conference on high temperature plasma diagnostics; Napa, CA, USA (13 Mar 1988).

One of the neutral-particle spectrometers used on the Doublet III tokamak has been improved and modified for use as an active charge exchange diagnostic on the DIII-D tokamak. The spectrometer employs a He stripping cell, parallel {rvec E} and {rvec B} analyzer fields, and a microchannel plate detector sixty energy channels for each of two neutral particle masses. Improvements to the diagnostic include better radio frequency and gamma ray and complete instrumentation of all energy channels. Calibration results for H and D are similar to those reported previously. The instrument views across one of the DIII-D heating beams which can be modulated to provide local neutral doping. The analyzer is scanned shot-shot to measure neutrals with pitch angles between {approximately}5{degree} and {approximately}110{degree}. 34 refs., 5 figs.

38798 **(GA-A—19204) H-mode study in DIII-D.** Ohyabu, N.; Allen, S.; Brooks, N.H.; Bramson, G.; Burrell, K.H.; Callis, R.W.; Carlstrom, T.N.; Colleraine, A.P.; Content, D.; DeBoo, J.C.; Gohil, P.; Groebner, R.J.; Howl, W.; Hill, D.N.; Hong, R.M. (General Atomic Co., San Diego, CA (USA)). Mar 1988. Contract AC03-84ER51044. 11p. (CONF-880534—8). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011664/JAW.

From 15. European conference on controlled fusion and plasma heating; Dubrovnik, Yugoslavia (16 May 1988).

H-mode has been observed in DIII-D single null divertor discharges. Many observed features are similar to those of other devices. In this paper, we discuss new and detailed experimental findings mostly from DIII-D beam heated discharges. The H-mode transition requires a minimum input power and a minimum density. These minimum values depend on various plasma parameters. The detailed parametric dependence has not yet been established. However, H-mode accessibility is easiest for low B/sub T/, D-plasma with ion {gradient}B drift toward X-point. Under such conditions, the H-transition is achieved with low power (0.8 MW) ECH alone. Furthermore, a temporary H-mode phase, lasting {approximately}30 msec is triggered by a sawtooth crash in purely ohmically-heated, low q discharges. After the transition, the density profile becomes flat with a very steep edge gradient within several msec and further develops into a hollow profile. The average density continuously increases during entire H-phase until an Edge Localized Mode (ELM) occurs. On the other hand, the edge electron temperature rises rapidly from 200 eV to 350 eV within {approximately}50 msec after the transition and then saturates. 9 refs., 4 figs.

38799 **(GA-A—19218) MHD stability in high β/sub {Tau/} DIII-D divertor discharges.** Lao, L.L.; Strait, E.J.; Taylor, T.S.; Chu, M.S.; Burrell, K.H.; DeBoo, J.C.; Gohil, P.; Groebner, R.J.; Hsieh, C.L.; Howl, W.; Kellman, A.G.; Osborne, T.H.; Ozeki, T.; Stambaugh, R.D.; St. John, H.; Turnbull, A.D. (General Atomics Co., San Diego, CA (USA); Japan Atomic Energy Research Inst., Tokyo). Mar 1988. Contract AC03-84ER51044. 6p. (CONF-880534—7). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010587/JAW.

From 15. European conference on controlled fusion and plasma heating; Dubrovnik, Yugoslavia (16 May 1988).

Doublet III-D has achieved a β/sub {Tau/} of over 6% in H-mode divertor plasmas and has not exceeded the beta limit as allowed by ideal MHD instabilities. Experimental results of this test run are summarized. 4 refs., 4 figs. (DWL)

38800 (GA-A—19306) High β and ECRH studies in DIII-D. Stambaugh, R.; Allen, S.; Bramson, G.; Brooks, N.; Burrell, K.H.; Callis, R.; Carlstrom, T.; Chance, M.; Chu, M.; Colleraine, A. (Lawrence Livermore National Lab., CA (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.; Johns Hopkins Univ., Baltimore, MD (USA); Hitachi Ltd., Tokyo (Japan); Commission of the European Communities, Abingdon (UK). JET Joint Undertaking; Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). May 1988. Contract AC03-84ER51044;W-7405-ENG-48. 14p. (CONF-880534—9). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011911/JAW.

From 15. European conference on controlled fusion and plasma heating; Dubrovnik, Yugoslavia (16 May 1988).

The DIII-D high and low beta stability results have established the basic feasibility of the divertor and H-mode configurations up to elongation 2.0 for next generation tokamaks. The 6.8% β/sub T/ achieved has already exceeded projected operating requirements of next generation devices. β/sub T/ $>$ 6% has been sustained for 800 ms. Stability calculations and patterns of MHD mode behavior suggest a central expanding zone of ballooning instabilities leads ultimately to unstable m/n = 2/1 modes which cause beta collapse or disruption. The pressure gradient at the plasma edge just reaches the first regime ballooning limit prior to ELMs. ECRH has proven effective for generating H-mode, sawtooth suppression, and ELM suppression.

38801 (INFN/TC—88-1) High power CW electron beam for FEL devices. Boscolo, I.; Ciocci, F.; Dattoli, G. (Istituto Nazionale di Fisica Nucleare, Rome (Italy)). 1988. 9p. NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702278/JAW.

Electrostatic accelerators suitable for CW millimeter fir high power FEL are analyzed. The laser performances with main emphasis to the efficency and power output are also discussed. 28 refs.

38802 (IPP—III/130) Heating and confinement in the ion cyclotron range of frequencies on the divertor tokamak ASDEX. Steinmetz, K.; Niedermeyer, H.; Noterdaeme, J.M.; Wesner, F.; Wagner, F.; Baeumler, J.; Becker, G.; Becker, W.; Bosch, H.S.; Brambilla, M. (Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.); Association Euratom-Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.); Stuttgart Univ. (Germany, F.R.); AN SSSR, Leningrad. Fiziko-Tekhnicheskij Inst.; Nuclear Development Corp. of South Africa (Pty.) Ltd., Pelindaba, Pretoria; Washington Univ., Seattle (USA)). Jan 1988. 58p. Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.).

A summary of the experiments performed with ion cyclotron heating on ASDEX from November 1984 until March 1986 is given, and the most interesting results are reported and discussed in detail. Heating and confinement studies in the hydrogen second harmonic and hydrogen minority schemes (P/sub IC/ $<$ 2.6 MW, t/sub IC/ $<$ 1.5 sec) reveal a typical L-mode behaviour, i.e. a power dependent confinement degradation, which is rather similar to that found with neutral beam injection heating. ICRH is accompanied with a slightly improved particle and energy continement compared to NI, which still holds when ICRH and NI are combined up to P/sub tot/ $\simeq$ 4.5 MW absorbed in the plasma. Particular efforts have been devoted to investigations of the second harmonic regime in HD mixture plasmas of n/sub H/nϵ $\simeq$ 0.1 to 1 which turns out to exhibit a high heating potential under reactor relevant plasma conditions. The achievement of H-mode transitions with ICRH alone in the hydrogen minority scheme at an absorbed RF power of about 1.1 MW supports the indications of a unique confinement structure with auxiliary heating in tokamaks which appears to be widely independent of the additional heating method. ICRH-specific impurity problems such as the strong release of iron from the vessel walls have been overcome by applying extensive in-situ wall carbonisation. The mechanisms responsible for the impurity generation have partly been identified and analyzed, however, the problem still remains to be solved. Impurities preferentially released from the ICRH antenna do not pose a problem. With 65 refs..

38803 (IVO-A—06/87) Plasma technology. Preliminary studies 2. Bergring, C.; Sivusaari, T.; Jeskanen, R.; Halonen, A.; Saikkonen, J. (Imatran Voima Oy, Helsinki (Finland)). 1987. 108p. (In Finnish). NTIS (US Sales Only), PC A06/MF A01. Order Number DE88752815/JAW.

The report includes four preliminary studies based on literature and one preliminary study based on tests. 1. Raising and maintaining the temperature of the ladle and the melt using plasma 2. The use of plasma technology in cupolas 3. Raising the temperature of the blast furnace blast using plasma 4. The use of plasma technology in drying 5. Cleaning up hazardous waste using plasma technology. Study No. 1 deals with the applicability of plasma technology to raising and maintaining the temperature of the ladle. This technique improves the earlier methods but the equipment is still expensive. Study No. 2 deals with the ways of cutting production costs in cupolas using plasma technology. The process is best suited for the smelting of fine raw material and for increasing the smelting capacity. Study No. 3 deals with the effects of raising the blast furnace blast temperature on the properties and economy of the process. The use of electricity to only replace energy received from coke is uneconomical but it also has other advantages. Study No. 4 considers the applicability of air and steam plasma to the drying of pulp, and its economy. At the present price of electricity the process is uneconomical. Study No. 5 describes tests on decomposing liquid organic substances using plasma. The process is still being developed, and seems promising.

38804 (KFTI—87-37) Apparatus for submillimeter laser diagnostics of high-temperature plasma. Berezhnyj, V.L.; Kononenko, V.I.; Pavlichenko, O.S. (AN Ukrainskoj SSR, Kharkov. Fiziko-Tekhnicheskij Inst.). 1987. 33p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702464/JAW.

Constructions and characteristics of an HCN laser with RF discharge (RFD) and a CH_3OH laser pumped with a CO_2 laser radiation are presented. Scaling laws simplifying the RFD HCN design calculations with the given parameters are found. The CH_3OH-laser frequency-response curve, that essentially determines the main heterodyne laser interferometer characteristics, is investigated. Owing to high stability of the output power and frequency the present lasers can be used in heterodyne interferometers. The design and parameters of a low temperature submillimeter radiation detectors on the basis of InSb and GeLi crystals are described. The results of interferometer measurements at plasma devices by means of the given apparatus are presented. 26 refs.; 22 figs.; 2 tabs.

38805 (LA—11178-MS) Introduction to laser plasma diagnostics. Hauer, A.A.; Baldis, H.A. (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 45p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011056/JAW.

This report reviews optical and x-ray techniques for the diagnosis of laser-produced plasmas. Emphasis is placed on the parameter regimes (e.g., laser irradiance $> 10^{12}$ wattscm^2) appropriate to the laser fusion field. We also include, however, material related to other laser-plasma work such as chemical analysis. We intend this work to be an introduction to the basic physical principles involved in measurements. We also deal with the comparison of these measurements with modeling. A considerable number of specific examples of measurements are presented to illustrate the techniques described. 132 refs., 29 figs., 2 tabs.

38806 (LA-UR—88-1698) Monte Carlo alpha deposition. Talley, T.L.; Evans, F. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 4p. (CONF-880546—8). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010913/JAW.

From International conference on nuclear data for science and technology; Mito, Japan (30 May 1988).

Prior work demonstrated the importance of nuclear scattering to fusion product energy deposition in hot plasmas. This suggests careful examination of nuclear physics details in burning plasma simulations. An existing Monte Carlo fast ion transport code is being expanded to be a test bed for this examination. An initial extension, the energy deposition of fast alpha particles in a hot deuterium plasma, is reported. The deposition times and deposition ranges are modified by allowing nuclear scattering. Up to 10% of the initial alpha particle energy is carried to greater ranges and times by the more mobile recoil deuterons. 4 refs., 5 figs., 2 tabs.

38807 **(PPPL—2489) Particle diffusion in a spheromak.** Meyerhofer, D.D.; Levinton, F.M.; Yamada, M. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Jan 1988. Contract AC02-76CH03073. 19p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009350/JAW.

The local carbon particle diffusion coefficient was measured in the Proto S-1/C spheromak using a test particle injection scheme. When the plasma was not in a force-free Taylor state, and when there were pressure gradients in the plasma, the particle diffusion was five times that predicted by Bohm and was consistent with collisional drift wave diffusion. The diffusion appears to be driven by correlations of the fluctuating electric field and density. During the decay phase of the discharge when the plasma was in the Taylor state, the diffusion coefficient of the carbon was classical. 23 refs., 4 figs.

38808 **(PPPL—2490) Ion temperature by charge exchange neutral analysis from vertical sightlines on the Tokamak Fusion Test Reactor.** Fiore, C.L.; Medley, S.S.; Hammett, G.W.; Kaita, R.; Scott, S.D. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Dec 1987. Contract AC02-76CH03073. 29p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009351/JAW.

The Fokker-Planck code FPPRF is used to calculate the expected deuterium charge exchange flux along vertical sighlines from TFTR neutral-beam-injected discharges. The feasibility of obtaining central ion temperature measurements by fitting the spectra obtained from these sightlines at two energy regions--above the highest neutral beam injection energy (> 100 keV) and from 20-80 keV--is investigated. It is demonstrated that the central ion temperature can be obtained from the central vertical slightline for fitting the high energy data. The deuterium neutral particle flux energy distribution below the neutral beam injection energy is insentive to the code input ion temperature, however. 6 refs., 12 figs., 1 tab.

38809 **(PPPL—2493) Mode particle resonances during near-tangential neutral beam injection in large tokamaks.** Kaita, R.; White, R.B.; Morris, A.W.; Fredrickson, E.D.; McGuire, K.M.; Medley, S.S.; Scott, S.D. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Jan 1988. Contract AC02-76CH03073. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009354/JAW.

Coherent magnetohydrodynamic modes have been observed during neutral beam injection in TFTR and JET. Periodic bursts of oscillations were detected with several plasma diagnostics, and Fokker-Planck calculations show that the populations of trapped particles in both tokamaks are sufficient to account for fishbone destabilization. Estimates of mode parameters are in reasonable agreement with the experiments, and they indicate that the fishbone mode may continve to affect the performance of intensely heated tokamaks. 13 refs., 1 fig., 1 tab.

38810 **(PPPL—2495) A dual far-infrared laser diagnostic of magnetized plasmas.** Darrow, D.S.; Park, H.K. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Feb 1988. Contract AC02-76CH03073. 19p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009355/JAW.

A dual far-infrared laser has been constructed and its properties have been exploited to probe tokamak-like discharges in the CDX toroidal device. Thermal variation of the difference frequency between the two far-infrared cavities is slow, though the cavities lack thermal stabilization, simply because their assembly on the same chassis exposes them to virtually identical temperature changes. The optical arrangement beyond the laser permits conversion within minutes between interferometry and density fluctuation observation, and within an hour between different operating wavelengths. Line-average densities of 2 {times} 10^{13} cm^{-3} and coherent fluctuations in the neighborhood of 20 kHz have been measured with this diagnostic. 15 refs., 5 figs., 2 tabs.

38811 **(PPPL—2497) q-dependent, H-mode-like phenomena in TFTR.** Budny, R.; Bell, M.; Bitter, M.; Bush, C.; Dylla, H.F.; Fredrickson, E.; Goldston, R.; Hendel, H.; Hill, K.; Hsuan, H.; Kilpatrick, S.; McCune, D.; McGuire, K.; Medley, S.S.; Morris, W.; Park, H.; Ramsey, A.; Scott, S.; Stratton, B.; Taylor, G.; Ulrickson, M.; Zarnstorff, M.C.; Zweben, S. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Feb 1988. Contract AC02-76CH03073. 22p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009357/JAW.

A new phenomenon has been observed in TFTR discharges with neutral beam injection and slowly ramped plasma current. When q/sub {psi/} (a) reaches certain values close to low-order rational numbers, the D/sub α/ emission decreases and the electron density profile broadens and increases, similar to observations during the H-mode in other tokamaks. This "q-mode" appears to have a neutral beam power threshold of {approximately} 6 MW. During co-injection, the plasma toroidal rotation decreases by {approximately} 50% at the transition. Very slowly toroidally rotating coherent adge modes, which slow and lock at the transition, were identified from the measured perturbations in {tilde B}/sub theta/} with mn {approximately} q/sub {psi/}(a). Calculations based on a tearing-mode model indicate that large islands, consistent with these measurements, could be present in the plasma edge and alter the plasma limiter interaction. At the transition Z/sub eff/ increases typically from 3 to 3.5. This increase and the electron density increase are caused largely by an increase in the carbon density. These increases raise the drag on fast ions, rapidly thermalizing some of the energy stored by beam ions, causing a transient rise in the plasma thermal energy. In addition, the global energy confinement time increases transiently. 26 refs., 7 figs., 1 tab.

38812 **(PPPL—2510) Time-dependent simulations of a Compact Ignition Tokamak.** Stotler, D.P.; Bateman, G. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1988. Contract AC02-76CH03073. 55p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011170/JAW.

Detailed simulations of the Compact Ignition Tokamak are carried out using a 1-1/2-D transport code. The calculations include time-varying densities, fields, and plasma shape. It is shown that ignition can be achieved in this device if somewhat better than L-mode energy confinement time scaling is possible. We also conclude that the performance of such a compact, short-pulse device can depend greatly on how the plasma is evolved to its flat-top parameters. Furthermore, in cases such as the ones discussed here, where there is not a great deal of ignition margin and the electron density is held constant, ignition ends if the helium ash is not removed. In general, control of the deuterium--tritium density is equivalent to burn control. 48 refs., 15 figs.

38813 **(PPPL—2512) Neutron spectroscopy on TFTR [Tokamak Fusion Test Reactor].** Nishitani, T.; Strachan, J.D. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1988. Contract AC02-76CH03073. 24p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011169/JAW.

This paper describes the use of an ^{3}He ionization chamber for neutron spectroscopy on TFTR during 1987. The ion temperature was measured using neutron spectroscopy for one set of ohmically heated plasmas. The deduced ion temperatures agreed to within 20% with those measured by other diagnostics. 11 refs., 11 figs., 1 tab.

38814 **(PPPL—2513) Nonlinear gyrokinetic equations for tokamak microturbulence.** Hahm, T.S. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1988. Contract AC02-76CH03073. 12p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011168/JAW.

A nonlinear electrostatic gyrokinetic Vlasov equation, as well as Poisson equation, has been derived in a form suitable for

particle simulation studies of tokamak microturbulence and associated anomalous transport. This work differs from the existing nonlinear gyrokinetic theories in toroidal geometry, since the present equations conserve energy while retaining the crucial linear and nonlinear polarization physics. In the derivation, the action-variational Lie perturbation method is utilized in order to preserve the Hamiltonian structure of the original Vlasov-Poisson system. Emphasis is placed on the dominant physics of the collective fluctuations in toroidal geometry, rather than on details of particle orbits. 13 refs.

38815 **(PPPL—2514) Orbit effects on impurity transport in a rotating tokamak plasma.** Wong, K.L.; Cheng, C.Z. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1988. Contract AC02-76CH03073. 40p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011167/JAW.

Particle orbits in a rotating tokamak plasma are calculated from the equation of motion in the frame that rotates with the plasma. It is found that heavy particles in a rotating plasma can drift away from magnetic surfaces significantly faster with a higher bounce frequency, resulting in a diffusion coefficient much larger than that for a stationary plasma. Particle orbits near the surface of a rotating tokamak are also analyzed. Orbit effects indicate that more impurities can penetrate into a plasma rotating with counter-beam injection. Particle simulation is carried out with realistic experimental parameters and the results are in qualitative agreement with some experimental observations in the Tokamak Fusion Test Reactor (TFTR). 19 refs., 15 figs.

38816 **(PPPL—2518) Soft x-ray camera for internal shape and current density measurements on a noncircular tokamak.** Fonck, R.J.; Jaehnig, K.P.; Powell, E.T.; Reusch, M.; Roney, P.; Simon, M.P. (Princeton Univ., NJ (USA). Plasma Physics Lab.). May 1988. Contract AC02-76CH03073. 15p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011872/JAW.

Soft x-ray measurements of the internal plasma flux surface shaped in principle allow a determination of the plasma current density distribution, and provide a necessary monitor of the degree of internal elongation of tokamak plasmas with a noncircular cross section. A two-dimensional, tangentially viewing, soft x-ray pinhole camera has been fabricated to provide internal shape measurements on the PBX-M tokamak. It consists of a scintillator at the focal plane of a foil-filtered pinhole camera, which is, in turn, fiber optically coupled to an intensified framing video camera ({DELTA}t {>=} 3 msec). Automated data acquisition is performed on a stand-alone image-processing system, and data archiving and retrieval takes place on an optical disk video recorder. The entire diagnostic is controlled via a PDP-11/73 microcomputer. The derivation of the polodial emission distribution from the measured image is done by fitting to model profiles. 10 refs., 4 figs.

38817 **(PPPL—2522) Neutral beam injection and plasma convection in a magnetic field.** Okuda, H.; Hiroe, S. (Princeton Univ., NJ (USA). Plasma Physics Lab.). Jun 1988. Contract AC02-76CH03073. 46p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011875/JAW.

Injection of a neutral beam into a plasma in a magnetic field has been studied by means of numerical plasma simulations. It is found that, in the absence of a rotational transform, the convection electric field arising from the polarization charges at the edges of the beam is dissipated by turbulent plasma convection, leading to anomalous plasma diffusion across the magnetic field. The convection electric field increases with the beam density and beam energy. In the presence of a rotational transform, polarization charges can be neutralized by the electron motion along the magnetic field. Even in the presence of a rotational transform, a steady-state convection electric field and, hence, anomalous plasma diffusion can develop when a neutral beam is constantly injected into a plasma. Theoretical investigations on the convection electric field are described for a plasma in the presence of rotational transform. 11 refs., 19 figs.

38818 **(TRITA-EPP—86-6) Current limitation and formation of plasma double layers in a non-uniform magnetic field.** Plamondon, R.; Teichmann, J.; Torven, S. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics and Fusion Research). Jul 1986. 30p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753031/JAW.

Formation of strong double layers has been observed experimentally in a magnetised plasma column maintained by a plasma source. The magnetic field is approximately axially homogenous except in a region at the anode where the electric current flows into a magnetic mirror. The double layer has a stationary position only in the region of non-uniform magnetic field or at the aperture separating the source and the plasma column. It is characterized by a negative differential resistance in the current-voltage characteristic of the device. The parameter space,where the double layer exists, has been studied as well as the corresponding potential profiles and fluctuation spectra. The electric current and the axial electric field are oppositely directed between the plasma source and a potential minimum which is formed in the region of inhomogeneous magnetic field. Electron reflection by the resulting potential barrier is found to be an important current limitation mechanism. (authors).

38819 **(TRITA-PFU—87-06) Plasma start-up, sustainment and stabilization by currents along a poloidal magnetic field.** Brunsell, P.; Tennfors, E. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics and Fusion Research). Apr 1987. 51p. NTIS (US Sales Only), PC A04/MF A01. Order Number DE88752507/JAW.

The stability and heating effects of induced low frequency poloidal currents in the internal ring device F IV A have been studied. Density fluctuations are stabilized already at low power poloidal currents. At higher levels the temperature is increased. The start-up process is more efficient and works at lower filling pressures than without poloidal currents, resulting in lower plasma density and higher temperature. Rotating plasmas with density of 1.5x10/sp21/ m/sp-3/ were obtained for a filling pressure of 6 mtorr. At the lowest filling pressures, 0.2 mtorr, a non-rotating plasma, sustained only by the poloidal current, with a density of 1.5x10/sp20/m/sp-3/ and a temperature of 7 eV was produced. At this low density, the plasma is permeable to neutral gas, as opposed to the impermeable plasmas in the earlier experiments with this device. The stabilizing effect seems to be related to the applied toroidal magnetic field rather than the induced poloidal current. (authors).

38820 **(UCLA/PPG—1147) Presheath profiles in simulated tokamak edge plasmas.** LaBombard, B.; Conn, R.W.; Hirooka, Y.; Lehmer, R.; Leung, W.K.; Nygren, R.E.; Ra, Y.; Tynan, G. (California Univ., Los Angeles (USA)). Apr 1988. Contract FG03-86ER52134. 23p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011709/JAW.

The PISCES plasma surface interaction facility at UCLA generates plasmas with characteristics similar to those found in the edge plasmas of tokamaks. Steady state magnetized plasmas produced by this device are used to study plasma-wall interaction phenomena which are relevant to tokamak devices. We report here progress on some detailed investigations of the presheath region that extends from a wall surface into these {open<-quotes}simulated tokamak{close<-quotes} edge plasma discharges along magnetic field lines.

38821 **(UCRL—98120) Radiative-hydro modeling and atomic data bases.** Nilsen, J. (Lawrence Livermore National Lab., CA (USA)). 26 Jan 1988. Contract W-7405-ENG-48. 8p. (CONF-870919—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011733/JAW.

From 6. topical conference on atomic processes in plasmas; Santa Fe, NM, USA (28 Sep 1987).

The methods by which we model high temperature plasmas will be described. The code XRASER is run on the Cray computers to simulate the kinetics, hydrodynamics, and radiation transfer in the high temperature plasma. Certain input is required by XRASER in the form of an atomic data file. The atomic data files are created using a variety of production atomic physics codes such as YODA. YODA will generate detailed energy levels, oscillator

strengths, photoionization cross sections, collisional excitation and ionization cross sections, and auger rates using relativistic multiconfiguration wavefunctions. This information is stored in an atomic data base. The code ADAM reads the atomic data from the data base and fills in the requested number of Rydberg energy levels based on a scaled hydrogenic approximation. ADAM adds the oscillator strengths, photoionization cross sections, and collisional excitation and ionization cross sections to connect the Rydberg levels with each other and also to connect the Rydberg levels with the detailed levels provided by YODA. The output of ADAM is in a format which XRASER understands. Using the atomic data file and a generator which specifies the plasma, XRASER is run to determine the time dependent properties of the plasma. 3 refs., 7 figs.

38822 **(UCRL—98278) Absolute calibration of a SPRED [Spectrometer Recording Extended Domain] EUV [extreme ultraviolet] spectrograph for use on the DIII-D tokamak.** Wood, R.D.; Allen, S.L. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 15p. (CONF-880364—29). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011317/JAW.

From 7. topical conference on high temperature plasma diagnostics; Napa, CA, USA (13 Mar 1988).

We have performed an absolute intensity calibration of a SPRED multichannel EUV spectrograph using synchrotron radiation from the NBS SURF-II electron storage ring. The calibration procedure and results for both a survey grating (450 g/mm) and a high-resolution (2100 g/mm) grating are presented. The spectrograph is currently in use on the DIII-D tokamak with a tangential line-of-sight at the plasma midplane. Data is first acquired and processed by a microcomputer; the absolute line intensities are then sent to the DIII-D database for comparison with data from other diagnostics. Representative data from DIII-D plasma operations will be presented. 6 refs., 3 figs., 1 tab.

38823 **Propagation of a relativistic electron beam along an array of conductors.** Rambo, P.W.; Denavit, J. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Applied Physics;* **64**: No. 2, 479-488(15 Jul 1988).

The propagation of a relativistic electron beam parallel to an array of parallel conductors, which provide charge and current neutralization of the beam, is investigated. Two geometries are studied: uniformly spaced planar foils or screens, and a matrix of parallel wires. The degree of charge and current neutralization and the resulting parallel and transverse fields are calculated for a uniform density pulse. The self-consistent transverse equilibrium is derived for the planar foil geometry. The effects of injection perpendicular to a planar cathode are investigated. Particle simulations in planar and cylindrical geometries are presented to confirm the analysis and to study edge effects and containment of the beam within the array. Comparison to vacuum drift tube operation shows that such arrays of conductors may allow beam transport with currents far exceeding the vacuum limit.

38824 **Relative ion expansion velocity in laser-produced plasmas.** Goldsmith, S.; Moreno, J.C.; Griem, H.R.; Cohen, L.; Richardson, M.C. (Laboratory for Plasma and Fusion Energy Studies, University of Maryland, College Park, Maryland 20742). *Journal of Applied Physics;* **64**: No. 2, 581-585(15 Jul 1988).

The spectra of highly ionized titanium, TiXIII through TiXXI, and CVI Lyman lines were excited in laser-produced plasmas. The plasma was produced by uniformly irradiating spherical glass microballoons coated with thin layers of titanium and parylene. The 24-beam Omega laser system produced short, 0.6 ns, and high intensity, 4 x 10^{14} W/cm,^{2} laser pulses at a wavelength of 351 nm. The measured wavelength for the 2p-3s TiXIII resonance lines had an average shift of +0.023 A relative to the CVI and TiXX spectral lines. No shift was found between the CVI, TiXIX, and TiXX lines. The shift is attributed to a Doppler effect, resulting from a difference of (2.6 +- 0.2) x 10^7 cm/s in the expansion velocities of TiXIX and TiXX ions compared to TiXIII ions.

38825 **Long-range cross-field ion-beam propagation in the diamagnetic regime.** Papadopoulos, K.; Mankofsky, A.; Drobot, A. (Science Applications International Corporation, McLean, Virginia 22102). *Physical Review Letters;* **61**: No. 1, 94-97(4 Jul 1988).

It is shown that high—kinetic-β neutralized ion beams with transverse width less than an ion gyroradius and density larger than the background plasma density can propagate uninhibited through a magnetized plasma over many ion gyroradii. The model is confirmed by computer simulations using a two-dimensional hybrid code.

38826 **Wave-breaking amplitude of relativistic oscillations in a thermal plasma.** Katsouleas, T.; Mori, W.B. (University of California, Los Angeles, Los Angeles, California 90024). *Physical Review Letters;* **61**: No. 1, 90-93(4 Jul 1988).

The maximum amplitude of relativistic plasma oscillations (v/sub ph/ near c) is obtained with a combined one-dimensional waterbag and warm-fluid model. The waterbag description is used to obtain expressions for the pressure and internal energy as functions of the proper density. A relativistic Euler's equation that is valid for arbitrarily large amplitudes and an analytic expression for the wave-breaking amplitude in the limit v/sub ph/=c are obtained. Even a small amount of thermal energy can significantly reduce the maximum plasma-wave amplitude relative to the cold wave-breaking value. The significance of the results for recent accelerator schemes is discussed.

38827 **Grazing incidence technique to obtain spatially resolved spectra from laser heated plasmas.** Behring, W.E.; Underwood, J.H.; Marshall, F.J.; Richardson, M.C.; Brown, C.M.; Feldman, U.; Seely, J.F. (NASA Goddard Space Flight Center, Laboratory for Astronomy & Solar Physics, Greenbelt, Maryland 20771). *Applied Optics;* **27**: No. 13, 2762-2767(1 Jul 1988).

An experimental method is described in which a grazing incidence spectrograph is used to obtain spatially resolved spectra of laser heated plasmas in the 6—370-A region. In the experiment, small target spheres were irradiated by tightly focused laser beams. A tilted grazing incidence elliptical mirror placed 1.3 m from the target focuses the plasma radiation on the spectrograph slit at a distance of 0.7 m producing a useful degree of spatial resolution in the recorded spectral lines. The spectrum from a copper target is presented together with an x-ray pinhole camera image of the plasma.

38828 **Simulation of oscillating field current drive on the reversed-field pinch.** Harned, D.S.; Schnack, D.D.; Strauss, H.R.; Nebel, R.A. (Science Applications International Corporation, San Diego, California 92121). *Physics of Fluids;* **31**: No. 7, 1979-1987(Jul 1988).

Oscillating field current drive on the reversed-field pinch is simulated by using a three-dimensional nonlinear resistive magnetohydrodynamic model in conjunction with a one-dimensional hyperresistive model. When input from the three-dimensional model is used for fluctuating fields in the hyper-resistive equations, the two models are found to give similar relaxed profiles. Comparisons are made with experiments on the Los Alamos National Laboratory ZT-40M reversed-field pinch device [Nucl. Fusion 25, 1321 (1985)]. Simulation results indicate that the oscillation period must be much less than the resistive decay time, but should not be much less than the hyper-resistive relaxation time, in order to maintain reversal without a steady-state driving field.

38829 **Compression of ultrahigh magnetic fields in a gas-puff Z pinch.** Felber, F.S.; Malley, M.M.; Wessel, F.J.; Matzen, M.K.; Palmer, M.A.; Spielman, R.B.; Liberman, M.A.; Velikovich, A.L. (JAYCOR, P. O. Box 85154, San Diego, California 92138). *Physics of Fluids;* **31**: No. 7, 2053-2056(Jul 1988).

Evidence is presented that an axial magnetic field of 100 kG has been compressed to 42 MG by an imploding neon gas-puff Z pinch on a 800 kJ, 7.5 MA, 60 nsec pulsed power generator. Machine electrical diagnostics and x-ray pinhole photographs indicate that this 420-fold field compression was produced by imploding plasma at high magnetic Reynolds number.

38830 Tomography and reliable information. Howard, J. (Plasma Research Laboratory, Research School of Physical Sciences, Australian National University, Canberra, A.C.T., Australia). *Journal of the Optical Society of America A: Optics and Image Science;* **5**: No. 7, 999-1014(Jul 1988).

Principles of tomography are developed and applied to the problem of two-view interferometry on a tokamak plasma. It is shown that M equispaced views, or projections, of a two-dimensional object yield precisely M^2+M numbers characterizing the object. This result is an extension of the previous work of Niland [J. Opt. Soc. Am. 72, 1677 (1982)], who proved that M^2 generalized Fourier coefficients, or moments of the object, could be retrieved by M-view tomography. Furthermore it is shown that only half of the alias-free numbers are useful in reconstructing a uniform image of the unknown object. Questions of sampling within a view are addressed and the aliasing contaminants explicitly identified. An algorithm using an orthogonal expansion in the frequency domain is used to examine the attributes of the image reconstructed using various subsets of the available Fourier coefficients.

38831 H/sub α/ studies on the Tokamak Fusion Test Reactor. Heifetz, D.H.; Ehrhardt, A.B.; Ramsey, A.T.; Dylla, H.F.; Budny, R.; McNeill, D.; Medley, S.; Ulrickson, M. (Princeton Plasma Physics Laboratory, Princeton, New Jersey 08544). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* **6**: No. 4, 2564-2567(Jul 1988).

H/sub α/ emission is a useful indicator of hydrogen ionization since the energy required to excite hydrogen to the n = 3 level is approximately the same as to ionize the hydrogen atom. Other aspects of recycling, such as plasma scrapeoff parameters, wall particle fluxes, and wall retention rates can be inferred from spatial distributions of H/sub α/ emission. There are two H/sub α/ diagnostics on the Tokamak Fusion Test Reactor (TFTR) observing the inner limiter: a relatively calibrated wide-angle television camera, and the absolutely calibrated H/sub α/ interference filter array (HAIFA) diagnostic, both viewing the inner limiter. H/sub α/ observations by these instruments have been analyzed using the d-smcapsEg-smcapsAS neutral transport code. The core recycling rate, and ion and neutral particle limiter fluxes, have been deduced from the calculations. The results are very sensitive to the ion flux distribution, and therefore also provide information on the plasma scrapeoff conditions. A survey was made of over 500 TFTR discharges. H/sub α/ emission appears to increase in proportion to n-bar^2/sub e/. The ratio of the core ionization to average H/sub α/ emission was calculated to be roughly constant over a large range of discharges.

38832 Nonlinear gyrokinetic theory for finite-beta plasmas. Hahm, T.S.; Lee, W.W.; Brizard, A. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **31**: No. 7, 1940-1948(Jul 1988).

A self-consistent and energy-conserving set of nonlinear gyrokinetic equations, consisting of the averaged Vlasov and Maxwell's equations for finite-beta plasmas, is derived. The method utilized in the present investigation is based on the Hamiltonian formalism and Lie transformation. The resulting formulation is valid for arbitrary values of k/sub perpendicular/rho/sub i/ and, therefore, is most suitable for studying linear and nonlinear evolution of microinstabilities in tokamak plasmas as well as other areas of plasma physics where the finite Larmor radius effects are important. Because the underlying Hamiltonian structure is preserved in the present formalism, these equations are directly applicable to numerical studies based on the existing gyrokinetic particle simulation techniques.

38833 Three-dimensional global numerical simulation of ion temperature gradient mode turbulence. Waltz, R.E. (General Atomics, San Diego, California 92138—5608). *Physics of Fluids;* **31**: No. 7, 1962-1967(Jul 1988).

Three-dimensional global numerical simulations of ion temperature gradient mode turbulence in a sheared and curved magnetic field corresponding to tokamak geometry is obtained. The key result demonstrates that there is no significant dependence of the bulk heat transport on the edge safety factor q in agreement with analytic theories. The motivation for this question in relation to tokamak experiments is discussed.

38834 Lyapunov stability analysis of magnetohydrodynamic plasma equilibria with axisymmetric toroidal flow. Almaguer, J.A.; Hameiri, E.; Herrera, J.; Holm, D.D. (Centro de Estudios Nucleares, Universidad Nacional Autonoma de Mexico, Mexico 20, D.F., Mexico). *Physics of Fluids;* **31**: No. 7, 1930-1939(Jul 1988).

Lyapunov stability conditions for ideal magnetohydrodynamic (MHD) plasmas with mass flow in axisymmetric toroidal geometry are determined in the Eulerian representation. Axisymmetric equilibrium solutions of ideal MHD are associated to critical points of a nonlinearly conserved Lyapunov functional consisting of the sum of the total energy and the following flux-weighted quantities: the circulation along field lines, the angular momentum, the toroidal flux, and the mass content within each flux tube. Conditions sufficient for Lyapunov stability of these equilibria against axisymmetric perturbations are found by taking advantage of the Hamiltonian formalism for ideal MHD. In particular [see Eq. (60)], it is sufficient for Lyapunov stability under linearized dynamics that an axisymmetric equilibrium be subsonic in the appropriate rotating frame, lie in the first elliptic regime of the Bernoulli—Grad—Shafranov (BGS) system of equations, and satisfy one additional, more complicated, condition. Effects of boundary conditions, nonlinearity, and three-dimensionality on MHD stability are also discussed.

38835 "Moderate-m" ballooning modes in quadrapole stabilized tandem mirrors. Nevins, W.M.; Pearlstein, L.D. (Lawrence Livermore National Laboratory, Livermore, California 94550). *Physics of Fluids;* **31**: No. 7, 1988-1998(Jul 1988).

The beta limits on the central cells of nonaxisymmetric tandem mirrors due to moderate-m ballooning modes are studied. Both finite Larmor radius (FLR) effects and corrections associated with the finite extent of the ballooning modes in the plane perpendicular to B are retained. The assumption of short perpendicular wavelength together with the large ellipticity of the flux surfaces near the magnetohydrodynamic (MHD) anchor cells allows a reduction of the three-dimensional problem into a sequence of three one-dimensional problems. The marginal stable boundary for the Mirror Fusion Test Facility (MFTF-B) (National Technical Information Service Document Nos. 82020108 and UCID-19359) is calculated and compared with that obtained from a low mode number calculation.

38836 Experimental studies of divertor stabilization in an axisymmetric tandem mirror. Casey, J.A.; Lane, B.G.; Irby, J.H.; Brau, K.L.; Golovato, S.N.; Guss, W.C.; Kesner, J.; Post, R.S.; Sevillano, E.; Zielinski, J.; and others. (Plasma Fusion Center, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139). *Physics of Fluids;* **31**: No. 7, 2009-2016(Jul 1988).

A divertor coil set has been installed on the Tara tandem mirror [Nucl. Fusion 22, 549 (1982); Plasma Physics and Controlled Nuclear Fusion Research 1984 (IAEA, Vienna, 1985), Vol. 2, p. 285] for stabilization of m = 1 flutelike modes. The effectiveness of divertor stabilization is discussed in experiments where m = 1 modes are driven to instability by plug electron cyclotron heating (ECH) in an ion cyclotron heated (ICH) plasma. The instability onset is characterized by thresholds in ECH power, fueling rate, ICH power, and mapping radius of the divertor null. In general, the stability is enhanced by mapping the null radially inwards into the plasma. The interdependence of these parameters and their effect on equilibrium profiles and stability boundaries are discussed.

38837 Excitation of ion Bernstein waves from loop antennas. Skiff, F.; Ono, M.; Wong, K.L. (Princeton Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08544). *Physics of Fluids;* **31**: No. 7, 2030-2036(Jul 1988).

Direct excitation and propagation of ion Bernstein waves from low-impedance current-carrying loop antennas in the ion cyclotron frequency range are studied over a range of plasma and antenna parameters. The dependence of wave coupling efficiency on plasma density and on wave frequency and parallel wavelength is obtained from measurements of wave amplitude and variations in antenna impedance. Comparisons are made to a simple nonuniform

warm-plasma model of the coupling problem. Generally good agreement is found between theory and experiment. As a result, some guidelines are proposed concerning antenna design.

38838 **Negative ion-acoustic solitons in a two-component magnetized plasma.** Song, L.T.; Lee, L.C.; Huang, L. (Department of Geophysics, Peking University, Beijing, People's Republic of China). *Physics of Fluids;* **31**: No. 6, 1549-1553(Jun 1988).

Ion-acoustic solitons in a two-component low-beta plasma are studied. It is found that under the quasineutrality condition only positive ion-acoustic solitons can exist in such a plasma. When the effect of charge separation is included, both positive and negative solitons can be found for C/sub s/ cos θ<V/sub p/<C/sub s/. Here θ is the angle between the wave vector and the magnetic field, C/sub s/ is the ion-acoustic velocity, and V/sub p/ is the phase speed. The amplitudes of the positive and negative solitons as a function of θ and V/sub p/C/sub s/ are also calculated.

38839 **Plasma oscillation bursts and scattering of intermediate energy alpha particles.** Coppi, B.; Porcelli, F. (Massachusetts Institute of Technology, 77 Massachusetts Avenue, Cambridge, MA (US)). *Fusion Technology;* **13**: No. 3, 447-452(Mar 1988).

The possibility that plasma oscillation bursts ("fishbones") could be excited in a fusion burning plasma is pointed out. The relevant instability is brought about by the resonant interaction between an m/sup 0/ = 1 mode and slowed down alpha particles in the 300- to 400-keV energy range. The resulting resonant scattering of these intermediate energy particles does not appear to affect significantly the alpha-particle heating power. The drift of the banana orbits of 3.5-MeV alpha particle in the fluctuating field associated with this instability and the possible secondary instabilities driven by the locally depleted alpha-particle distribution function may have more serious consequences.

38840 **Modification of Tokamak ballooning stability boundaries by alpha populations.** Spong, D.A.; Sigmar, D.J.; Ramos, J.J. (Oak Ridge National Lab., Oak Ridge, TN (US)). *Fusion Technology;* **13**: No. 3, 428-431(Mar 1988).

For T/sub α//T/sub i/ < 150 (where T/sub α/ is the alpha-mean energy and T/sub i/ the ion temperature), the trapped alpha precision resonance destabilizes the kinetic ballooning mode of the bulk plasma. Using a slowing down distribution and both circular and noncircular equilibrium models, the eigenfrequencies of the resonant ballooning integral equation are computed. One finds lower critical betas and a widening of the unstable region particularly at higher electron temperature and for flat q, steep pressure profiles typical of ignited sawtoothing plasmas.

38841 **On reflection from a suddenly created plasma half-space: Transient solution.** Kalluri, D.K. (Dept. of Electrical Engineering, Univ. of Lowell, Lowell, MA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science;* **16**: No. 1, 11-16(Feb 1988).

The reflection by a suddenly created plasma half-space of a time-harmonic plane electromagnetic wave propagating in free space is considered. The problem involves a temporal discontinuity, a spatial discontinuity, and a dispersive medium. The steady-state solution is obtained by considering the basic features of the scattering processes due to each of the discontinuities in terms of analogous transmission-line models. The electric field of the reflected wave consists of two components. One component (called component A) is of the same frequency as the incident wave frequency and is due to the spatial discontinuity. The other component (called component B) is of a different frequency and arises because of the temporal discontinuity. The B components is damped out even if the plasma is only slightly lossy. The damping rate of the B component is calculated. The transient solution is obtained through the use of Laplace transforms. The solution is given in terms of Bessel-like functions. The limiting value of this solution is shown to agree with the steady-state solution. Numerical results illustrating the transient effects are given for two typical cases.

38842 **Scrapeoff layer studies with an instrumented limiter.** Mioduszewski, P.K.; Edmonds, P.H.; Emerson, L.C.; Simpkins, J.E. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC05-84OR21400.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

An instrumented limiter was used as a diagnostic to measure energy deposition and power fluxes in the scrapeoff layer. The limiter consisted of an array of 12 tiles, each equipped with a thermocouple. This arrangement represented a calorimeter array that yielded the total limiter energy and decay length of the power flux in the scrapeoff layer. Energy deposition and decay lengths are discussed for various plasma parameters.

38843 **Asymmetries in the density at the edge of a tokamak plasma.** Watkins, J.G.; Yokoyama, K.E.; Wootton, A.J. (Sandia National Labs., Albuquerque, NM (USA); Tennessee Univ., Knoxville (USA); Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789;AC05-84OR21400.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Several Langmuir probes were used simultaneously to observe density asymmetries at the edge of the beam-heated tokamak ISX-B. The large number of identical discharges required for the joint JET/ISX-B beryllium limiter experiment offered the opportunity to perform a careful edge study of the scrape-off layer using probes at various poloidal, toroidal, and radial locations. Floating, double, Langmuir probes were used at 3 separate locations. Edge density asymmetries were observed and correlated with the local connection length along a field line between material surfaces in the scrape-off layer. The effects of limiter movement were also explored with limiters other than the main limiter. It was observed that the asymmetries were altered somewhat when either the magnetic field or the plasma current was reversed. These spatial variations were accentuated locally when a certain critical density was exceeded and may be due to enhanced recycling at the main limiter just below the disruption-limited maximum density.

38844 **Effects of ICRH on the edge plasma in TMX-U tandem mirror.** Hsu, W.L.; Causey, R.A.; Wilson, K.L.; Cummins, W.F.; Molvik, A.W. (Sandia National Labs., Livermore, CA (USA); Lawrence Livermore National Lab., CA (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

A Langmuir probe was used to study the effects of ICRH on edge plasmas in TMX-U. Two types of antenna configurations were used for plasma heating, the slot and the loop. During slot antenna operation, the electron temperature near the limiter cutoff radius increased from 30 to 70 eV with 180 kW of transmitted power at slot frequencies ranging from 0.65 < $\omega\omega$/sub ci/ $\leqq$ 1.00. In contrast, the loop antenna showed little heating of edge electrons. The observed edge heating occured without necessarily a concurrent heating of the core electrons. The predicted result based on McVey ANTENA code was also in good qualitative agreement with the observed edge heating. These analyses suggest that Landau and collisional damping of the T-M surface plasma wave was the main mechanism for edge heating. Results on edge density behavior during ICRH are also presented.

38845 **Global particle recycling with ohmic and neutral beam heating in TFTR.** Shimada, M.; Ramsey, A.T.; Owens, D.K.; Dylla, H.F.; Budny, R.V.; Lomarche, P.H.; Schivell, J.F.; Heifetz, D.; Groebner, R.J.; Murakami, M. (Princeton Univ., NJ (USA). Plasma Physics Lab.; GA Technologies, Inc., San Diego, CA (USA); Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC02-76CH03073.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

High I/sub p/, high n/sub e/ TFTR discharges exhibit a strong density increase throughout most of the period of 0.5 s neutral beam pulses. This increase is consistent with beam fueling. On the other hand, low I/sub p/, low n/sub e/ discharges show n/sub e/ saturation shortly after the beam turn-on. The latter phenomenon has been observed in smaller devices operated at lower I/sub p/ ('density-clamping'). The H/sub α/ emission near the limiter shows a strong density and plasma current scaling [(anti n/sub e/I/sub p/)^2] but shows little change with beam power toroidal field, and plasma species, or with a change in wall condition (with and without Cr gettering and ZrAl gettering).

38846 **Particle flux measurements with pump limiters.** Mioduszewski, P. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials*; **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC05-84OR21400.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The pressure buildup in pump limiters is a function of the incident particle flux, the pump limiter geometry, particle-surface interactions, and effects due to interactions of the neutral gas with the incoming plasma. At sufficiently low density and for a short pump limiter throat, the pressure observed in the pump limiter chamber is a direct measure of the particle flux at the limiter slot. This paper discusses a simple model for the correlation between particle flux and pump limiter pressure in ISX-B. In addition, some estimates are presented on the thermalization of fast neutrals in the pump limiter duct and its implications for 'enhanced particle collection'.

38847 **Maximum entropy method of spectral estimation as a fluctuation diagnostic.** Levinson, S.J.; Koh, T.; Kim, S.B.; Powers, E.J. (Dept. of Electrical and Computer Engineering, Univ. of Texas at Austin (US)). pp 37 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—).

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

In this paper, the authors compare the relative advantages and limitations of the maximum entropy methods (MEM) of spectral estimation with the more conventional fast Fourier transform (FFT) approach. Specifically, they discuss the ability of the MEM method to estimate, with increased frequency resolution and smaller variance, fluctuation-induced particle transport for relatively short duration data records. A simulation of plasma potential and density fluctuation data is first performed in order to quantitatively compare MEM and conventional FFT spectral estimates with known results. Next, they compare MEM and FFT techniques for three different data sets. The three data sets and the results are described in this paper.

38848 **Plasma energy balance model for optical-laser-induced impulse in vacuo.** Dingus, R.S.; Goldman, S.R. pp 111-122 of Lasers '86; Proceedings of the Ninth International Conference on Lasers and Applications, Orlando, FL, Nov. 3-7, 1986. Mcmillan, R.W. Atlanta, GA; Georgia Institute of Technology (1987). (CONF-861177—).

From 9. international conference on lasers and applications; Orlando, FL, USA (3 Nov 1986).

A simple plasma energy-balance model, along with its derivation, is presented for calculating the impulse from targets in a vacuum exposed to single-pulse optical lasers. Results from the model agree well with experimental data and LASNEX radiation-hydrodynamic computer code calculations. The model assumes isothermal blowoff and thus takes advantage of the insensitivity of impulse to energy distribution within the ablated mass. The success of the model indicates that the impulse is insensitive to detailed interactions in the vicinity of the ablation surface. 10 references.

38849 **ICRF enhanced potentials.** Nelson, B.A. Madison, WI; Univ. of Wisconsin (1987). 309p. University Microfilms Order No. 87-16,532.

Thesis (Ph. D.).

Ion-confining potentials in the Phaedrus tandem mirror are shown to be enhanced over Boltzmann-relations predicted values by radio-frequency (rf) waves in the ion cyclotron range of frequencies (ICRF). The ICRF enhanced potential is larger in the end cell with a lower passing density. Peak potential values decrease with increasing ion endloss current (or central cell density) for a constant rf capacitor bank voltage, and increase with increasing rf-capacitor bank voltage, for a constant ion endloss value (or central cell density). In fully axisymmetric operation, a potential peak is produced in an end cell by the central-cell rf, (with-out end-cell rf) and is found only in the end cell nearer the central-cell antenna. ICRF enhanced potentials are explained as an equilibrium between the electron-collisional filling-in rate and the electron pumping out rate provided by axial time-varying electric fields. Thermal barrier-like potential structures were found in the transition regions between the central cell and end cells, in the fully axisymmetric Phaedrus. Central-cell ICRF trapping effects combined with end-cell $\mu\Delta$ B forces create and pump the barrier potential wells.

38850 **Alpha loss-cone instability in the central cell of a tandem-mirror reactor.** Ho, S.K. Urbana-Champaign, IL; Univ. of Illinois (1987). 225p. University Microfilms Order No. 87-21,658.

Thesis (Ph. D.).

D-T fusion-born alpha particles are mirror-confined in the central cell of a tandem-mirror reactor. The resulting anisotropic loss-cone distribution of the alpha particles in velocity space is capable of destabilizing low-frequency plasma waves, thus affecting the energy balance in a tandem mirror plasma. The low-frequency waves of a cold, cylindrical, sharp-boundary, D-T plasma are studied. Techniques were developed to trace the wave-propagation regions and search the wave eigenfrequencies. Three branches of waves are found, namely the Alfven, hybrid, and fast waves; but only the Alfven wave is destabilized by the alpha loss-cone instability. The modeling of the alpha distribution function for the linear and quasi-linear instability calculations is done by a diffusion-front method and a numerical finite-difference method, respectively. The growth rate of the instability is basically determined by the alpha number density, the loss-cone angle, and the polarization of the wave. These quantities are in turn mainly affected by the density and temperature of the plasma ions and electrons, the mirror ratio, and the plasma radius. A stability boundary in the n-T plane is constructed to locate the stable and unstable regions. The instability is found to occur with moderate values of plasma density and temperatures.

38851 **Experimental studies of the rotational stability of the Phaedrus Tandem Mirror.** Severn, G.D. Madison, WI; Univ. of Wisconsin (1987). 185p. University Microfilms Order No. 87-20,484.

Thesis (Ph. D.).

It is demonstrated that the radial electric field in the Phaedrus Tandem Mirror can be altered using Plasma Potential Control rings (PPC rings) situated at each end of the device, and the azimuthal plasma rotational velocity may thus be varied. A simple calculation to model the change in central-cell potential due to a bias voltage applied to the PPC rings is presented. Low-frequency ($w << w/sub ci/$), low azimuthal mode number ($m = -1$ and $m = -2$) instabilities drive by E x B rotation were observed. The radial potential profile was experimentally variable using the same method for the case that Phaedrus was operated as an axisymmetric tandem mirror with MHD stability provided by the RF ponderomotive force. Instabilities having azimuthal $m = -1$, -2, and -3 ($W << w/sub ci/$), were observed to occur as E x B was increased. The destabilizing centrifugal force due to E x B rotation was compared to the destabilizing curvature force and RF ponderomotive force and found to account for the observed instabilities.

38852 **Quasi-linear saturation of the drift-cyclotron loss-cone mode.** McCarrick, M.J. College Park, MD; Univ. of Maryland (1987). 164p. University Microfilms Order No. 87-25,418.

Thesis (Ph. D.).

The drift-cyclotron loss-cone instability (DCLC) is observed to grow to large amplitudes and subsequently saturate through non-

linear processes in MIX-1, a small magnetic mirror machine. The amplitude at which the mode saturates is a sensitive function of the ion energy distribution function, and of the mirror ratio (B/sub max/B/sub min/) of the device. Direct experimental measurements are made of the wave properties including growth time, saturation amplitude, real frequency, and wave number. Simultaneous measurements determine the ion energy distribution as a function of time. The experimentally measured saturated state is compared to the predictions of a quasi-linear diffusion theory. The quasi-linear calculation predicts that the unstable wave will grow to a sufficient level so as to turbulently scatter trapped ions into the loss-cone region, thereby forcing the mode to marginal stability. This source of loss-cone ions balances the concomitant loss rate of unconfined ions, determining the self-consistent saturation amplitude.

38853 **Experimental studies of plasma heating due to the parametric decay of alarge-amplitude pump into lower-hybrid waves.** Harper-Slaboszewicz, V.J. Davis, CA; Univ. of California (1987). 132p. University Microfilms Order No. 87-23,395.

Thesis (Ph. D.).

Plasma heating of a high-density low-temperature linear plasma by the parametric decay instability of lower-hybrid waves excited in a parallel-plate geometry is studied experimentally for ww/sub lh/ = 3 and 10. The electric-field distribution is modeled considering the higher-order modes produced in this geometry. A method of measuring bulk electron temperature in the presence of an oscillating potential is developed and validated. Electron-heating results show that the parametric decay instability in this geometry is strongly driven and strongly convectively damped, resulting in very rapid electron heating that saturates in a time of 20-30w^{-1}. Bulk electron heating consistent with a recent theory of parametric decay of a large-amplitude driver near the lower-hybrid frequency is also observed. Control of the instability by use of a finite-bandwidth driver is also studied, and results show that the threshold of the parametric decay instability in this geometry can be increased by a factor of 3 by a noise-modulated driver with Δww - .7. These results are contrasted with earlier studies.

38854 **Waves and instabilities in plasmas.** Chen, L. Teaneck, NJ; World Scientific Pub. Co. (1987). 250p. World Scientific Pub. Co., 687 Hartwell Street, Teaneck, NJ 07666.

The contents of this book are: Plasma as a Dielectric Medium; Nyquist Technique; Absolute and Convective Instabilities; Landau Damping and Phase Mixing; Particle Trapping and Breakdown of Linear Theory; Solution of Viasov Equation via Guilding-Center Transformation; Kinetic Theory of Magnetohydrodynamic Waves; Geometric Optics; Wave-Kinetic Equation; Cutoff and Resonance; Resonant Absorption; Mode Conversion; Gyrokinetic Equation; Drift Waves; Quasi-Linear Theory; Ponderomotive Force; Parametric Instabilities; Problem Sets for Homework, Midterm and Final Examinations.

38855 **Investigations of stimulated Raman scattering from high-density underdense plasmas irradiated by a 0.35-micron laser.** Figueroa Lopez, H.G.T. Los Angeles, CA; Univ. of California (1986). 145p. University Microfilms Order No. 87-23,164.

Thesis (Ph. D.).

Studies of stimulated Raman back and forward scattering and the generation of high-energy electrons at 0.35 microns are presented. To isolate the various phenomena occurring at different densities, attempts were made to control the plasma density by varying the thickness of the foil targets and also by using foam targets of variable average density. The frequency of the scattered light is used as a diagnostic to measure the plasma density. Time-resolved and time-integrated spectra for various plasma densities are discussed. Also, the measured energy and angular distribution of the high-energy electrons from foil targets are presented. Two-plasmon decay is suggested as the probable mechanism generating the hot electrons.

38856 **Pump-limiter experiments and analysis in the TEXTOR tokamak.** Campbell, G.A. Los Angeles, CA; Univ. of California (1986). 173p. University Microfilms Order No. 87-23,160.

Thesis (Ph. D.).

The ALT-1 pump limiter was used effectively for particle control in the TEXTOR tokamak. Two distinctively different pump-limiter modules gave markedly different performance. Operation both as the main limiter and in the shadow of the main TEXTOR limiters allowed evaluation of the pump limiter over a wide range of incident plasma parameters. Incident ion fluxes of up to 9.5 X 10^{18} $cm^{+2}s^{-1}$ are measured with Langmuir probes mounted on ALT-1. Pressures of up to 3 mtorr are measured in the large (700 l) ALT-1 vacuum chamber with no active pumping. With active pumping (7000 l/s) particle-removal rates of up to 7 torrl/s are measured. The pressure rise in the pump limiter is strongly dependent on the interaction of neutrals with the edge plasma. The experimental results are found to agree closely with a 3-D Monte-Carlo neutral-transport code that includes the atomic physics of the plasma-neutral interaction. Langmuir probes mounted directly on the ALT limiter, and a scanning probe located 90° toroidally from the limiter are used to characterize the edge plasma.

38857 **Helically linked mirror arrangement.** Ranjan, P. Berkeley, CA; Univ. of California (1986). 115p. University Microfilms Order No. 87-18,131.

Thesis (Ph. D.).

A scheme of helical linking of mirror sections is described, which endeavors to combine the better features of toroidal and mirror devices by eliminating the longitudinal loss of mirror machines, that have moderately high average β and steady-state operation. The scheme is aimed at a device, with closed magnetic surfaces having rotational transform for equilibrium, one or more axisymmetric straight sections for reduced radial loss, a simple geometrical axis for the links, and an overall positive magnetic well depth for stability. A description of the helically linked mirror scheme is given. This example has three identical straight sections connected by three sections having helical geometric axes. A theoretical analysis of the magnetic field and single-particle orbits in them leads to the conclusion that most of the passing particles would be confined in the device and they would have orbits independent of pitch angle under certain conditions. Numerical results presented agree well with theoretical results as far as passing particle orbits are concerned. Some consideration of the stability of linked mirrors is presented.

38858 **(ANL/FPP/TM—220) Erosion/redeposition modeling and calculations for carbon.** Brooks, J.N.; Brice, D.K.; Dewald, A.B.; McGrath, R.T. (Argonne National Lab., IL (USA); Sandia National Labs., Albuquerque, NM (USA); Georgia Inst. of Tech., Atlanta (USA)). Apr 1988. Contract W-31109-ENG-38;AC04-76DP00789. 21p. (SAND—87-2868C; CONF-880512—5). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010382/JAW.

From 8. international conference on plasma surface interactions in controlled fusion devices; Julich, F.R. Germany (2 May 1988).

Several key aspects of carbon erosion/redeposition in fusion devices have been examined. These include the effects of an oblique magnetic field geometry plasma sheath on ion impingement and sputtering, and the effect of surface hydrogen buildup on sputtering. The calculations use a version of the MEASTRI hydrogen implantation code and a cloud-in-cell type sheath code. Time dependent erosion calculations have been made for the TFTR bumper limiter, using the REDEP erosion/redeposition code with updated sheath and sputtering modes. The computed plasma carbon content during a TFTR limiter "deconditioning" run and for a "supershot" beam heating case is similar to measured values. The calculations predict that depletion of the near surface graphite hydrogen concentration enhances the self and hydrogen sputtering coefficients. This mechanism provides an explanation for the larger Z-effective values observed on TFTR immediately after limiter conditioning. 21 refs., 6 figs.

38859 (CEA-CONF—9203) Comparison between positive ion with electrostatic recovery and negative ion based neutral system. Jacquot, C. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). Jul 1987. 8p. (CONF-870787—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88752558/JAW.

From International Atomic Energy Agency technical committee meeting on negative ion beam sources; Culham, UK (15 Jul 1987).

To achieve the efficiency and cost goals required for plasma heating and non-inductive current drive, two neutral beam system solutions can be envisaged and choice between them depends strongly of the neutral energy. The first one is the positive ion with electrostatic recovery based neutral system and the other is the negative ion based neutral system. In this paper a comparison of the two systems is presented in order to inject 50 MV of D/sub o/ in steady state with a total efficiency around 0.5.

38860 (CEA-CONF—9207) Tore-Supra: a Tokamak with superconducting toroidal field coils. Turck, B. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). Jul 1987. 23p. (CONF-870790—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752560/JAW.

From 1. European workshop on high T/sub c/ superconductors and potential applications; Genova, Italy (1 Jul 1987).

Tore Supra is a tokamak under construction on the site of Cen Cadarache by the Euratom-CEA Association. The machine technology integrates all problems related to the fabrication and the operation of large superconducting coils and of the associated cryogenic system. Tore Supra will provide a significant experience to prepare the next generation of machines for plasma physics and controlled fusion. Tore Supra is specially designed to implement a large physics program. The superconducting coils make possible the study of plasma confinement in long pulses (more than 60s), the impurities and the stability, and the efficiency of additional heating sources (neutral particle beams and radio frequency heating). The opportunity is taken to recall the particular features and requirements of the superconducting coils of the large future tokamaks in order to point out the problems that have to be faced by any new material (superconducting or not).

38861 (CEA-CONF—9300) Non linear self consistency of microtearing modes. Garbet, X.; Mourgues, F.; Samain, A. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. de Recherches sur la Fusion Controlee). 1987. 14p. (CONF-8708235—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753471/JAW.

From International school of plasma physics; Varenna, Italy (24 Aug 1987).

The self consistency of a microtearing turbulence is studied in non linear regimes where the ergodicity of the flux lines determines the electron response. The current which sustains the magnetic perturbation via the Ampere law results from the combined action of the radial electric field in the frame where the island chains are static and of the thermal electron diamagnetism. Numerical calculations show that at usual values of β/sub pol/ in Tokamaks the turbulence can create a diffusion coefficient of order ν/sub th/ρ^2/sub i/ where ρ/sub i/ is the ion larmor radius and ν/sub th/ the electron ion collision frequency. On the other hand, collisionless regimes involving special profiles of each mode near the resonant surface seem possible.

38862 (CLM-R—278) Study of the reactor relevance of the NET design concept. Reynolds, P.; Worraker, W.J. (comps.). (UKAEA Culham Lab., Abingdon). Aug 1987. 403p. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

The objective of the study was to explore the reactor relevance of NET, i.e. whether the technologies and design principles proposed for NET can be directly extrapolated to a demonstration power reactor (DEMO). The main areas of study were those near to the plasma, namely the divertor, first wall and tritium breeding blanket. Other aspects which were investigated were tritium permeation and recovery, reactor maintenance, afterheat and effects of disruptions. The principal results of the study are briefly presented; the details of the work are given in fourteen appendices. These appendices were selected for INIS and indexed separately. The overall conclusion of the study is that the NET design is only partly relevant to the design requirements of a DEMO reactor. (U.K.).

38863 (CLM-R—278, pp A1-1-A1-5) On the definition of a DEMO (demonstration) reactor. Appendix 1. Cole, H.C.; Challender, R.S. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The paper is an appendix to a study of the reactor relevance of the NET design concept. The latter study examines whether the technologies and design principles proposed for NET can be directly extrapolated to a demonstration (DEMO) reactor. The authors have suggested a definition of a DEMO, and listed what they considered to be the most important implications of this definition. A table of parameters is included comparing published DEMO's with typical commercial reactor and 'pre-DEMO' studies. (U.K.).

38864 (CLM-R—278, pp A2-1-A2-15) Parameter set for a double-null DEMO reactor. Appendix 2. Cooke, P.I.H. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The present study is aimed at commenting on the reactor-relevance of the design principles and technology being proposed for NET. The authors propose that a double-null device serve as a basis for a NET-based demonstration reactor. Calculations are carried out to determine the parameter set for reactors based on the double-null NET design, and the results are presented in tabular form. (U.K.).

38865 (CLM-R—278, pp A3-1-A3-21) Poloidal field calculations for a double-null DEMO reactor. Appendix 3. Cooke, P.I.H. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

This note describes calculations performed on the poloidal field (PF) coil system for the double-null divertor DEMO reactor, which is the focus of our current study. The design of the PF coil system is very sensitive to the details of the plasma configuration and the operating scenario and represents an important area in commenting on the reactor-relevance of the NET design. The PF coils for NET DN and the proposed operating scenario have, therefore, been adapted to the different parameters for DEMO and coil currents, voltages and powers have been determined. Calculations of the effect of the vacuum vessel during start-up and of the out-of-plane forces on the toroidal field coils are also briefly described.

38866 (CLM-R—278, pp A4-1-A4-68) Divertor. Appendix 4. Harrison, M.F.A.; Hotston, E.S.; Thompson, V.K.; Worraker, W.J. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The paper on divertors is an appendix to a study of the reactor relevance of the NET design concept. The latter study examines whether the technologies and design principles proposed for NET can be directly extrapolated to a demonstration (DEMO) reactor. The present paper examines the likely impact upon divertor performance of the relatively large fusion power of a DEMO reactor. Divertor cooling is investigated with respect to scaling of the divertor cooling system between NET and DEMO, and divertor thermohydraulics. Finally, the mechanical design of divertors is discussed, including: the selection of DEMO target design, overall

layout and magnetic geometry, liquid metal sputtering protection, stress calculations, and lifetime estimates. (U.K.).

38867 (CLM-R—278, pp A5-1-A5-40) **Relevance of NET first wall concept for DEMO DN. Appendix 5.** Kiltie, J.S. (Rolls-Royce Ltd., Derby (UK)). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

Design studies for the Next European Torus (NET) have produced a design concept for the first wall. This concept features poloidal water cooling, double contained in a welded steel structure which is protected by radiatively cooled tiles. In this appendix the relevance of this concept to a DEMO is examined with particular emphasis given to the ability of the cooling tube arrangement to remove the heat. A suggested modification to the arrangement of coolant tubes is suggested so that the design can operate at the higher loadings of a DEMO.

38868 (CLM-R—278, pp A6-1-A6-40) **Water-cooled lithium-lead blanket. Appendix 6.** Baker, L.J.; Needham, J.; Challender, R.S.; Coast, G.; Heath, E.C. (UKAEA Harwell Lab. Materials Physics and Metallurgy Div.; Progressive Engineering Consultants Ltd., Warrington (GB); UKAEA Risley Nuclear Power Development Establishment). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The paper is an appendix to a study of the reactor relevance of the NET design concept. The present study examines whether the water-cooled lithium-lead blanket designed for NET can be directly extrapolated to a demonstration (DEMO) reactor. A fundamental requirement of the exercise is that the DEMO design should have a tritium breeding ratio which is higher than that in NET. The water-cooled lithium-lead blanket is discussed with respect to: neutronics design, design parameter survey and thermohydraulics, and engineering design. Results are reported of three-dimensional calculations using the Monte Carlo code MORSE-H to investigate possible neutron leakage between the poloidally disposed breeder tubes, and to determine the global tritium breeding ratio for the final double null machine design. (U.K.).

38869 (CLM-R—278, pp A7-1-A7-24) **Water-lead-lithium reactions. Appendix 7.** Currie, R. (UKAEA Dounreay Nuclear Power Development Establishment). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The options of a water cooled, lead lithium eutectic breeder blanket is being considered for NET (Next European Torus). The favoured designs feature a single wall barrier between the water and the lithium-lead, therefore the possibility of breaches of this barrier with resultant chemical interactions must be considered. The purpose of this Appendix is to indicate the possible problems in the fusion reactor breeder blanket, based on the UK fast reactor experience, and to suggest further work which would allow codes, being developed to aid fast reactor designers to achieve safe and economically viable sodium heated steam generators, to be used to aid the design of the fusion blanket.

38870 (CLM-R—278, pp A8-1-A8-21) **Helium-cooled lithium-lead blanket. Appendix 8.** Baker, L.J.; Needham, J.; Challender, R.S.; Coast, G.; Hopkins, M.; Lavender, K.E. (UKAEA Harwell Lab. Materials Physics and Metallurgy Div.; Progressive Engineering Consultants Ltd., Warrington (GB); UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

In this paper the development of the Next European Torus (NET-DN) outboard liquid lithium-lead breeding blanket design to the size and performance required for a demonstration tokamak reactor (DEMO) is described. The purpose of this exercise is to show that the NET design represents a logical step in the development of a tokamak fusion power reactor; thus it was considered essential to retain both the basic geometric layout of the NET blanket and the means of access and maintenance through a nearly vertical port. However the detailed requirements of the NET and DEMO machines differ. For NET it is necessary to demonstrate in principle that tritium breeding and power generation are possible, whereas for DEMO the tritium breeding ratio (TBR) and power generation efficiency must demonstrate commercial viability.

38871 (CLM-R—278, pp A9-1-A9-39) **Tritium permeation and recovery. Appendix 9.** Bond, R.A.; Hamilton, A.M. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The paper is an appendix to a study of the reactor relevance of the NET design concept. The latter study examines whether the technologies and design principles proposed for NET can be directly extrapolated to a demonstration (DEMO) reactor. In this appendix, tritium transport in the DEMO breeding blanket is considered with emphasis on the permeation rate from the lithium-lead breeder into the coolant. A computational model used to calculate the tritium transport in the breeder blanket is described. Results are reported for the tritium transport in the NET/INTOR type blanket as well as the DEMO blanket in order to provide a comparison. In addition, results are presented for the helium coolant tritium extraction analysis. (U.K.).

38872 (CLM-R—278, pp A10-1-A10-17) **Afterheat evaluation and thermal transient analysis for the water-cooled lithium-lead first wall and blanket of the DEMO version of NET. Appendix 10.** Giancarli, L.; Thompson, V.K. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

In the present paper, the afterheat problem is addressed for the case of the DEMO version of the water-cooled lithium-lead blanket proposed for NET. The study is divided into two major steps: the nuclear analysis, that leads to the evaluation of the amount of heat deposited in each component for various given cooling times, and the thermal transient analysis that leads to the consequent determination of the spatial and temporal variation of the temperature in the different components, depending on which accident or maintenance scenario is analysed.

38873 (CLM-R—278, pp A11-1-A11-5) **Survey of the availability of beryllium, lithium, lead and helium in the context of fusion reactor blanket design. Appendix 11.** Bond, A. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The paper is an appendix to a study of the reactor relevance of the NET design concept. The appendix reviews the availability of four scarce materials, namely beryllium, lithium, lead and helium, which appear to be essential to a demonstration fusion reactor blanket based on NET design studies. For each reactor, the quantity of beryllium required is 120 tonnes, lithium is 11 tonnes and lead is 1530 tonnes. The paper concludes that there is no resource problem for these elements within the near term availability (25 years). (U.K.).

38874 (CLM-R—278, pp A12-1-A12-68) **Effect of plasma disruptions on the structural integrity of the DEMO first wall modules. Appendix 12.** Bond, R.A.; Thompson, V.K. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

In this paper a preliminary analysis of the stress distribution induced during a plasma disruption on the first wall modules of the DEMO reactor is presented. The main emphasis in the analysis is on the understanding of the induced current distributions and their interaction with external magnetic fields. In this respect various module models were constructed, some including the vacuum vessel, in order to ascertain the effect of various design choices on the induced electromagnetic forces. The computer code used to perform the analysis is briefly described followed by a description of the various models used to represent the first wall modules. The main results on the forces and stress distributions are presented.

38875 (CLM-R—278, pp A13-1-A13-18) **Handling and maintenance procedure for replaceable parts, (blanket modules and divertors) of DEMO-DN. Appendix 13.** Gaffka, R.C.; Hopkins, M.; Lavender, K.E.; McCarthy, C.E.A. (UKAEA Culham Lab., Abingdon). Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The task of examining the reactor relevance of the NET-DN design must include a handling and maintenance procedure for parts which require replacement since high machine availability is an important requirement for a commercial reactor. This paper considers one certain requirement for the handling and maintenance of a DEMO-DN reactor and lists the constraints imposed by following the NET-DN design. A support and handling system for the replaceable parts (blanket modules and divertors) is described and an estimate is given for the maintenance down-time.

38876 (CLM-R—278, pp A14-1-A14-6) **Parameters of DEMO DN and JET DN. Appendix 14.** Aug 1987. NTIS (US Sales Only), PC A18/MF A01. Order Number DE88753508/JAW.

In Study of the reactor relevance of the NET design concept.

The paper is an appendix to a study of the reactor relevance of the NET design concept. The latter study examines whether the technologies and design principles proposed for NET can be directly extrapolated to a demonstration (DEMO) reactor. The appendix presents the parameters of the DEMO and NET under the topic headings: power, geometry, plasma, toroidal and poloidal magnetic field coils, first wall engineering, divertor physics, divertor engineering, and blanket. (U.K.).

38877 (CONF-880417—18) **Design analysis and optimization of self-cooled lithium blankets and shields.** Gohar, Y. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 21p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88010008/JAW.

From International symposium on nuclear fusion technology; Tokyo, Japan (10 Apr 1988).

A study of self-cooled lithium blankets was carried out to define the performance of these blankets and to determine the potential to operate at the maximum possible values of the performance parameters. The main design parameters considered during the course of the study were the tritium breeding ratio, the blanket energy multiplication factor, the energy fraction lost to the shield, the total blanket thickness, the reflector material selection, and the compositions of the different blanket zones. Another study was carried out to determine materials, compositions, arrangements, and thickness of the shield zone for the reference blanket. Helium and water-cooled shields were optimized for the inboard and outboard sections of the reactor. Based on the above two studies, the reference blanket and shield configurations were developed for the ANL Tokamak Power Systems Study. The helium-cooled shield was selected for use with liquid metal blankets to reduce safety concerns related to lithium-water reactivity. This helium-cooled shield provides shielding characteristics similar to a conventional water-cooled shield. The analyses and results from these studies are the subject of this paper. 12 refs., 4 figs., 2 tabs.

38878 (CONF-880512—6) **Initial operation and edge plasma studies in ATF [Advanced Toroidal Facility].** Mioduszewski, P.K.; Bell, J.D.; Bigelow, T.S.; Colchin, R.J.; Crume, E.C.; Dunlap, J.L.; Dyer, G.R.; England, A.C.; Glowienka, J.C.; Halliwell, J.W. (Oak Ridge National Lab., TN (USA); Kyoto Univ. (Japan)). 1988. Contract AC05-84OR21400. 17p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011400/JAW.

From 8. international conference on plasma surface interactions in controlled fusion devices; Julich, F.R. Germany (2 May 1988).

Initial plasmas have been obtained in the Advanced Toroidal Facility (ATF) at Oak Ridge. During the first operating period all major systems worked well. Currentless plasmas have been formed with electron-cyclotron heating (ECH) and neutral beam injection (NBI). Plasma breakdown is achieved with 200 kW of microwave power using the second harmonic of the 53 GHz gyrotron at 1 T. Because of the insufficient initial cleanup state of the vessel, the density evolution during the discharge is dominated by impurity influxes due to plasma-wall interactions. Wall conditioning has so far been performed with glow discharge and electron-cylcotron resonance discharge cleaning, with the walls at room temperature. Plasma edge studies are in preparation. They are focused on experiments leading to a divertor concept for ATF. During this brief operating period, plasma conditions were dominated by wall interactions. It is expected that during the next period additional wall conditioning techniques will lead to improved plasma performances. 9 refs., 6 figs.

38879 (CONF-880613—2) **Reduced-activation austenitic stainless steels: The Fe--Mn--Cr--C system.** Klueh, R.L.; Maziasz, P.J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 28p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008091/JAW.

From 14. international symposium on effects of radiation on materials; Andover, MA, USA (27 Jun 1988).

Nickel-free manganese-stabilized steels are being developed for fusion-reactor applications. As the first part of this effort, the austenite-stable region in the Fe--Mn--Cr--C system was determined. Results indicated that the Schaeffler diagram developed for Fe--Ni--Cr--C alloys cannot be used to predict the constituents expected for high-manganese steels. This is true because manganese is not as strong an austenite stabilizer relative to δ-ferrite formation as predicted by the diagram, but it is a stronger austenite stabilizer relative to martensite than predicted. Therefore, the austenite-stable region for Ne--Mn--Cr--C alloys occurs at lower chromium and hugher combinations of manganese and carbon than predicted by the Schaeffler diagram. Development of a manganese-stabilized stainless steel should be possible in the composition range of 20 to 25% Mn, 10 to 15% Cr, and 0.01 to 0.25%C. Tensile behavior of an Fe--20%Mn--12%Cr--0.25%C alloy was determined. The strength and ductility of this possible base composition was comparable to type 316 stainless steel in both the solution-annealed and cold-worked condition.

38880 (CONF-8710321—1) **Dosimetry and cross section measurements at RTNS II.** Greenwood, L.R.; Kneff, D.W. (Argonne National Lab., IL (USA); Rockwell International Corp., Canoga Park, CA (USA)). 1987. Contract W-31109-ENG-38. 11p. NTIS, PC A03. Order Number DE88009972/JAW.

From Workshop on final RTNS II experiments; Monterrey, CA, USA (15 Oct 1987).

Numerous measurements have been conducted at TRNS-II in order to map the neutron field for materials irradiations, to measure activation cross sections, and to measure helium production cross sections. Experiments of up to two weeks duration irradiated large numbers of activation dosimetry and helium samples both close to the source and throughout the target room. Many other samples have been irradiated in piggy-back positions over periods lasting many months. All of these experiments fall into four main classes, namely, fluence-mapping, activation dosimetry, the production of long-lived isotopes, and helium generation measurements. Radiometric dosimetry and activation cross section measurements were performed at Argonne National Laboratory; helium production was measured at Rockwell International Corporation. This

paper briefly summarizes the principal results of our measurements at RTNS-II; references are given for more detailed publications. 14 refs., 4 figs.

38881 (CONF-8805126—1) ITER plasma equilibrium and poloidal field system design. Strickler, D.J.; Galambos, J.D.; Peng, Y.K.M. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 14p. (CONF-8805126—). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011005/JAW.

From PF systems workshop; Garching, F.R. Germany (5 May 1988).

Several poloidal field coil design issues are identified when assessing the benefits of high plasma elongaton in an ITER device. Among these are the sensitivity of PF ampere-turens and coil energy to specific constraints on the plasma shape and profiles and the optimal placement of PF coils subject to assumed operating scenarios. Two versons of free boundary equilibrium codes presently under development at the Oak Ridge National Laboratory (ORNL), HEQ and VEQ, are used to solve several PF design problems related to these issues. Recent efforts have been directed toward problems in the analysis of highly elongated, magnetically-limited plasmas, such as X-point and divertor strike-point placement and control. In this report, we describe the capabilities of HEQ and discuss the major options available to the user. Applications of HEQ and VEQ in the area of plasma elongation tradeoff studies are presented. 8 refs., 4 figs., 4 tabs.

38882 (ENEA-RT-TIB—87-28) Spectral properties of undulators radiation. A numerical method. Barbini, R.; Ciocci, F.; Dattoli, G.; Torre, A.; Giannessi, L. (ENEA, Rome (Italy)). 1987. 26p. (CONF-8706192—). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701806/JAW.

From Conference on undulator magnets for synchrotron radiation and free electron lasers; Trieste, Italy (23 Jun 1987).

Results are presented of a numerical code dedicated to the analysis of the spectral features of the undulator radiation. The developed numerical model includes the near-field effects, the inhomogeneous broadening due to the electron beam energy spread and emittances and the magnetic field random magnetization errors.

38883 (ENEA-RT-TIB—87-31) Linking the plasma code EDGE2D to the neutral code NIMBUS for a self consistent transport model of the boundary. De Matteis, A. (ENEA, Rome (Italy)). 1987. 24p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702232/JAW.

This report describes the fully automatic linkage between the finite difference, two-dimensional code EDGE2D, based on the classical Braginskii partial differential equations of ion transport, and the Monte Carlo code NIMBUS, which solves the integral form of the stationary, linear Boltzmann equation for neutral transport in a plasma. The coupling has been performed for the real poloidal geometry of JET with two belt-limiters and real magnetic configurations with or without a single-null point. The new integrated system starts from the magnetic geometry computed by predictive or interpretative equilibrium codes and yields the plasma and neutrals characteristics in the edge.

38884 (GA—A19183) Infrared thermography of the DIII-D divertor targets. Baxi, C.; Ellis, R.; Ferguson, W.; Hill, D.H.; Perkins, D.E.; Petrie, T. (General Atomics Co., San Diego, CA (USA)). Feb 1988. Contract AC03-84ER51044. 13p. (CONF-880364—26). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010829/JAW.

From 7. topical conference on high temperature plasma diagnostics; Napa, CA, USA (13 Mar 1988).

The power flow to the DIII-D divertor targets is routinely measured using infrared (IR) thermography. An IR television camera sensitive to radiation in the 8–12 μm range views the divertor region using a set of germanium optics. Digital signal processing is used to extract the desired surface temperature profiles from the analog data (≈20 Mbytes) stored on videotape. Inversion of these data using a simple matrix formulation of the inverse heat conduction problem then yields the incident heat flux as a function of space and time. Results from a DIII-D discharge are included. 5 refs., 4 figs.

38885 (GA—A19186) Neutral beam current driven operation of the DIII-D tokamak. Simonen, T.C.; Bhadra, D.K.; Burrell, K.H.; Callis, R.W.; Chance, M.S.; Chu, M.S.; Colleraine, A.P.; Greene, J.M.; Groebner, R.J.; Harvey, R.W.; Hill, D.N.; Kim, J.; Lao, L.; Matsuoka, M.; Petersen, P.I.; Porter, G.D.; St. John, H.; Stallard, B.W.; Stambaugh, R.D.; Strait, E.J.; Taylor, T.S. (General Atomic Co., San Diego, CA (USA)). Mar 1988. Contract W-7405-ENG-48;AC03-84ER51044;AC02-76CH03073. 10p. (CONF-880534—6). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010831/JAW.

From 15. European conference on controlled fusion and plasma heating; Dubrovnik, Yugoslavia (16 May 1988).

Neutral beam current drive experiment in the DII-D tokamak with a single null poloidal divertor are described. A plasma current of 0.34 MA has been sustained entirely by neutral beams with H-mode quality energy confinement. Poloidal beta values reach 3.5 without disruption or coherent magnetic activity, suggesting that these plasmas may be entering the second stability regime. 12 refs., 2 figs.

38886 (GA-A—18909) Recent results of divertor experiments on DIII-D. Ali Mahdavi, M.; Allen, S.; Brooks, N.H.; Content, D.; DeBoo, J.C.; Gohil, P.; Haas, G.; Heifetz, D.; Hill, D.N.; Hsieh, C.L.; Hulse, R.; Jackson, G.L.; Lao, L.; Ohyabu, N.; Perkins, S.; Perry, M.E.; Petrie, T.W.; Rensink, M.E.; Scoville, T.; Shimada, M.; Snider, R.T.; Stockdale, R.E.; Wood, R. (General Atomics Co., San Diego, CA (USA)). Jul 1987. Contract AC03-84ER51044;W-7405-ENG-48. 57p. (CONF-8707156—1). NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88007930/JAW.

From 14. session of the INTOR phase 2A workshop; Vienna, Austria (13 Jul 1987).

Results of recent experiments on DIII-D ohmic and neutral beam injection heated plasmas which provide further evidence of the role of the edge plasma on stability and confinement of the core plasma are presented. The presentation is organized into three independent sections. The first section describes the results of detailed thermography on the divertor tiles during plasma heating. Section 2 presents results of detailed electron temperature and density profile measurements. The last section is devoted to a discussion of radiation and power balance. 15 refs., 42 figs.

38887 (GA-A—19239) Overview of the TITAN-II reversed-field pinch aqueous fusion power core design. Wong, C.P.C.; Creedon, R.L.; Grotz, S.; Cheng, E.T.; Sharafat, S.; Cooke, P.I.H. (General Atomics Co., San Diego, CA (USA); California Univ., Los Angeles (USA)). Mar 1988. Contract AC03-84ER53158. 15p. (CONF-880417—6). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008170/JAW.

From International symposium on nuclear fusion technology; Tokyo, Japan (10 Apr 1988).

TITAN-II is a compact, high power density Reversed-Field Pinch fusion power reactor design based on the aqueous lithium solution fusion power core concept. The selected breeding and structural materials are $LiNO_3$ and 9-C low activation ferritic steel, respectively. TITAN-II is a viable alternative to the TITAN-I lithium self-cooled design for the Reversed-Field Pinch reactor to operate at a neutron wall loading of 18 MWm^2. Submerging the complete fusion power core and the primary loop in a large pool of cool water will minimize the probability of radioactivity release. Since the protection of the large pool integrity is the only requirement for the protection of the public, TITAN-II is a passive safety assurance design. 13 refs., 3 figs., 1 tab.

38888 (INIS-BR—1018, pp 17) Thermonuclear reactors. Reis, S.T. dos. (Pernambuco Univ., Recife (Brazil). Dept. de Fisica). 1987. (In Portuguese). NTIS (US Sales Only), PC A04/MF A01. Order Number DE88702601/JAW. (CONF-8711187—).

From 5. meeting of physicists from northeast; Natal, Brazil (12 Nov 1987).

38889 (JINR-R—4-87-82) Kinetics of muon catalysis processes in a deuterium-tritium mixture. 1. Quasistationary approximation. Men'shikov, L.I.; Fajfman, M.P.; Somov, L.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems). 1987. 24p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702931/JAW.

Submitted to the journal ZhEhTF and Organizing Comittee on International Conference Muon Catalysis - 87, Leningrad, May, 1987.

A quasistationary mode of muon catalysis in a D_3+T_3 mixture, established in the time region $t >> \lambda/sub\ eff/^{-1}$ ($\lambda/sub\ eff/^{-1}$ is the lifetime of the mesomolecule dtμ). Energy distribution functions are calculated for tμ atoms in the 1s state. The calculated spectrum of tμ mesoatoms differs from the Maxwell distribution by no more than 10 per cent. Difference between the values of the resonance dtμ production rate averaged by the calculated and Maxwell functions is 5%. 36 refs.; 6 figs.; 1 tab.

38890 (KFK—4339) Nuclear Fusion Project. Semi-annual report of the Association KfK/EURATOM. April-September 1987. Kast, G. (comp.). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Kernfusion). Dec 1987. 79p. (EUR—10539e). NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753581/JAW.

Short communications give a survey of 38 technology tasks, the development of ECRH power sources at 150 GHz, and 8 NET study contracts. The fusion technology contracts and the NET contracts are listed in the appendices I and II, respectively, while the KfK departments contributing to the Fusion Project and the Fusion Project Management Staff are listed in appendices III and IV, respectively.

38891 (LA—11203-MS) Poloidal field coil stress analysis for the ZTH machine. Girrens, S.P.; Bennett, J.G.; Murphy, D.M. (Los Alamos National Lab., NM (USA)). Feb 1988. Contract W-7405-ENG-36. 47p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88005308/JAW.

Three-dimensional finite element analysis of representative equilibrium field and ohmic heating coils for the Los Alamos ZTH air core machine was performed to determine static stress levels developed within the coil structure caused by Lorentz-force loading. Because of the complex coil configuration in cross section (copper conductors embedded in an epoxy insulating matrix), the study was performed in three steps: a bulk orthotropic material property determination, a bulk material coil section analysis, and a detailed composite cross section of selected thickness analysis. Computational procedures used with coil stress and displacement results that were obtained are presented. Extensive work was performed to investigate the magnitude of the error in coil stress predictions arising from the use of the three-step analysis procedure. Analytical and numerical procedures used to perform the estimate of error study are also presented. 34 figs.

38892 (LA-UR—88-814) Conceptual design of a reversed-field pinch fusion neutron source. Bathke, C.G.; Krakowski, R.A.; Manzanares, R.G.; Miller, R.L.; Werley, K.A. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 20p. (CONF-880417—5). NTIS, PC A03/MF A01; GPO Dep. Order Number TI88007895/JAW.

From International symposium on nuclear fusion technology; Tokyo, Japan (10 Apr 1988).

The conceptual design of an ohmically-heated, reversed-field pinch (RFP) operating with a 5-MWm^2 steady-state DT fusion neutron wall loading while generating {approximately}100-MW total fusion power is presented. These results are also useful in projecting the development of an economic source of DT neutrons for large-volume ({approximately}10 m^3) fusion nuclear testing. 6 refs., 4 figs., 5 tabs.

38893 (LA-UR—88-820) US team measurements during the June 1987 experimental HT release at the Chalk River Nuclear Laboratories, Ontario, Canada. Jalbert, R.A.; Murphy, C.E. (Los Alamos National Lab., NM (USA); Savannah River Lab., Aiken, SC (USA)). 1988. Contract W-7405-ENG-36. 6p. (CONF-880505—11). NTIS, PC A02/MF A01; GPO Dep. Order Number TI88007894/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

In June 1987, an experiment was performed at the Chalk River Nuclear Laboratories in Ontario, Canada, to study the oxidation of HT in the environment. The experiment involved a 30-minute release of 100 Ci of HT to the atmosphere at an elevation of one meter. The HTOHT ratios were shown to slowly increase downwind ({approximately}4 {times} 10/sup {minus/5} at 50 meters to almost 10/sup {minus/3 at 400 meters) as conversion of HT takes place. For several days after the release, HTO concentrations in the atmosphere remained elevated. Freeze-dried water from vegetation samples was found to be very low in HTO immediately after the release suggesting a very low direct uptake of HTO in air by vegetation. The tritiated water concentration increased during the first day, peaking during the second day (about 400 to 600 pCi/ml of water at 50 meters from the source) and decreasing by the end of the second day. The organically bound tritium continued to accumulate during the period following exposure (about 10 pCi/gm dry weight at 50 meters after two days). 4 refs., 6 figs., 2 tabs.

38894 (LA-UR—88-871) Some new techniques in tritium gas handling as applied to metal hydride synthesis. Nasise, J.E. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 16p. (CONF-880505—12). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007839/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

A state-of-the-art tritium Hydriding Synthesis System (HSS) was designed and built to replace the existing system within the Tritium Salt Facility (TSF) at the Los Alamos National Laboratory. This new hydriding system utilizes unique fast-cycling 7.9 mole uranium beds (47.5g of T at 100% loading) and novel gas circulating hydriding furnaces. Tritium system components discussed include fast-cycling uranium beds, circulating gas hydriding furnaces, valves, storage volumes, manifolds, gas transfer pumps, and graphic display and control consoles. Many of the tritium handling and processing techniques incorporated into this system are directly applicable to today's fusion fuel loops. 12 refs., 7 figs.

38895 (ORNL/TM—10572) Compact torsatron reactors. Lyon, J.F.; Carreras, B.A.; Lynch, V.E.; Tolliver, J.S.; Sviatoslavsky, I.N. (Oak Ridge National Lab., TN (USA)). May 1988. Contract AC05-84OR21400. 49p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010755/JAW.

Low-aspect-ratio torsatron configurations could lead to compact stellarator reactors with R_0 = 8–11m, roughly one-half to one-third the size of more conventional stellarator reactor designs. Minimum-size torsatron reactors are found using various assumptions. Their size is relatively insensitive to the choice of the conductor parameters and depends mostly on geometrical constraints. The smallest size is obtained by eliminating the tritium breeding blanket under the helical winding on the inboard side and by reducing the radial depth of the superconducting coil. Engineering design issues and reactor performance are examined for three examples to illustrate the feasibility of this approach for compact reactors and for a medium-size ($R_0 \simeq$ 4 m,{bar a} {approx<~lt} 1 m) copper-coil ignition experiment. 26 refs., 11 figs., 7 tabs.

38896 (PPPL—2523) Tritium retention in TFTR. Dylla, H.F.; Wilson, K.L. (eds.). (Princeton Univ., NJ (USA). Plasma Physics Lab.; Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC02-76CH03073;AC04-76DP00789. 130p. (SAND—88-8212). NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88011877/JAW.

This report discusses the materials physics related to D-T operation in TFTR. Research activities are described pertaining to

basic studies of hydrogenic retention in graphite, hydrogen recycling phenomena, first-wall and limiter conditioning, surface analysis of TFTR first-wall components, and estimates of the tritium inventory.

38897 **(SAND—87-2716) A model for diffusion in the tokamak edge and application to the modular pump limiters on Tore Supra.** McGrath, R.T. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 55p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010154/JAW.

The relative positioning of the limiter modules on Tore Supra is investigated with the objective of optimizing the overall performance of the system and the operational flexibility of the experiment. Working within the constraints imposed by the availability of ports on Tore Supra, the best limiter configuration for a system of seven modular limiters is identified. The performance to be expected for this optimized configuration for various modes of Tore Supra operation is reported. We find that very long flux tubes must be avoided if the limiter system is to operate near its full design capacity of 8.0 MW. For the assumed edge conditions, as discussed in the text, Bohm diffusion with a plasma temperature of 150 eV at the last closed flux surface, the configuration identified can exhaust between 17--21 torr{minus}1/s while removing 5--8 MW of power incident on the limiter surfaces. Operational modes that pump as much as 26 torr{minus}1/s are also possible if incident power levels are reduced to 4.0 MW. Operation with large amounts of auxiliary heating, in excess of 15 MW, is also possible by power sharing with the actively cooled inner bumper limiter. In this situation particle pumping rates may be as low as 9 torr{minus}1/s. 19 refs., 11 figs., 1 tab.

38898 **(SAND—88-0764) Target designs for plasma-implosion-driven, photoionization-pumped soft x-ray lasers.** Hussey, T.W.; Matzen, M.K.; McGuire, E.J.; Dalhed, H.E. (Sandia National Labs., Albuquerque, NM (USA); Lawrence Livermore National Lab., CA (USA)). May 1988. Contract AC04-76DP00789. 46p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011278/JAW.

Designs are proposed for layered, hollow cylindrical targets to be placed on the axis of an imploding, hollow Z-pinch plasma that can create the approximate plasma conditions, as well as radiation spectrum, for a photoionization pumped, Ne-like recombination laser. The lasant must research the Ne-like state and be at the appropriate density concurrent with the photoionizing pump radiation. This places severe constraints on designs for such targets with the vertical vacuum feed diode on Proto 2. Target designs are further constrained by the fact that the 3s--2p resonance line, which depopulates the lower lasing state, must not be highly trapped and by the fact that the upper lasing state must not be collisionally depopulated. We find that hollow, cylindrical targets consisting of a few micron CH strongback, coated on the inside with a thin layer of Ni lasant and on the outside with an Al converter layer, can be optimized to acheive appropriate conditions for lasing. We note that a trade-off exists between larger targets, which better isolate the target from the shock of stagnation, and smaller targets, which deliver a higher intensity pump flux. We also find that trapping, together with uncertainties in the inward expansion of the lasant layer, are significant, and may limit optium available gain. 30 refs., 22 figs., 1 tab.

38899 **(SAND—88-1072) Proceedings of U.S.-Japan workshop Q86 on plasma-materials interaction/high heat flux data needs for the next step and steady state devices.** Whitley, J. B.; Miyahara, A. (eds.). (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 510p. (CONF-8803111—). NTIS, PC A22;3. Order Number DE88011539/JAW.

From U.S.-Japan workshop Q86 on plasma-materials interaction/high heat flux data needs for the next step and steady state devices; Albuquerque, NM, USA (7 Mar 1988).

This workshop was the third in a series carried out as part of the US-Japan Fusion Cooperation Program. The primary objective of this workshop was to complete the assessment of data on graphite that was begun earlier. A second objective was to assemble the data on graphite in such a way as to serve as a basis with which to compare the features of other candidate materials. Finally, an attempt was made to summarize relevant engineering experience to provide guidelines for component design. The talks are grouped into four broad categories: plasma-materials interactions, neutron effects, hight heat flux phenomena, and engineering issues. Working groups for each of these areas discussed the current status and provided summaries of research. The individual papers in this report vary in format. A great deal of the data is preliminary in nature. Some researchers have included formal discussions of their research, but most of the material in this document are reproductions of slides and viewgraphs presented at the meeting with little explanatory text. (DWL)

38900 **(TRITA-PFU—86-10) Studies of the transformer core performance for a toroidal Extrap Z-pinch discharge experiment.** Bures, M.; Drake, J.R.; Eninger, J.E. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics and Fusion Research). Oct 1986. 16p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752502/JAW.

Extrap is the collective name given to a series of Z-pinch discharge experiments which are distinguished by the fact that the cross-section of the discharge current channel is non-circular. The Extrap toroidal discharge is driven as the secondary of a pulse transformer circuit which has a characteristic operational frequency of about 20 kHz. The key component in this circuit is a high permeability transformer core. Three test core segments have been studied under conditions similar to those of the Extrap experiments. All of the cores were wound using thin, 50-mm wide band with a build of 200 mm and the magnetic length of the cores is about 3 m. Two of the test cores were manufactured from 0.051-mm Si-Fe band while the third was manufactured from 0.025-mm metallic glass band. For all the cores, the measured flux swings at 20 kHz operation are close to values corresponding to the DC saturation permeabilities of the respective materials. In addition, one of the cores has been used on the toroidal Extrap experiment in studies of toroidal discharge breakdown and current build-up under Extrap conditions. Loop voltages of up to 4.5kV were applied and current rates of rise of up to 2x10/sup9/ As/sup-1/ have been achieved. (authors).

38901 **(TRITA-PFU—87-01) Bootstrap states of the Z-pinch.** Lehnert, B. (Royal Inst. of Tech., Stockholm (Sweden). Dept. of Plasma Physics and Fusion Research). Jan 1987. 20p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88752505/JAW.

Steady bootstrap states of a Z-pinch are investigated both in absence and in presence of an imposed axial magnetic field, in terms of MHD theory with classical resistivity. The results indicate that bootstrap operation should become possible for certain classes of plasma profiles and that such operation can lead to higher bootstrap currents in a Z-pinch without axial magnetic field than in a tokamak-like case under similar plasma conditions. The ratio between the latter and the former currents is of the order of the square root of the beta value in the tokamak-like case. A simple numerical example is given on boot-strap operation in the Z-pinch. Neoclassical or anomalous diffusion will increase the diffusion velocity of the plasma but are not expected to affect the main physical features of the present results. This applies also to the kinetic effects in the weak-field region near the axis of the Z-pinch, because these effects can largely be described by MHD-like equations for a steady equilibrium. Bootstrap operation and the technical difficulty in realizing a volume distribution of particle sinks introduce certain constraints on the plasma and current profiles. This has to be taken into account in a stability analysis. The latter cannot only be performed in terms of MHD-like theory but has to be based on kinetic theory including large Larmor radius (LLR) effects.

38902 **(UCRL—96655) Plans for the CIT [Compact Ignition Tokamak] instrumentation and control system.** Preckshot, G.G. (Lawrence Livermore National Lab., CA (USA)). 7 Oct 1987. Contract W-7405-ENG-48. 5p. (CONF-871007—100). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011323/JAW.

From 12. symposium on fusion engineering; Monterey, CA, USA (12 Oct 1987).

Extensive experience with previous fusion experiments (TFTR, MFTF-B and others) is driving the design of the Instrumentation and Control System (I and C) for the Compact Ignition Tokamak (CIT) to be built at Princeton. The new design will reuse much equipment from TFTR and will be subdivided into six major parts: machine control, machine data acquisition, plasma diagnostic instrument control and instrument data acquisition, the database, shot sequencing and safety interlocks. In a major departure from previous fusion experiment control systems, the CIT machine control system will be a commercial process control system. Since the machine control system will be purchased as a completely functional product, we will be able to concentrate development manpower in plasma diagnostic instrument control, data acquisition, data processing and analysis, and database systems. We will discuss the issues driving the design, give a design overview and state the requirements upon any prospective commercial process control system.

38903 (UCRL—97379) Reactor applications of the compact fusion advanced Rankine (CFAR) cycle for a D-T tokamak fusion reactor. Hoffman, H.A.; Logan, B.G.; Campbell, R.B. (Lawrence Livermore National Lab., CA (USA)). Mar 1988. Contract W-7405-ENG-48. 17p. (CONF-880417—21). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011351/JAW.

From International symposium on nuclear fusion technology; Tokyo, Japan (10 Apr 1988).

We have made a preliminary design of a D-T fusion reactor blanket and MHD power conversion system based on the CFAR concept, and found that the performance and costs for the reference cycle are very attractive. While much remains to be done, the potential advantage of liquid metal Rankine cycles for fusion applications are much clearer now. These include low pressures and mass flow rates, a nearly isothermal module shell which minimizes problems of thermal distortion and stresses, and an insensitivity to pressure losses in the blanket so that the two-phase MHD pressure drops in the boilling part of the blanket and the ordinary vapor pressure drops in the pebble-bed superheating zones are acceptable (the direct result of pumping a liquid rather than having to compress a gas). There are no moving parts in the high-temperature MHD power generators, no steam bottoming plant is required, only small vapor precoolers and condensers are needed because of the high heat rejection trmperatures, and only a relatively small natural-draft heat exhanger is required to reject the heat to the atmosphere. The net result is a very compact fusion reactor and power conversion system which fit entirely inside an 18 meter radius reactor vault. Although we have not yet performed a detailed cost analysis, preliminary cost estimates indicate low capital costs and a very attractive cost of electricity. 11 refs., 5 figs., 2 tabs.

38904 (UCRL—97520) A new box system for a high pressure tritium pump. Wilson, S.W.; Borree, R.J.; Chambers, D.I.; Souers, P.C.; Merrill, J.T.; Wiggins, R.K. (Lawrence Livermore National Lab., CA (USA)). 1988. Contract W-7405-ENG-48. 15p. (CONF-880505—22). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011334/JAW.

From 3. topical meeting on tritium technology in fission, fusion and isotopic applications; Toronto, Canada (1 May 1988).

A 200 MPa (30 kpsi) high pressure tritium pump inside a box system is described. This system is currently under construction but all representative mechanical parts have been fabricated and tested. The pump is a conventional mechanical-plus-cryostaged system, so that most of the interesting features are in the box. The system contains nine separate sections, with automatic pressure balancing and venting systems. Five sections are hood-to-box convertible enclosures with inflatable door seals. The procedure of cryostaging with liquid argon is described. Special detail is given to valves and motor shaft seals. 3 refs., 4 figs.

38905 (UCRL—98419) Four-frame gated optical imager with 120-ps resolution. Young, P.E.; Hares, J.D.; Kilkenny, J.D.; Phillion, D.W.; Campbell, E.M. (Lawrence Livermore National Lab., CA (USA)). Apr 1988. Contract W-7405-ENG-48. 20p. (CONF-880364—30). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011735/JAW.

From 7. topical conference on high temperature plasma diagnostics; Napa, CA, USA (13 Mar 1988).

In this paper we describe the operation and applications of a framing camera capable of four separate two-dimensional images with each frame having a 120-ps gate width. Fast gating of a single frame is accomplished by using a wafer image intensifier tube in which the cathode is capacitively coupled to an external electrode placed outside of the photocathode of the tube. This electrode is then pulsed relative to the microchannel plate by a narrow (120 ps), high-voltage pulse. Multiple frames are obtained by using multiple gated tubes which share a single bias supply and pulser with relative gate times selected by the cable lengths between the tubes and the pulser. A beamsplitter system has been constructed which produces a separate image for each tube from a single scene. Applications of the framing camera to inertial confinement fusion experiments are discussed.

38906 (UWFDM—686) SIRIUS-M: A symmetric illumination, inertially confined direct drive materials test facility. Abdel-Khalik, S.I.; Attaya, H.; Engelstad, R.L.; Kulcinski, G.L.; Liang, J.H.; Lovell, E.G. (Wisconsin Univ., Madison (USA). Fusion Technology Inst.). Apr 1986. Contract AS08-86DP10529. 27p. (CONF-860421—82). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008059/JAW.

From 2. international conference on fusion reactor materials (ICFRM-2); Chicago, IL, USA (13 Apr 1986).

SIRIUS-M is a fusion materials test facility designed to duplicate the time-dependent radiation damage structure unique to ICF systems in order to provide the technology base necessary for an ICF demonstration facility. Single-shell ICF targets are symmetrically illuminated by 32 beams of a KrF laser with a total laser energy of 1 MJ. A wall loading of 2 MWm^2 is achieved at a repetition rate of 10 Hz and target gain of 13.4. Xenon gas at a pressure of 133 Pa (1 torr) is placed in the 2 m radius, graphite-tiled cavity in order to protect the first wall from the x-rays and ions produced by the explosions. Two circular test modules are used in SIRIUS-M. Each module has a front surface area of 1 m^2 and fits between three beam ports. No significant radial and azimuthal damage variation in the module results from these penetrations. The peak dpa rate is 24 dpaFPY yielding a peak accumulated damage of 120 dpa at the end of life of the SIRIUS-M facility. A total volume-integrated-damage figure of merit of 2840 dpa-{ell} per full power year can be achieved in SIRIUS-M. 14 refs., 8 figs., 2 tabs.

38907 Low-density resorcinol—formaldehyde aerogels for direct-drive laser inertial confinement fusion targets. Hair, L.M.; Pekala, R.W.; Stone, R.E.; Chen, C.; Buckley, S.R. (University of California, Lawrence Livermore National Laboratory, Livermore, California 94550). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 6: No. 4, 2559-2563(Jul 1988).

Resorcinol—formaldehyde (RF) aerogels satisfy inertial confinement fusion requirements for cell size and density. The cell size is <0.1 μm for densities ranging from 65 to 100 mg/cm^3. Uniformity as measured by x-ray radiography appears good, but careful machining of the RF piece is needed to prevent machine marks from interfering with interpretation. The RF aerogel is wettable with liquid hydrogen, and can be machined to 7-μm surface finish. Stability of that surface over time needs to be improved. Radiation stability, methods of gluing and overcoating, and the thermal expansion coefficient still need to be determined.

38908 Mode conversion and absorption of lower hybrid waves in inhomogeneous magnetic fields. Cho, S.; Swanson, D.G. (Department of Physics, Auburn University, Auburn, Alabama 36849). *Physics of Fluids;* 31: No. 7, 1968-1978(Jul 1988).

When a cold lower hybrid wave propagates in an inhomogeneous plasma, it undergoes a total mode conversion to the warm wave which is then coupled with the ion Bernstein wave around ion cyclotron harmonic frequencies. Both types of linear mode conversion problems can be described by fourth-order differential equations if the two processes are separated from each other. The combination of the two types of mode conversion when the lower hybrid turning point is in the vicinity of a cyclotron harmonic re-

quires a sixth-order equation with a quadratic coefficient, which is not solvable analytically nor numerically. Another type of sixth-order equation, which has only linear coefficients and represents the three-wave problem marginally, is solved analytically without including the absorption term. Finally, the damping and the absorption of the wave are compared for the unmagnetized dispersion relation, the full magnetized dispersion relation, and the mode conversion analysis as the wave propagates in a magnetically confined plasma with slab geometry.

38909 **Vacuum-assisted contaminated-particulate removal.** Watson, W. (Laboratory for Laser Energetics, University of Rochester, Rochester, New York 14623-1299). *Journal of Vacuum Science and Technology, A: Vacuum, Surfaces, and Films;* 6: No. 4, 2568-2570(Jul 1988).

In many research projects, experiments are conducted which involve chemical radiological contamination of microscopic particulate matter in vacuum chambers. Inertial confinement fusion experiments, for example, often result in a residue of radioactive particulate matter on a scale of microns on the inside of the vacuum vessel. Removal of this particulate matter would present hazards to personnel. This paper describes a method of removal of this particulate matter using a vacuum containment vessel and filtration medium which limits personnel exposure.

38910 **Fusion power monitor.** Pettus, W.G.; Warren, H.D. (to Babcock and Wilcox Co., New Orleans, LA). US Patent 4,735,763. 5 Apr 1988. Filed date 13 Oct 1981. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A power monitoring system for a fusion reactor of the type having a plasma region contained within a vacuum vessel by a magnetic field is described comprising: radiation detection means; an activation medium; and circulation means for circulating the activation medium by the vacuum vessel and by the radiation detection means wherein the circulation means includes a feed tube penetrating the fusion reactor to the vacuum vessel, a loop tube fed by the feed tube and passing over the vacuum vessel wherein the activation fluid is activated, and a return tube fed by the loop tube and extending out of the fusion reactor and to the radiation detection means.

38911 **Flexible helical-axis stellarator.** Harris, J.H.; Hender, T.C.; Carreras, B.A.; Cantrell, J.L.; Morris, R.N. (to Dept. of Energy, Washington, DC). US Patent 4,735,765. 5 Apr 1988. Filed date 26 Nov 1985. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

In a helical-axis stellarator of the type including a planar circular central winding, a planar toroidal magnetic field generating coils disposed about the central winding whose centers are located on a helical axis twisting about and spaced from the central winding to form a toroidal helix having M toroidal periods in which a helical axis plasma is magnetically confined, the improvement is described comprising: an l=1 helical winding, where l is the toroidal winding multiplicity, disposed to spiral about and encompass the planar circular central winding one revolution for each period of the toroidal helix in close proximity to the central winding and in phase with the helical axis of the plurality of toroidal magnetic field generating coils so that currents in the helical winding and the central winding may be separately varied to contain the rotational transform, tau, of closed magnetic flux surfaces which confine the helical axis plasma for stably confining the plasma at finite beta values. The helical winding include separate winding layers disposed radially outward from the central winding so that separate currents may be applied to the separate layers of the l=1 helical winding to effectively vary the radial space relationship of the effective center of the l-1 helical winding relative to the central winding thereby varying the shear of the magnetic flux surfaces.

38912 **Laser or charged-particle-beam fusion reactor with direct electric generation by magnetic flux compression.** Lasche, G.P. (to Dept. of Energy, Washington, DC). US Patent 4,735,762. 5 Apr 1988. Filed date 20 Feb 1987. vp. Patent and Trademark Office, Box 9, Washington, DC 20232.

A method for recovering energy in an inertial confinement fusion reactor having a reactor chamber and a sphere forming means positioned above an opening in the reactor chamber is described, comprising: embedding a fusion target fuel capsule having a predetermined yield in the center of a hollow solid lithium tube and subsequently embedding the hollow solid lithium tube in a liquid lithium medium; using the sphere forming means for forming the liquid lithium into a spherical shaped liquid lithium mass having a diameter smaller than the length of the hollow solid lithium tube with the hollow solid lithium tube being positioned along a diameter of the spherical shaped mass, providing the spherical shaped liquid lithium mass with the fusion fuel target capsule and hollow solid lithium tube therein as a freestanding liquid lithium shaped spherical shaped mass without any external means for maintaining the spherical shape by dropping the liquid lithium spherical shaped mass from the sphere forming means into the reactor chamber; producing a magnetic field in the reactor chamber; imploding the target capsule in the reactor chamber to produce fusion energy; absorbing fusion energy in the liquid lithium spherical shaped mass to convert substantially all the fusion energy to shock induced kinetic energy of the liquid lithium spherical shaped mass which expands the liquid lithium spherical shaped mass; and compressing the magnetic field by expansion of the liquid lithium spherical shaped mass and recovering useful energy.

38913 **A novel non-power-producing fusion-fission breeder reactor.** Wrisley, K.L.; Steiner, D. (Rensselaer Polytechnic Institute, Dept. of Nuclear Engineering and Engineering Physics, Fusion Engineering Program, Troy, NY (US)). *Fusion Technology;* 13: No. 3, 453-462(Mar 1988).

One of the potentially attractive applications of nuclear fusion is to breed fissile fuel for use in fission reactors. A fusion-fission breeder is examined, based on four unique concepts: operations in a non-power-producing mode, a low technology (low pressure and temperature) aqueous self-cooled blanket for breeding fissile fuel, the spherical torus confinement scheme (low-aspect-ratio tokamak), and the catalyzed deuterium-deuterium (D-D) fuel cycle. The breeding of fissile fuel is accomplished by dissolving a uranium salt, i.e., uranyl nitrate, in heavy water that cools both the first wall and blanket. The use of the catalyzed D-D fuel cycle eliminates the need for tritium breeding. The neutron wall loading for this reactor is only —0.5 MW/m/sup 2/, and the fusion power output is —1000 MW(thermal). Analysis of this novel reactor concept indicates a fissile breeding ratio of 1.34 fissile atom/source neutron using a 15-cm beryllium moderator/multiplier region and 7 mol% uranyl nitrate in the heavy water. A typical reactor using this blanket can produce more than 7400 kg of plutonium per operating year. This concept can provide fissile fuel at a cost that is comparable to previous fusion breeder designs but at a capital cost of about one-third that of the previous designs.

38914 **Problems in modeling toroidal field ripple loss of fast alphas from a tokamak reactor.** Hively, L.M. (Oak Ridge National Lab., Oak Ridge, TN (US)). *Fusion Technology;* 13: No. 3, 438-446(Mar 1988).

The present status of modeling toroidal field (TF) ripple loss of fast alphas from tokamaks is summarized. The modeling issues are discussed, and several new aspect of this problem are described, including gyromotion, radial electric field, and sawtoothing. Existing models predict that TF ripple loss of fast alphas will have a low to moderate impact on the design of a tokamak engineering test reactor.

38915 **Heavy-ion linear induction accelerators as drivers for inertial fusion power plants.** Hovingh, J.; Brady, V.O.; Faltens, A.; Keefe, D.; Lee, E.P. (Univ. of California, Lawrence Livermore National Lab., Livermore, CA (US)). *Fusion Technology;* 13: No. 2, 255-278(Feb 1988).

A linear induction accelerator that produces a beam of energetic heavy ions (T — 10 GeV, A — 200 amu) is a prime candidate as a driver for an inertial fusion power plant. Some early perceptions were that heavy-ion drive fusion would not be cost-competitive with other power sources because of the high cost of the accelerators. However, improved understanding of the physics of heavy-ion transport and acceleration (supported by experimental results), combined with advances in accelerator technology, have resulted in accelerator design costs — 50% of previous estimates. As a result,

heavy-ion drive fusion power plants are now projected to be cost-competitive with other conceptual fusion power plants. A brief formulation of transport and acceleration physics is presented here, along with a description of the induction Linac cost optimization code LIACEP. Cost trends are presented and discussed, along with specific cost estimates for several accelerator designs matched to specific inertial fusion target yields. Finally, a cost-effective strategy using heavy-ion induction Linacs in a development scenario for inertial fusion is presented.

38916 **Concept of a blanket first wall supported by radial tubes.** Moir, R.W. (Lawrence Livermore National Lab., CA (USA)). *Fusion Engineering and Design;* **5**: No. 4, 379-383(Jan 1988). Contract W-7405-ENG-48.

This paper describes a new idea for the design of the first wall of a fusion reactor blanket. Radially oriented tubes are used to support the first wall and to channel coolant to the front of the blanket. A metal skin resembling a tufted or quilted seat cushion is supported in pure tension by the tubes. This thin skin, which forms the first wall, can contain the internal pressure of the blanket and yet be reasonably transparent to neutrons. The structural volume fraction is the minimum theoretically required, thus further enhancing neutron economy. Another advantage is the openness of the blanket interior, giving the blanket designer considerable freedom. The design appears to be resistant to radiation damage.

38917 **Multiplex Tokamak power plant.** Dabiri, A.E. (Science Applications International Corp., 11526 Sorrento Valley Road, San Diego, CA (US)). *Fusion Technology;* **13**: No. 1, 115-124(Jan 1988).

The concept of multiplexing for a fusion power core as an option for producing power is explored. Superconducting, as well as normal magnet, coils in either first or second stability regimes are considered. The results show that multiplex plants with superconducting magnets operating in the second stability regime could be competitive with the single-unit plants in some unit sizes. The key issues that impact the expected benefits of multiplexing must be investigated further. These are factory fabrication, economy of scale, the extent of equipment sharing, inherent safety, maintainability, and utility load management.

38918 **Tokamak Fusion Test Reactor central ignition scenarios.** Redi, M.H.; Zweben, S.J.; Bateman, G. (Princeton Univ., Plasma Physics Lab., Princeton, NJ (US)). *Fusion Technology;* **13**: No. 1, 57-86(Jan 1988).

The possibility of obtaining ignition in the Tokamak Fusion Test Reactor (TFTR) by means of very centrally peaked density profiles is examined. It is shown that local central alpha heating can be made to exceed local central energy losses ("central ignition") under global conditions for which $Q \geq 1$. Time-dependent one-dimensional transport simulations with a simplified transport model show that the normal global ignition requirements are substantially relaxed for plasmas wi*th peaked density profiles. More realistic simulations with recently developed profile-consistent microinstability based models for electron and ion confinement show that TFTR may form a small centrally ignited region if peaked central density can be maintained.

38919 **(DOE-tr—88-11) Summary of national programs: Main points of Japanese policy proposal.** (USDOE, Washington, DC). 1988. Translation source information not available. 6p. NTIS, PC A02;3.

This paper briefly discusses Japan's plans to develop thermonuclear energy and research already underway. (LSP)

38920 **Assessment of eddy current effects on compression experiments in the Tokamak Fusion Test Reactor.** Wong, K.L.; Park, W. (Princeton Plasma Physics Lab., Princeton Univ., James Forrestal Campus, P.O. Box 451, Princeton, NJ 08544 (US)). *Fusion Technology;* **12**: No. 3, 437-443(Nov 1987). Contract AC02-76CH03073.

The eddy current induced on the Tokamak Fusion Test Reactor vacuum vessel during compression experiments is estimated based on a cylindrical model. It produces an error magnetic field that generates magnetic islands at the rational magnetic surface. The widths of these islands are calculated and found to have some effect on electron energy confinement. However, resistive magnetohydrodynamic simulation results indicate that the island formation process can be slowed by plasma rotation.

38921 **Environmental effects of fusion power plants. Part II: Tritium effluents.** Watson, J.S.; Easterly, C.E.; Cannon, J.B.; Talbot, J.B. (Oak Ridge National Lab., Fusion Environmental Program, P.O. Box X, Oak Ridge, TN 37831 (US)). *Fusion Technology;* **12**: No. 3, 354-363(Nov 1987). Contract AC05-84OR21400.

Tritium releases from fusion reactors were estimated for normal (nonaccident) operating conditions. The STARFIRE reactor design was used as a reference case, but the effects of alternate design choices and conditions were also addressed. Potential environmental losses were examined for each of the major tritium handling systems. Estimates of —20 Ci/day were made for the 1000-MW (electric) reactor, with approximately equal portions coming from the gas handling systems (plasma, vacuum, and fuel systems) and from the coolant system.

38922 **Environmental effects of fusion power plants. Part I: Effluents other than tritium.** Cannon, J.B.; Easterly, C.E.; Davis, W. Jr.; Watson, J.S. (Oak Ridge National Lab., Fusion Environmental Program, Oak Ridge, TN 37831 (US)). *Fusion Technology;* **12**: No. 3, 341-353(Nov 1987). Contract AC05-84OR21400.

Radioactive and nonradioactive effluents are released routinely during normal operation of near-term commercial fusion power reactors. Nonradioactive effluents are essentially the same as those released at conventional steam-electric power plants. Radioactive effluents consist of activated corrosion products and tritium. Most radioactive releases originate from liquid-waste processing systems and from ventilation systems of various buildings where radioactivity may become airborne. These effluents have some potential for environmental impact; however, the significance of the impact depends in part on the concentration and release rate of the effluent. The type of reactor design (e.g., tokamak, mirror, etc.) has minimal influence on activation product releases. Activation products released are influenced primarily by the materials chosen for structural components, and the quantities released are influenced primarily by the coolant choice.

38923 **Hydrogen recycling properties of graphite.** Wilson, K.L.; Hsu, W.L. (Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

A review is presented on the hydrogen recycle properties of graphite, the leading, candidate material for plasma interactive component surfaces. The hydrogen transport database and modelling are summarized, followed by a discussion of its recycling properties in operating devices and its predicted tritium retention behavior in future D-T reactors.

38924 **Plasma-driven permeation of deuterium in nickel.** Causey, R.A.; Baskes, M.I. (Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The Tritium Plasma Experiment has been used to measure the temperature dependence of the plasma-driven permeation of 100 eV deuterium through nickel. Experiments were performed over the temperature range 473 K to 773 K with fluxes on the order of $3 \times 10^{16} Dcm^{2}$-s. In contrast to other recently reported data for hydrogen isotopes in nickel, the permeation rate agreed with that expected from the Baskes model for the surface recombination rate coefficient. The validity of this model is discussed. In-situ surface analysis by Auger electron spectrometry was used to measure the surface contamination during the plasma exposure. Measurements for two samples with different amounts of carbon on the surface gave similar permeation rates, suggesting that surface carbon does

not significantly affect the deuterium surface recombination rate for nickel.

38925 Influence of displacement damage on deuterium permeation in 316 stainless steel. Doyle, B.L.; Brice, D.K. (Sandia National Labs., Albuquerque, NM (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

A new permeation system for in situ measurements of the effect of radiation damage on both gas and plasma-driven hydrogen permeation through metal foils has been developed. The source of displacement damage was a beam of 16 MeV carbon ions whose range was significantly greater than the 4 μm foil thickness. Initial ion-driven deuterium permeation results for 316 stainless steel show no evidence for radiation-enhanced effects for temperatures in the range 200-400°C and displacement damage rates of 0.5 dpaday. An upper limit for the radiation enhancement of the diffusion coefficient of 100%(dpaday) has been established. Good agreement between this data and a transport parameter calculation modified to handle gases has been obtained.

38926 Dependence of the hydrogen concentration in metals on the surface impurities. Pick, M.A. (Brookhaven National Lab., Upton, NY (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC02-76CH00016.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

In a recent paper we have shown that there is a difference in the concentration of hydrogen set up in a metal when it is exposed to a flux of atomic hydrogen as compared to the same flux of molecular hydrogen. Whereas in the case of molecular hydrogen one reaches an equilibrium situation in which the resulting concentration is a bulk property given by Sievert's law totally independent of the condition of the surface, in the case of an atomic flux the resulting steady state concentration becomes a surface dependent property governed to a large extent by the condition of the surface and the resulting surface potentials. In this paper I extend the model to the more realistic case of energetic hydrogen atoms which are implanted into the metal and discuss the consequences. Furthermore, I compare the interaction of the plasma with metals to electrolytic hydrogen charging and point out the similarities. Also in this case, due to surface impurity layers, one obtains high concentrations of hydrogen.

38927 Surface-limited release of deuterium from iron. Wampler, W.R. (Sandia National Labs., Albuquerque, NM (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The release of deuterium (D) from solution in iron was measured for conditions approaching a bare-metal surface on single crystal and polycrystalline samples sputter-cleaned in UHV. The release rate was found to be proportional to the square of the concentration of D in solution. The second-order kinetics show the release is limited by molecular recombination of D on the surface. The recombination coefficient (K) measured for clean surfaces can be described by K = K_o exp(Q/sub K/kT) with K_o = 10^{-21} cm^4s and Q/sub K/ = (0.69+-0.06) eV. These recombination coefficients are orders of magnitude larger than those previously reported for iron. A model for K is presented in which the rate limiting step is the recombination and desorption of D chemisorbed on the surface and which agrees closely with the measured values. Controlled dosing of the samples with oxygen showed that submonolayer oxygen coverages cause large reductions in the D release rate.

38928 Trapping of deuterium in oxygen-implanted aluminum. Myers, S.M.; Follstaedt, D.M. (Sandia National Labs., Albuquerque, NM (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Temperature-ramp experiments employing nuclear-reaction analysis have shown that deuterium (D) is strongly trapped by Al_2O_3 precipitates in O-implanted Al. Binding enthalpies of approximately 0.7 and 1.2 eV relative to the solution site were obtained for the oxide-associated traps, as compared to 0.5 eV for defect traps within the metal matrix. The 0.7 eV trapping is hypothesized to result from the formation of D_2 molecules at the oxide boundaries and possibly within the oxides, whereas the 1.2 eV interaction is tentatively attributed to O-D bonding. Strong trapping of hydrogen isotopes by oxides within Al and possibly other metals has significant implications for plasma-materials interaction in fusion reactors.

38929 Calculated particle inventories in the TFTR moveable limiter and first wall. Heifetz, D.B.; Dylla, H.F.; Baskes, M.I.; Ulrickson, M. (Princeton Univ., NJ (USA). Plasma Physics Lab.; Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC02-76CH03073.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

A model for the time evolution of the particle inventories within the device components of TFTR has been developed. The DIFFUSE code is used to calculate the one-dimensional diffusion and trapping of particles in the wall and limiters. The DEGAS neutral transport code computes the charge-exchange fluxes onto these components. This combined model will be useful in determining the concentrations of isotopes in the device components, overall pumping by the wall and limiter during discharges, degassing rates between discharges, and the rate of isotope exchange in the machine. Example results for a 1.4 MA, 80 cm, ohmically heated discharge shaped by the TFTR moveable limiter are given. One preliminary finding was that the hydrogen inventory in the wall is comparable to that in the limiter. A bound on the diffusivity of hydrogen in graphite was also suggested by these calculations. Pumping of this discharge by the Zr/Al getter system was also simulated, and was found to be negligible.

38930 Dynamical calculation of low energy hydrogen reemission off hydrogen covered surfaces. Baskes, M.I.; Foiles, S.M.; Melius, C.F. (Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The reemission of low energy (< 100 eV) hydrogen is a critical issue on plasma/first wall recycling. Previous molecular dynamics calculations, using the Embedded Atom Method (EAM), showed a decreasing reflection coefficient at energies below 10 eV for clean nickel surfaces with no surface defects. These calculations have been extended to investigate the influence of chemisorbed hydrogen atoms on the reemission coefficient for typical fusion operating conditions. A hybrid EAM method has been developed to include molecular hydrogen formation. The results of these calculations indicate that, in addition to atomic reflection and atomic penetration into the bulk which occur on a clean surface, hydrogen atom induced atomic and molecular desorption can compete, thereby affecting the reemission coefficient. The results are dependent on the incident hydrogen energy as well as surface coverage.

38931 Permeation of deuterium implanted into V-15Cr-5Ti. Anderl, R.A.; Longhurst, G.R.; Struttmann, D.A. (Idaho National Engineering Lab., Idaho Falls (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC07-76ID01570.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Permeation and reemission of deuterium for the vanadium alloy, V-15Cr-5Ti, was investigated using 3 keV, D_3^+ ion beams from a small accelerator. The experiments consisted of measure-

ment of the deuterium reemission and permeation rates as a function of implantation fluence for 0.5 mm thick specimens heated to temperatures from 623 K to 823 K. Implantation-side surface characterization was made by simultaneous measurements of sputtered ions with a secondary ion mass spectrometer (SIMS). For the experimental conditions used, the steady-state deuterium permeation flux in V-15Cr-5Ti is approximately 18% of the implantation flux. This is approximately 1000 times that seen in the austenitic stainless steel, PCA, and 200 times that seen in the ferritic steel, HT-9, under comparable conditions. Measurement of deuterium diffusivity in V-15Cr-5Ti using permeation break-through times indicates that $D = 1.4 \times 10^{-8} \exp(-0.11 \text{ eV}kT)(m^2/s)$, over the temperature range 723 K to 823 K.

38932 Residual effects of chromium gettering on the outgassing behavior of a stainless steel vacuum vessel. Simpkins, J.E.; Blanchard, W.R.; Dylla, H.F.; LaMarche, P.H. (Oak Ridge National Lab., TN (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC02-76CH03073;AC05-84OR21400.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Long-lasting beneficial effects on plasmas after chromium gettering have been observed in ISX and TFTR. These benefits include a reduction in radiated power, lower Z/sub eff/, and the capability to operate at higher densities. This paper reports laboratory experiments performed to further investigate the underlying mechanism for this enhanced plasma performance. A stainless steel vacuum vessel and a chromium sublimation source were assembled to simulate the arrangement in TFTR. A controlled air leak was introduced, and the residual gases were monitored by a quadrupole mass spectrometer before, during, and after the deposition of a chromium film that covered 50% of the vacuum wall. The pumping speed of the film and the amount of gas sorbed as functions of time have been measured. Rate-of-rise measurements were made before deposition and after saturation of the film with oxygen. The results indicate that the residual effects of the chromium film on the vacuum are due to reduced outgassing of the stainless steel surface.

38933 Hydrogen and deuterium in graphite limiters from TFTR, PDX and PLT. Wampler, W.R.; Doyle, B.L.; Pontau, A.E. (Sandia National Labs., Albuquerque, NM (USA); Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Retention of hydrogen isotopes in graphite limiters impacts plasma fueling, isotope changeover rates and tritium inventory in fusion reactors. This paper describes measurements of the amount of deuterium (D) in graphite tiles from the TFTR limiter, and in graphite limiters from PDX and PLT, after extended exposure to high power D plasmas. D concentrations decreased abruptly over the first micron and fell to the bulk value of 4 to 13 atomic ppm beyond 40 microns from the exposed surface. The average near-surface areal densities of D on the TFTR tiles was 10^{17} Dcm^2. The total amount of near-surface D in TFTR limiters estimated using this value is larger than the amount of D in a plasma but small compared to the allowed tritium inventory. The D concentrations found in the bulk are large enough to be an important factor for tritium inventory. The 1 at.% of hydrogen (H) found in the limiters and in graphite not exposed to plasma may be an important source of hydrogen to the plasma. We discuss the influence of the H and D concentrations found in the bulk of graphite on tritium inventory estimates and hydrogen isotope changeover rates.

38934 Local mixing model with sputtering/redeposition and projectile-implanted atom interaction. Brice, D.K.; Wampler, W.R. (Sandia National Labs., Albuquerque, NM (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

A previously discussed local mixing model (LMM) accurately describes the buildup of implanted hydrogen to saturation concentration and subsequent isotope exchange for implantation into a variety of materials of interest to the fusion community. Sputtering and surface deposition were not initially included in this model. We have now incorporated into the LMM the effects of sputtering and target-atom redepostion and have also included (in an approximate fashion) the slowing and scattering of implanted ions by previously implanted impurity species. This latter effect has important consequences for high fluence implants. Equations are derived which govern the evolution of the depth profiles of the implanted species and a formal solution is given for conditions which often are encountered in laboratory experiments. The time (fluence) dependence of the depth profile is discussed, and numerical results are compared with experiment for oxygen implantation into graphite at energies for which surface erosion is a significant effect. Solutions to the equations are also discussed for cases in which surface redeposition is significant. These latter solutions are pertinent to impurity and hydrogen isotope buildup in first wall components in operating fusion reactors.

38935 Sputtering/redeposition analysis of alkali-based tungsten composites for limiter/divertor applications. DeWald, A.B.; Brooks, J.N.; Krauss, A.R.; Gruen, D.M.; Valentine, M.G. (Corium Industries, Inc., Atlanta, GA (USA); Argonne National Lab., IL (USA); Georgia Inst. of Tech., Atlanta (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract W-31-109-ENG-38.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Composites of porous tungsten infiltrated with alkali metal-bearing alloys have been projected as a means of reducing plasma impurities and sputter erosion in magnetic fusion devices. Self-sustaining alkali metal overlayers have been observed to inhibit erosion of the underlying structural substrate by 2x to 10x. The alkali metal itself, insofar as it sputters as a secondary ion, is trapped at the surface by sheath potential and tangential magnetic fields. Self-regeneration of the alkali metal coating is obtained by thermal and radiation-induced segregation from the bulk. The sputtering and redeposition properties of several tungsten-based composites are analyzed for limiter and divertor plasma regimes in comparison to pure tungsten, Composites consisting of 20% to 80% porous tungsten infiltrated with binary alloys of Cu, Al, or Si and with alkali metal solutes have been identified for their high-temperature strength, high thermal conductivity, melt layer stability, and alkali metal replenishment characteristics. Is has been found that plasma edge temperatures in excess of 200 eV may be obtainable for a number of tungsten composites in contrast to pure tungsten for which the plasma edge temperature must be kept $\lesssim$ 50 eV to minimize plasma impurities and suppress runaway self-sputtering. In addition, the constraint of a low-Z surface in contact with the plasma may be unnecessary since for a given overlayer density, high-Z alkali metal overlayers are shown to reduce the substrate sputter erosion more efficiently than low-Z alkali metal overlayers.

38936 High plasma-flux elevated temperature sputtering of Cu-Li alloys. Krauss, A.R.; Gruen, D.M.; Mendelsohn, M.H.; Conn, R.W.; Goebel, D.M.; Hirooka, Y.; Leung, W.K. (Argonne National Lab., IL (USA); California Univ., Los Angeles (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Copper-lithium alloys ranging in composition from 3-12 at.% Li have been exposed to sputtering by 3×10^{16}-6×10^{17} 100 eV He^+ cm^2 s at temperatures of 300-500°C at the UCLA PISCES plasma service. Weight loss and optical spectroscopy techniques were used to determine the sputtering-induced erosion of the binary alloys relative to pure copper. It was found that the weight loss of the alloy and the amount of copper in the plasma as measured by emission spectroscopy in some cases was reduced by a factor of five or more. Post-irradiation analysis by Auger electron spectroscopy and scanning electron microscopy show a correlation between

lithium surface depletion, surface roughening, weight loss and partial erosion yields as measured by plasma emission spectroscopy. The results are explained in terms of formation of a lithium overlayer as a result of the elevated temperature and plasma ion bombardment. The formation of the overlayer is diffusion limited and depends on the sample conditioning, sample temperature, lithium concentration, method of preparation and plasma flux. The degree to which the copper erosion is reduced depends on the Li overlayer thickness, which is expected to depend on the sputtering yield of lithium on a copper substrate, the ion fraction of the sputtered lithium, the extent of subsurface lithium depletion and the duty cycle of the plasma device.

38937 Study of the vapor produced by intense energy deposition to materials. Croessmann, C.D.; Whitley, J.B.; Kulcinski, G.L. (Sandia National Labs., Albuquerque, NM (USA). Fusion Technology Div.; Wisconsin Univ., Madison (USA). Fusion Technology Inst.). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The power radiation and vapor formation due to intense energy deposition to materials was studied. Samples of molybdenum were subjected to series of 700 ms pulses from a 25 keV electron beam with energy fluxes of 8, 10, and 12 kWcm^{-2}. The power radiated by the subsequent vapor cloud was measured as a function of time and position with a broad band pyroelectric detector which revealed a constant radiation profile across the entire sample. To study the cloud formation, aluminum shrouds were positioned over samples of SS 304, Cu, graphite, and other materials of interest. Electron microprobe analysis of the films deposited on the shrouds after intense energy deposition to the samples showed that the vapor was anisotropically released from the sample to form a cloud directly between the condensed phases and the heat source.

38938 Collector probe measurements of deuterium and impurity fluxes in the ZT-40M reversed-field pinch. Bastasz, R.; Cayton, T.E. (Sandia National Labs., Livermore, CA (USA); Los Alamos National Lab., NM (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The edge plasma and impurity content of the ZT-40M reversed-field pinch during operation without limiters are characterized using silicon collector probes. After exposure to a number of deuterium discharges, analysis of the probe samples yields information about both the ion temperature and the impurity flux. Deuterium retention and depth profile measurements show that the charge-exchange outflux from ZT-40M consists of two components: A large 50 eV component and a smaller, energetic component corresponding to an ion temperature of ≈ 400 eV. Measured deposits of nickel, chromium, iron, and molybdenum atoms, which are the main constituents of the Inconel 625 liner, indicate that the flux of metal atoms is 1-2% of the total deuterium outflux.

38939 Impurity deposition on ALT-1 limiter heads. McGrath, R.T.; Doyle, B.L.; Pontau, A.E.; Thomas, G.J.; brooks, J.N. (Sandia National Labs., Albuquerque, NM (USA); Sandia National Labs., Livermore, CA (USA); Argonne National Lab., IL (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Detailed spatial profiles of impurities deposited on the surface of the ALT-I pumped limiter heads used in TEXTOR have been measured using proton induced X-ray emission in the external ion beam analysis system. The TiC coated, ATJ graphite ALT-I limiter head was analyzed after each of two plasma exposure periods. Measurements were also made on the uncoated ATJ limiter head. For limiter operation at plasma radii ranging from 40 to 46 cm we find large accumulations of metal impurities on the ion and electron sides of the limiter. The composition implies that the source of these impurities is predominantly the stainless steel main limiters in TEXTOR. Surface concentrations of iron as high as 10^{19}cm^{-2} have been measured. On each of the limiter front faces a relative maximum in metal concentration occurs near the tangency point and relative minima are found near the toroidal extremities. An analysis of impurity transport in the edge region of TEXTOR using Redep is also presented. The calculations predict impurity atom migration patterns that strongly resemble the measured metal atom deposition profiles. The analysis provides considerable insight into impurity transport in the tokamak edge. Benchmark calculations of this type are valuable for the design of future limiter or divertor systems.

38940 TFTR-conditioned graphite: Laboratory testing of properties affecting tokamak operations. Pontau, A.E.; Causey, R.A.; Bohdansky, J. (Sandia National Labs., Livermore, CA (USA); Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The near-surface region of graphite limiters exposed to tokamak plasmas is significantly altered during discharges. In this study, we examine two 1984/85 TFTR movable limiter tiles exposed to approximately 2700 high power discharges. We find some properties of the TFTR-produced materials to be different from those of graphite. Deuterium sputtering weight loss can be characterized by carbon erosion in some areas and carbon plus metal erosion in others. Metallic impurities reduce the amount of methane produced during chemical sputtering. Adsorption and subsequent thermal desorption of light impurities by tile materials can be greater than that of non-TFTR-exposed graphite, with variations probably caused by surface area differences. Tritium uptake from a plasma is greater for the tile material. The magnitude and some of the implications of these effects on tokamak operation are discussed.

38941 Density drift in Textor with a graphite pumped limiter. Thomas, G.J.; Campbell, G.A.; Conn, R.W.; Goebel, D.W.; Dippel, K.H.; Finken, K.H. (Sandia National Labs., Livermore, CA (USA); California Univ., Los Angeles (USA); Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Plasmaphysik). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

A significant material related effect on plasma density has been observed during ALT-I pumped limiter experiments in the Textor tokamak. In previous experiments, Textor was shown to have stable and reproducible discharges. However, during recent operation with a graphite pumped limiter head, the plasma density was observed to drift continuously down toward lower values in successive discharges even though all other plasma parameters (e.g., fueling) were held constant. This effect was found to be reproducible and independent of wall conditions, occuring with high power loading of the limiter head. It is believed that the decreasing plasma density is the result of changing recycling properties of the graphite limiter caused by the temperature excursion during each discharge.

38942 Two-dimensional impurity transport calculations for a high recycling divertor. Brooks, J.N. (Argonne National Lab., IL (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—).

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Two dimensional analysis of impurity transport in a high recycling divertor shows asymmetric particle fluxes to the divertor plate, low helium pumping efficiency, and high scrapeoff zone shielding for sputtered impurities.

38943 Consequences of resistive disruptions on vacuum vessel components. Merrill, B.J.; Jardin, S.C. (Idaho National Engineering Lab., Idaho Falls (USA); Princeton Univ., NJ (USA). Plasma Physics Lab.). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC07-76ID01570.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

A computer code, DSTAR, has recently been developed to quantitify the surface erosion and induced forces that can occur during major tokamak plasma disruptions. A disruption analysis has been performed with DSTAR for the Tokamak Fusion Core Experiment (TFCX) device. The limiters and inboard first wall were assumed to be clad with beryllium. Disruption simulations were performed with and without these structures present, to determine their electromagnetic influence. The conclusion is drawn that disruption simulations that do not include both the thermal and electromagnetic response of the vacuum vessel will not result in an accurate erosion prediction.

38944 Erosion and redeposition experiments in the PISCES facility. Goebel, D.M.; Hirooka, Y.; Conn, R.W.; Leung, W.K.; Campbell, G.A.; Bohdansky, J.; Wilson, K.L.; Bauer, W.; Causey, R.A.; Pontau, A.E. (California Univ., Los Angeles (USA). Center for Fusion Physics and Engineering; Max-Planck-Institut fuer Plasmaphysik, Garching (Germany, F.R.); Sandia National Labs., Livermore, CA (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AS03-84ER52104;AC04-76DP00789.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

The modification of surfaces during exposure to plasma bombardment is a critical issue in the development of limiter and wall materials for fusion confinement experiments. Controlled studies of the erosion and redeposition of materials during high flux and fluence plasma exposure are now possible in the PISCES facility. PISCES is a continuously operating plasma device which has achieved hydrogen plasma densities of over 10^{13} cm^{-3} and electron temperatures of 5 to 24 eV over large areas. Ion fluxes of 10^{17} to 10^{19} cm^{-2} s^{-1} and fluences of up to 10^{23} cm^{-2} have been used to bombard biased samples inserted into the plasma. The plasma parameters can be selected to produce simple sputtering, or redeposition by the ionization and recycling of the sputtered target materials. Collaborative studies on the performance of Cu and Cu-Li alloys (with ANL), stainless steel (with SNLL), and graphite (with IPP at Garching, and SNLL) have been undertaken. Surface topography modification is always observed after a sufficient fluence is achieved. The net erosion rate is significantly lower during redeposition than one would expect from classical sputtering yields. The transport and deposition of different materials by the plasma to the samples during redeposition conditions results in greatly modified surface composition and morphology. Chemical sputtering of graphite during low energy, high flux ($> 10^{18}$ cm^{-2} s^{-1}) plasma bombardment is observed. Chemically formed hydrocarbons are relatively easily redeposited compared to sputtered carbon. The performance of these materials, the surface morphology evolution, and the characteristics of the redeposited materials are discussed.

38945 Pump limiter studies on the Heliotron-E device. Hillis, D.L.; Mioduszewski, P.K.; Zuhr, R.A.; Clausing, R.E.; Baity, F.W.; Fowler, R.H.; Rome, J.A.; Motojima, O.; Mizuuchi, T.; Mutoh, T. (Oak Ridge National Lab., TN (USA)). *Journal of Nuclear Materials;* **145-147**: vp(Feb 1987). (CONF-860522—). Contract AC05-84OR21400.

From 7. international conference on plasma surface interactions in controlled fusion devices; Princeton, NJ, USA (5 May 1986).

Particle control with pump limiters has been successfully demonstrated in a variety to tokamaks. This experiment has obtained, for the first time, experimental data on pump limiter operation in a heliotron configuration. A movable pump limiter module was installed on a horizontal midplane port of Heliotron-E. The limiter module was installed on a horizontal midplane port of Heliotron-E. The limiter assembly consists of a TiC-coated graphite head with single-sided particle collection and active pumping. The location of the limiter is varied from near the vacuum vessel wall or up to 8 cm inside the last closed magnetic flux surface. This flexibility permits the study of a heliotron plasma that is limited either by the magnetic separatrix or by a material limiter. In the configuration investigated, only very low pressures are observed in the pump limiter when it is located outside the last closed flux surface, indicating that the scrape-off layer density is very low ($< 5x10^{11}$ cm^{-3}). For limiter positions inside the last closed flux surface, pressures of 2-6 mTorr are observed (similar to comparable tokamak operation). Erosion patterns on the vacuum vessel, as well as hot spots on the limiter head, indicate that the particle flow out of the confined plasma exhibits complicated patterns. This suggests that for efficient particle collection in a stellarator, pump limiters must be matched to the particle flow patterns.

38946 Testing electrical insulation of LCT coils and instrumentation. Luton, J.N.; Ulbricht, A.R.; Ellis, J.F.; Shen, S.S.; Wilson, C.T.; Okuno, K.; Siewerdt, L.O.; Wuechner, F.; Zahn, G.R.; Zichy, J.A. (Oak Ridge National Lab., P.O. Box Y, Bldg. 9204-1, MS-14, Oak Ridge, TN 37831 (US)). pp 1741-1748 of Fusion technology 1986. Elmsford, NY; Pergamon Books Inc. (1987). (CONF-860917—). Contract AC05-84OR21400.

From 14. SOFT - symposium on fusion technology; Avignon, France (8 Sep 1986).

Three of the superconducting test coils in the Large Coil Task (LCT) use conductors cooled internally by forced flow of helium. In the other three coils, the conductors are cooled externally by a bath of helium. The coils and facility are designed for rapid discharges (dumps) at voltages up to 2.5 kV, depending on coil design. Many coil sensors are connected electrically to the conductors. These sensor leads and signal conditioning equipment also experience high voltage. High-potential tests of ground insulation were performed on all components of the International Fusion Superconducting Magnet Test Facility (IFSMTF0). Coil insulation was also tested by ring-down tests that produced voltage distributions within the coils like those occurring during rapid discharge. Methods were developed to localize problem areas and to eliminate them. The effect on breakdown voltage near the Paschen minimum of magnetic fields up to 2 T was investigated.

38947 Response of superconducting coils to internal heating. Okuno, K.; Mukai, H.; Lubell, M.S.; Shen, S.S.; Jakob, B.; Zichy, J.A.; Wuechner, F. (Oak Ridge National Lab., P.O. Box Y, Bldg. 9204-1, MS-14, Oak Ridge, TN 37831 (US)). pp 1733-1740 of Fusion technology 1986. Elmsford, NY; Pergamon Books Inc. (1987). (CONF-860917—). Contract AC05-84OR21400.

From 14. SOFT - symposium on fusion technology; Avignon, France (8 Sep 1986).

Development testing of six different superconducting toroidal field coils from four countries in the Large Coil Task has included investigation of each coil's tolerance for various forms of heating, such as may be encountered in the magnets of a fusion reactor. Embedded heaters and temperature and voltage sensors in the coils were used in stability tests, simulated nuclear heating tests, and measurements of current-sharing temperature at high fields and currents. Results were gratifying and promise to be useful in design of magnets for reactors.

38948 Experimental tests of a large noncircular RFP. Sarff, J.S.; Almagri, A.F.; Assadi, S.; Dexter, R.N.; Prager, S.C.; Sprott, J.C. (Univ. of Wisconsin, Madison, WI (US)). pp 107-108 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—).

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

Within a large noncircular conducting shell, originally that of the Wisconsin Levitated Octupole, the authors have examined reversed-field-pinch (RFP) plasmas in order to (1) investigate plasma control aspects of a large RFP (R=1.4 m, average minor radius=0.5 m), (2) establish that an RFP with noncircular boundary can be sustained by dynamo activity, (3) examine the effect of poloidal magnetic field curvature on RFP stability (the shell con-

tains a 35% indentation at the midplane), and (4) investigate the possibility of obtaining sustained RFP plasmas in a poloidal divertor configuration. The device is unconventional in that the 5 cm thick aluminum vacuum steel vessel with single poloidal and toroidal gaps serves as both the vacuum liner and conducting shell. The poloidal gap is protected with a 20 cm wide ceramic strip and self-reversed RFP plasmas are initiated with a toroidal loop voltage of —200 volts/turn. The best plasmas have peak currents of 300 kA and are sustained 10 msec (over ten resistive diffusion times). The conductivity temperature is —20 eV while the impurity carbon doppler width temperature is —60 eV. Unlike typical RFP experiments, no reduction in fluctuation level accompanies the toroidal field-reversal.

38949 Measurement of viscous drag on a high velocity plasma armature. Parker, J.V. (Los Alamos National Lab., Los Alamos, NM 87545 (US)). pp 108 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—).

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

Viscous drag forces strongly influence the motion of railgun plasma armatures at high velocity. Computer modeling of railgun experiments indicates that viscous drag, acting either directly on the armature or directly on a restrike plasma, is the main obstacle to reaching velocities over 10 kms. Experimental measurements of viscous drag are difficult to perform due to the complex behavior of railgun plasma armatures and the high cost of performing high velocity railgun tests. To overcome these limitations a "free-arc" technique has been developed. The "free-arc" technique utilitizes a conventional railgun apparatus with the projectile replaced by a low pressure gas. The gas is required to obtain a well defined plasma region. With the proper choice of gas pressure and driving current, only a small fraction of the magnetic force is needed to expel the initial gas fill. A series of "free-arc" experiments have been performed using the MIDI-2 railgun at Los Alamos. MIDI-2 is a small, low-current device intended mainly for materials investigations. It has a 9.5 x 9.5 mm^2 square bore, a useful length of 1.65 m and a peak operating current of 150 kA. In the "free-arc" mode a plasma velocity of 10-12 kms can be achieved routinely at 100 kA current.

38950 Acceleration to hypervelocities using minimum energy concepts. Marklin, G. (Los Alamos National Lab. (US)). pp 110-111 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—).

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

Recent experiments at Los Alamos National Laboratory (LANL) and elsewhere have demonstrated that the gross behavior of magnetized plasma containing helicity (linked magnetic fluxes) can be accurately predicted by the "Taylor Minimum Energy Principle" state which has the minimum magnetic energy possible for a given amount of helicity. This minimum energy configurations or "Taylor State" is described by the eigenvalue equation dell x B-vector = λB-vector where λ eigenvalue. The structure of the magnetic field is thus completely determined by the geometry of the container (i.e., the boundary conditions). A study of solutions to this equation for different geometries shows that there exist configurations where small changes in the geometry of a container can lead to large changes in the spatial distribution of magnetic energy with in the container. In particular, it is actually possible to have a situation where magnetic energy can be built up on a long time scale in one region and then switched into another region with a much smaller volume on a very short time scale, thus giving both energy and power compression. Experiments have begun at Los Alamos to demonstrate this process and to investigate its use in accelerating projectiles to hypervelocity. This poster describes calculations using the minimum energy principle to illustrate how this switching process works and to calculate how projectiles are accelerated in the Los Alamos experiment.

38951 Numerical modeling of the plasma ring acceleration experiment. Eddleman, J.L.; Hammer, J.H.; Hartman, C.W. (Lawrence Livermore National Lab. (US)). pp 106-107 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—). Contract W-7405-ENG-48.

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

Modeling of the LLNL RACE experiment and its many applications has necessitated the development and use of a wide array of computational tools. The two-dimensional MHD code, HAM, has been used to model the formation of a compact torus plasma ring in a magnetized coaxial gun and its subsequent acceleration by an additional applied toroidal field. Features included in the 2-D calculations are self-consistent models for (1) the time-dependent poloidal field produced by a capacitor bank discharge through a solenoid field coil (located either inside the gun inner electrode or outside the outer gun electrode) and the associated diffusion of magnetic flux through neighboring conductors, (2) gas flow into the gun annular region from a simulated puffed gas valve plenum, (3) formation and motion of a current sheet produced by J x B forces resulting from discharge of the gun capacitor bank through the plasma load between the coaxial gun electrodes, (4) the subsequent stretching and reconnection of the poloidal field lines to form a compact torus plasma ring, and (5) finally the discharge of the accelerator capacitor bank producing an additional toroidal field for acceleration of the plasma ring. The code has been extended to include various models for gas breakdown, plasma anomalous resistivity, and mass entrainment from ablation of electrode material.

38952 High density Z pinch formed from a solid deuterium fiber. Hammel, J.E.; Scudder, D.W. (Los Alamos National Lab. (US)). pp 107 of The 1987 IEEE international conference on plasma science (Abstracts). Piscataway, NJ; IEEE Service Center (1987). (CONF-870651—).

From IEEE international conference on plasma science; Crystal City, VA, USA (1 Jun 1987).

A Z pinch formed from a fiber of solid deuterium has been operating in Los Alamos since August 1985. The ultimate goal of these experiments is the achievement of a deuterium plasma temperature of 10 keV in an ohmically heated equilibrium pinch stable for several Lawson times. Out approach is to form the pinch from a small diameter solid deuterium fiber and provide a current rise rate which will maintain radial pressure equilibrium, thereby avoiding the violent implosion of classical Z pinches and gas-puff pinches. Solid deuterium fibers with diameters between 20 μm and 40 μm are produced with a cryogenic extruder developed at Los Alamos. A 40 μm fiber would produce an equilibrium temperature > 10 keV at the Pease- Braginski current of 1.4 MA. The experiment now operating provides a plasma current of 250 kA with a 120 ns risetime from a 600 kV Marx banktransmission line current generator with an impedance of 1.5Ω. A well-behaved channel is routinely achieved with plasma temperatures > 300 eV at a density of 2 x 10^{21} cm^{-3} at 250 kA. The plasma characteristics are determined from multifrance schlieren photography, soft x-ray diodes, x-ray pinhole photographs and both time-integrated and time-resolved neutron detectors. The multiframe schlieren photographs taken at 10 ns intervals show a straight uniform channel in Bennett equilibrium for at least 60 ns. m = 0 features are seen at late times while m= 1 is not observed. Stable time is > 60 sound transit times. The neutron number is in reasonable agreement with the x-ray data.

38953 (CONF-8805103—2) Public alert and warning systems for chemical plant emergencies. Sorensen, J.; Rogers, G.; Fisher, D. (Oak Ridge National Lab., TN (USA); Federal Emergency Management Agency, Washington, DC (USA)). 1988. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011007/JAW.

From Hazardous material spills conference; Chicago, IL, USA (16 May 1988).

This paper assesses public warning systems for fixed-site chemical facilities. Based on data collected in 137 communities, current warning systems, except in a few cases, lag behind what can be defined as state-of-the-art practices. The current systems will likely be adequate for slowly developing events, but would fail to provide timely warning in a rapid release situation.

38954 **(EUR—10815-DE) Selected EC patents.** (Commission of the European Communities, Luxembourg. Directorate General Telecommunications, Information Industries and Innovation). 1986. 378p. (In German). Commission of the European Communities, Luxembourg. Office for Official Publications of the European Communities.

The activities of the EC Commission on the patent sector are illustrated by a selection of EC research findings for which patents were granted. With 67 figs., 7 tabs.

38955 **(ORAU—88/A-73) Technical training: Challenge in a changing environment.** (Oak Ridge Associated Universities, Inc., TN (USA)). Feb 1988. Contract AC05-76OR00033. 121p. (CONF-8710184—). NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88009043/JAW.

From 11. annual Training Resources and Data Exchanges (TRADE) conference; Atlanta, GA, USA (26 Oct 1987).

Purpose is to facilitate contractor-to-contractor exchange of training program information and resources as a means to improve the quality of training at all US DOE facilities. Thirteen papers are included, with emphasis on radiation protection, hazardous materials, and good instruction. (DLC)

38956 **(SAND—87-2276) A method for reducing the coning of a spinning vehicle.** Criel, T.M.; Cole, J.K.; Wyatt, F.V. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 24p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010971/JAW.

A technique for deconing a vehicle is described that involves only a single accelerometer or rate gyro, a thruster, and an electronic control unit. The testing of this technique is reviewed, and variations of the technique that can reduce the propellant required to decone are considered. A brief discussion of the dynamics of vehicles that are coning in space is also included to introduce the concept of deconing.

38957 **(SAND—88-0573C) Exterior field evaluation of new generation video motion detection systems.** Malone, T.P. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 10p. (CONF-880631—11). NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011919/JAW.

From 29. annual meeting of the Institute of Nuclear Materials Management; Las Vegas, NV, USA (26 Jun 1988).

Recent advancements in video motion detection (VMD) system design and technology have resulted in several new commercial VMD systems. Considerable interest in the new VMD systems has been generated because the systems are advertised to work effectively in exterior applications. Previous VMD systems, when used in an exterior environment, tended to have very high nuisance alarm rates due to weather conditions, wildlife activity and lighting variations. The new VMD systems advertise more advanced processing of the incoming video signal which is aimed at rejecting exterior environment nuisance alarm sources while maintaining a high detection capability. This paper discusses the results of field testing, in an exterior environment, of two new VMD systems. The field tests were conducted in a video/sensor test bed area with double fenced perimeter security type zones. Testing included detection capability evaluation of human targets crossing the perimeter zones and nuisance alarm data gathering. The testing was conducting in order to characterize each of the VMD system's performance in a particular exterior environment. Test results reveal some of the strengths and weaknesses of each system for the conditions tested, and some site considerations if a VMD system is being considered for exterior use.

9901 Management

38958 **(CONF-880379—1) Productivity improvement - Resource management.** Jones, R.W. (EG and G Energy Measurements, Inc., Los Alamos, NM (USA). Los Alamos Operations). 1988. Contract AC08-88NV10617. 33p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008057/JAW.

From DOE maintenance management conference; New Orleans, LA, USA (28 Mar 1988).

Productivity improvement and resource management as it relates to productivity is discussed. Viewgraphs accompany the discussion.

38959 **(CONF-880631—5) How much quality assurance?.** Beatty, R.A.; Talboy, J.H. (Argonne National Lab., IL (USA)). 13 Apr 1988. Contract W-31109-ENG-38. 9p. (CONF-880631—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009583/JAW.

From 29. annual meeting of the Institute of Nuclear Materials Management; Las Vegas, NV, USA (26 Jun 1988).

This paper describes the approach used at Argonne National Laboratory to apply the techniques of quality assurance to research and development activities. The discussion includes the approach, the reasons that it is gaining acceptance, and its wide applicability. This approach is founded on the lessons learned in management of quality at Argonne National Laboratory over a period of more than 15 years. The discussion is confined to the practices at the Illinois site of the Laboratory where more than 3000 researchers and support personnel conduct basic and technology-directed research.

38960 **(CONF-880698—2) A knowledge-based manager for software projects.** Agarwal, A.; Jairam, B.N.; Emrich, M.L.; Murthy, N. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 7p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010436/JAW.

From 1. international conference on industrial and engineering applications of artificial intelligence and expert systems; Tullahoma, TN, USA (2 Jun 1988).

Management aspects of software development have received little research interest. The SOFTMAN system addresses the automation of this feature of the SDLC. It is a knowledge-based system which tracks the health of a software development effort. By comparing user metrics to past environment standards, anomalies in the coding stage are detected and suggestions for solving them are offered. In addition, SOFTMAN can be used to tutor new personnel, perform what-if anaylsis, and build a corporate memory regarding managment decisions. 15 refs., 2 figs.

38961 **(CONF-8804115—1) Knowledge-based cost estimating vs traditional software cost models.** Arrowood, L.F.; Emrich, M.L.; Sadlowe, A.R.; Jones, K.A.; Watson, B.D.; Surapaneni, R. (Oak Ridge National Lab., TN (USA)). 12 Apr 1988. Contract AC05-84OR21400. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009707/JAW.

From 2. annual Engineering Society of Detroit SMI expert systems 88 solutions in manufacturing conference and exhibition; Detroit, MI, USA (12 Apr 1988).

A knowledge-based system, ADP-Estimator, is under development to perform ADP project cost estimating. Designed to retain crucial expertise held by experienced project leaders, this system allows new project leaders to interactively generate cost estimates. Initially, project leaders indicate constraints (e.g. personnel levels, equipment, and facilities) placed upon a project. The system uses these to identify resources and procedures required for project completion. The efficacy of this system is compared with manual efforts and traditional software cost models.

38962 **(DOE/IG—0008/10-5) Office of Inspector General semiannual report to the Congress, October 1, 1987 to March 31, 1988.** Layton, J.C. (USDOE, Washington, DC). May 1988. 79p. H. Order Number TI88011769/JAW.

We issued 219 audit and inspection reports during this period. As a result of reviews of cost proposals and contract billings, we determined that $95.8 million in costs were either unallowable or unsupported. On reports where a final Departmental position was received, management committed to more efficient use of funds totaling $200.8 million. Our investigations of wrongdoing led to 21 referrals for prosecution, 6 convictions, 7 indictments, and 17 disciplinary actions. The investigations also resulted in the recovery for the Department of $375,180.

38963 **(DOE/MA—0338) Technical skills training program course directory.** (USDOE Assistant Secretary for Management and Administration, Washington, DC). Jun 1988. 62p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011678/JAW.

The departmentally adminstered Technical Skills Training Program encompasses three functional areas: Program Management Skills, Project Management Skills and Procurement and Assistance Skills Training. Primary emphasis is directed at providing DOE employees the specific work-related skills necessary to perform effectively and efficiently. This directory contains descriptions of the courses available in the three program areas and general information for participation in the training programs. Separate sections have been reserved for the Current Year Schedule and listings of the Headquarters and Field Trainig Office Coordinators.

38964 **(DOE/MA—0342) Analysis of benefits and costs (ABC's) guideline: Volume 1, A manager's guide to analysis of benefits and costs.** (USDOE Assistant Secretary for Management and Administration, Washington, DC. Office of ADP Management). Jun 1988. 20p. NTIS, PC A03/MF A01; GPO Dep. Order Number DE88011700/JAW.

Managers spend much of their time and effort planning for the future. These plans usually involve making decisions about how to spend scarce resources. This guideline explains a process which will aid managers in making these choices. This process, a stuctured approach to decision making, is an Analysis of Benefits and Costs (ABC). ABC's are also known as Benefit-Cost, Economic or Investment Analysis. In particular, this guideline explains the usefulness of ABC's in making choices among competing alternatives concerning Information Resource Management (IRM).

38965 **(DOE/MA—0343) Analysis of benefits and costs (ABC's) guideline: Volume 2, An analyst's handbook for analysis of benefits and costs.** (USDOE Assistant Secretary for Management and Administration, Washington, DC. Office of ADP Management). Jun 1988. 76p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88011354/JAW.

This handbook is for information technology personnel with little or no previous experience in the analysis of benefits and costs (ABC). This handbook describes the essential concepts and procedures necessary to conduct an ABC. It also explains the use of ABC's to support decisions related to information resources management (IRM). A companion volume,"A Manager's Guide to Analysis of Benefits and Costs," explains the importance of ABC's to the Department of Energy's IRM decision making.

38966 **(DOE/OR/17883—T1) Report of activities performed for the period 1 July 1986-30 June 1987.** (National Research Council, Washington, DC (USA). Numerical Data Advisory Board). 1988. Contract FG05-82TC11276;AP05-87OR17883. 31p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88006904/JAW.

This document discusses the activities of the Numerical Data Advisory Board from July 1, 1986 through June 30, 1987. (FP)

38967 **(EGG-M—00388) Mutually exclusive alternatives by clustering.** Mooney, E.; Ross, T. (EG and G Idaho, Inc., Idaho Falls (USA)). 1988. Contract AC07-76ID01570. 5p. (CONF-880591—1). NTIS, PC A02;3. Order Number DE88007707/JAW.

From Institute of Industrial Engineers meeting; Orlando, FL, USA (22 May 1988).

This paper begins with a brief introduction to cluster analysis and an overview of its application in the identification of mutually exclusive alternatives for economic analysis. The approach is then illustrated with an example, followed by some concluding remarks. The example involves maintenance of minicomputers at INEL.

38968 **(INIS-GB—139) Corporate Plan (for the National Radiological Protection Board) 1988/89 to 1992/93.** (National Radiological Protection Board, Chilton (UK)). Apr 1988. 31p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753990/JAW.

The Cabinet Office (Management and Personnel Office), when setting down guidelines, recommended that all Non-Departmental Public Bodies such as the Board should prepare Corporate Plans against which the performance of the organisation and the relevance of the activities to contemporary requirements could be better measured. To that end, the Board now prepares a Corporate Plan annually. This year's plan is for the financial period 1988/89 through to 1992/93, both years inclusive. The document indicates the broad programme areas in which the Board intends to concentrate its efforts, and the trends it expects over the planning period. The Board's overall strategy is to cover a wide range of relevant radiological protection matters, but with most emphasis on those likely to become major points of public or governmental concern in the near future. Major issues are expected to be: new estimates of the risks associated with radiation exposure and subsequent international and national recommendations on dose limitation; public exposures and aspects of radiation in the environment; and increasing awareness of non-ionising radiation. The Board is partly dependent upon receipts from its commercial activities and must, therefore, also look at the provision of services and prepare to meet the demands likely to arise in the 1990s.

38969 **(K/C—1482) Work for others program plan, FY 1988-FY 1992.** (Oak Ridge Gaseous Diffusion Plant, TN (USA)). Apr 1988. Contract AC05-84OT21400. 44p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011533/JAW.

This document is the third annual program plan that summarizes the work for others (WFO) performed by Martin Marietta Energy Systems, Inc., in Department of Energy (DOE)-Oak Ridge Operations (ORO) facilities. The period covered by this plan is FY 1988 through FY 1992. In this document, WFO is defined as work performed for non-DOE programs; it excludes work on in-house DOE programs and work for other DOE labs and contractors. Descriptions of WFO activities in eight major program areas, estimates of expected operating costs and personnel levels, and a description of the management structure and actions to integrate and control WFO activities are presented. Some examples of major recent successes in the WFO programs are also included in an appendix. The major emphasis is on work for other federal agencies (WFOFA) since those activites constitute more than 95% of the total WFO program; the remaining WFO activities are performed for state and local governments, foreign institutions, and the private sector. 6 figs., 7 tabs.

38970 **(LA-UR—88-194) New developments in capital cost estimating.** Stutz, R.A.; Zocher, M.A. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 7p. (CONF-880728—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88005392/JAW.

From 32. annual meeting of the American Association of Cost Engineers and the 10th international cost engineering congress; New York, NY, USA (10 Jul 1988).

The new developments in cost engineering revolve around the ability to capture information that in the past could not be automated. The purpose of automation is not to eliminate the expert cost engineer. The goal is to use available technology to have more information available to the professionals in the cost engineering field. In that sense, the demand for expertise increases in order to produce the highest quality estimate and project possible from all levels of cost engineers. We cannot overemphasize the importance of using a good source of expert information in building these types of programs. "Garbage in, garbage out" still applies in this form of programming. Expert systems technology will become commonplace in many vertical markets; it is important to undersand what can and cannot be accomplished in our field, and where this technology will lead us in the future.

38971 **(OEFZS-A—1058) HTR research and development in Austria.** Proksch, E.; Fritz, K.; Neumann, W. (Oesterreichisches Forschungszentrum Seibersdorf G.m.b.H.). Sep 1987. 6p. (CH—376/87; WE—442/87; RS—295/87). Austrian Research Centre Seibersdorf, A-2444 Seibersdorf (Austria).

Limited Distribution.

This report summarizes R and D work on: high-temperature reactor fuels, high-temperature structural materials, and high-temperature helium test rig/prestressed concrete pressure vessel, which was performed in Austria since the 6th Meeting of the International Working Group on Gas-Cooled Reactors of the IAEA. 8 refs.

38972 **(ORAU—88/B-2) Prescriptions for growth: A status report on U.S. Department of Energy communications with colleges land universities.** Morrison, W.D.; Rodman, J.A. (Oak Ridge Associated Universities, Inc., TN (USA)). Feb 1988. Contract AC05-76OR00033. 59p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009036/JAW.

This report presents the results of a study designed to evaluate the effectiveness of DOE communications with the nation's colleges and universities. A 1983 report of the Energy Research Advisory Board (ERAB) entitled An Assessment of the Relationship Between the Department of Energy and Universities and Colleges (the ERAB report) concluded that relationships between US Department of Energy and the academic community would be significantly enhanced by the development of effective reciprocal communication process. The ERAB report identified many communication-related issues that impact the important working relationship between DOE and acedeme. 9 figs.

38973 **(AD-A—190201/4/XAB) Approximation methods for the identification and control of distributed-parameter systems. Final technical report, 1 October 1984-30 September 1987.** Rosen, I.G. (University of Southern California, Los Angeles (USA). Dept. of Mathematics). 20 Nov 1987. 43p. NTIS, PC A03/MF A01.

Efforts to develop computational methods for the identification and optimal control of linear and nonlinear systems governed by distributed-parameter systems are reported on. Specifically, approximation methods for determining Optimal LOG compensators (feedback control and estimator gains) and functional parameters in linear and nonlinear partial differential equations and hereditary systems were developed, analyzed, and tested. The study included theoretical, experimental, and numerical components. Covergence theories for spline-based and modal finite-element schemes were established, and extensive numerical studies on both conventional (serial) and vector supercomputers were carried out. A parameter estimation scheme was tested using experimental data taken from the RPL structure, a laboratory experiment designed to test control algorithms for the large-angle slewing of spacecraft with flexible appendages, and other projects involving the identification of flexible structures based upon experimental data were initiated.

38974 **(AD-A—190236/0/XAB) Transformations of concurrent algorithms for highly parallel systems: a one-year project summary report. Final report for period ending 1 October 1987.** Gannon, D. (Indiana Univ., Bloomington (USA). Dept. of Computer Science). Oct 1987. 6p. NTIS, PC A02/MF A01.

It has become a certainty that Multiple Instruction Stream, Multiple Data Stream (MIMD) parallel architectures are going to play a major role in all aspects of high-speed computer design for the foreseeable future. What is not clear is whether we will be able to devise a means to design algorithms and software for these machines that transcends our current ad-hoc, nonportable techniques. In this project the author focused on the portability issue from the perspective of parallel-algorithm design and how it effects the internal organization of advanced compilers. The eventual goal of the project is to produce an expert system that can help users transform large, complex applications from one highly parallel machine to another. The basic strategy has been to follow the following plan: 1) Build an experimental research laboratory for parallel computation; 2) Design an experimental program of research that would shed light on the problems involved with restructuring parallel programs for different machines; 3) Attempt to provide a mathematical characterization of the properties of the machines and how algorithms must be restructured to run on them; and 4) Attempt to design a model of machine architecture that can be embedded into the inference engine or knowledge base of an expert system for program restructuring.

38975 **(AD-A—190383/0/XAB) MultiScheme: a parallel-processing system based on MIT (Massachusetts Institute of Technology) scheme. Doctoral thesis.** Miller, J.S. (Massachusetts Inst. of Tech., Cambridge (USA). Lab. for Computer Science). Sep 1987. 247p. (MIT/LCS/TR—402). NTIS, PC A11/MF A01.

MultiScheme is a fully operational parallel-programming system based upon the Scheme dialect of Lisp. Like its Lisp ancestors, MultiScheme provides a conducive environment for prototyping and testing new linguistic structures and programming methodologies. MultiScheme supports a diverse community of users who have a wide range of interests in parallel programming. MultiScheme's flexible support for system-based experiments in parallel processing has enabled it to serve as a development vehicle for university and industrial research. At the same time, MultiScheme is sufficiently robust, and supports a sufficiently wide range of parallel-processing applications, that it has become the base for a commercial product, the Butterfly Lisp System produced by BBN Advanced Computers, Inc.

38976 **(AD-A—190389/7/XAB) Synapses that compute motion. Memorandum report.** Poggio, T.; Koch, C. (Massachusetts Inst. of Tech., Cambridge (USA). Artificial Intelligence Lab.). Jun 1987. 14p. (AI-M—973). NTIS, PC A03/MF A01.

Biophysics of computation is a new field that attempts to characterize the role in information processing of the several biophysical mechanisms in neurons, synapses, and membranes that have been uncovered in recent years. This article reviews a synaptic mechanism, based on the interaction between excitation and silent inhibition, that implements a veto-like operation. Synapses of this type may underlie direction selectivity to direction of motion in the vertebrate retina.

38977 **(AD-A—190557/9/XAB) Inquiry into the benefits of multigauge parallel computation. Technical report.** Snyder, L. (Washington Univ., Seattle (USA). Dept. of Computer Science). May 1985. 7p. (TR—85-06-03). NTIS, PC A02/MF A01.

A multigauge parallel computer is a machine whose processor elements can be partitioned into distinct processors with narrower data paths; ILLIAC IV was a multigauge machine. This paper addresses the question of whether multigauge computation is useful. First, the concept is defined. Next, it is argued that multigauge machines offer truly new computational facilities, rather than being other architectures in disguise. Finally , a class of algorithms is identified that can exploit multigauge architectures and an example is presented to illustrate multigauge machine performance improvements.

38978 **(AD-A—190558/7/XAB) Playing Poker: a full programming example using the Poker environment. Technical report.** Snyder, L. (Washington Univ., Seattle (USA). Dept. of Computer Science). Sep 1985. 40p. (TR—85-09-02). NTIS, PC A03/MF A01.

This document is intended to serve as a sample program for the Poker Parallel Programming Environment. However, Poker programs do not exist in the traditional sense: there is no monolithic sequence of symbolic text. Rather, Poker keeps a source data base that the programmer can view and change using interactive graphics. Data bases and interactive graphics may be very convenient for the programmer, but they are not easily conveyed in hardcopy form. So, in an effort to provide some sense of the course of a Poker programming session, this example is intended to be as com-

prehensible as possible without requiring the reader to be fully familiar with the massive background material. The presentation is directed at two audiences: those who do not have Poker available but would like to see specific details in a form not as dry as a reference manual, and those who do have Poker available and would like a quick way to gain operational proficiency. Both audiences can learn how things are done in Poker. For an explanation of why things are done as they are, two papers, written for general audiences, are available, one on Poker and one on the CHIP architecture.

38979 (AD-A—190571/0/XAB) Modeling, simulation, and comparison of interconnection networks for parallel processing. Master's thesis. Raines, R.A. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1987. 117p. (AFIT/GCE/ENG—87D-8). NTIS, PC A06/MF A01.

This thesis extends existing modeling, analysis, and comparison of interconnection networks for parallel-processing systems. Simulation models are developed for the multistage cube network, the single-stage cube network (hypercube), and the Illiac IV mesh-type network. They are then used to provide a comparison of three classes of interconnection networks which, until now, has not been performed. These models are implemented using a commercially packaged simulation language provide for compact source code and ease of readability. The networks are modeled under a common set of operating assumptions and system environment. This allows for accurate comparisons of average network packet delays an memory requirements necessary to physically implement the chosen network at a given network operating load. It is concluded that, for the network sizes and operating conditions established, the multistage cube network performs better at a lower hardware cost than do the single-stage cube and mesh networks. As a result, the designer of a parallel-processing system is given additional insight for choosing an interconnection network which best suits the application needs.

38980 (AD-A—190578/5/XAB) Masking fields: a massively parallel neural architecture for learning, recognizing, and predicting multiple groupings of patterned data. Cohen, M.A.; Grossberg, S. (Boston Univ., MA (USA). Center for Adaptive Systems). 15 May 1987. 25p. NTIS, PC A03/MF A01.

Pub. in Applied Optics, Vol. 26, No. 10, 1866-1891(15 May 1987).

A massively parallel neural-network architecture, called a masking field, is characterized through systematic computer simulations. A masking field can simultaneously detect multiple groupings within its input patterns and assign activation weights to the codes for these groupings that are predictive with respect to the contextual information embedded within the patterns and the prior learning of the system. A masking field automatically rescales its sensitivity as the overall size of an input pattern changes, yet also remains sensitive to the microstructure within each pattern. Thus, a masking field suggests a solution of the credit assignment problem by embodying a real-time code for the predictive evidence contained within its input patterns. Such capabilities are useful in speech recognition, visual object recognition, and cognitive information processing. An absolutely stable design for a masking field is disclosed through an analysis of the computer simulations. This design suggests how associative mechanisms, cooperative-competitive interactions, and modulatory gating signals can be joined together to regulate the learning of compressed recognition codes. Data about the neural substrates of learning and memory are compared to these mechanisms.

38981 (AD-A—190631/2/XAB) Poker 3.1: a programmer's reference guide. Technical report. Snyder, L. (Washington Univ., Seattle (USA). Dept. of Computer Science). Sep 1985. 63p. (TR—85-09-03). NTIS, PC A04/MF A01.

This document gives a succinct description of the facilities available with the Poker Programming Environment. The emphasis is on what is available rather than how to achieve particular results. Poker uses interactive graphics. The usual programming language notion of a source program as a monolithic piece of symbolic text has been replaced in Poker by a data base. Object programs (the compiled data base) are emulated by Poker and snapshots of the execution can be continuously displayed. Poker supports a variety of CHiP architectures; the current one can be displayed or changed using the CHiP Parameters facility. The back page of this document gives a summary of the commands. Other versions of Poker exist; consult Appendix B for your particular system.

38982 (AD-A—190633/8/XAB) Supercomputer environment. Annual technical report, 1 October 1986-30 September 1987. (Illinois Univ., Urbana (USA)). 30 Oct 1987. 7p. NTIS, PC A02/MF A01.

This summary covers goals and first-year accomplishments of the Faust project, a research effort to develop a software-engineering environment of supercomputer application development. The goal of Faust is to provide a user-friendly work station of integrated development tools that caters to a broad range of user expertise. Faust comprises individual efforts in the area of user-interface tools, expert systems, parallel program debugging, performance evaluation, symbolic processing, error analysis, and graphics. The Faust project is additionally supporting efforts in the areas of fluid and structural dynamics. Overall project goals are outlined, followed by a summary of first contract year's accomplishments that were presented to the Faust project review team on August 6, 1987.

38983 (AD-A—190683/3/XAB) Parallel artificial-intelligence search techniques for real-time applications. Master's thesis. Shakley, D.J. (Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering). Dec 1987. 122p. (AFIT/GCS/ENG—87D-24). NTIS, PC A06/MF A01.

State-space search is an important component of many problem-solving methodologies. The computational models within Artificial Intelligence depend heavily upon state-space searches. Production systems are one such computational model. Production systems are being explored for real-time environments where timing is of a critical nature. Parallel processing of these systems and, in particular, concurrent state-space searching seems to provide a promising method to increase the performance (effective and efficient) of production systems in the real-time environment. Production systems in the form of expert systems, for example, are being used to govern the intelligent control of the Robotic Air Vehicle (RAV) which is currently a research project at the Air Force Wright Aeronautical Laboratories. Due to the nature of the RAV system, the associated expert system needs to perform in a demanding real-time environment. The use of a parallel-processing capability to support the associated computational requirement may be critical in this application. Thus, parallel search algorithms for real-time expert systems are designed, analyzed, and synthesized on the Texas Instruments (TI) Explorer and Intel Hypercube.

38984 (ANL—87-26-Vol.1) Proceedings of the focused research program on spectral theory and boundary value problems: Volume 1, Singular differential systems. Pieper, G.W. (ed.). (Argonne National Lab., IL (USA)). Dec 1987. Contract W-31109-ENG-38. 177p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88008151/JAW.

This is the first volume of a series of reports containing the proceedings of the Focused Research program on spectral theory and boundary value problems. The topics covered are: M(λ) theory for singular hamiltonian systems; M(λ)-computation for singular differential systems; Levinson's theorem and Titchmarch-Weyl M(λ) theory for Dirac systems; deficiency indices of powers of Sturm-Liouville expressions with large leading coefficient; and the Bessel-squared equation in the lim-2, lim-3, and lim-4 cases.

38985 (ANL—88-18) Research in mathematics and computer science at Argonne, July 1, 1986-January 6, 1988. Pieper, G.W. (ed.). (Argonne National Lab., IL (USA)). 1988. Contract W-31109-ENG-38. 71p. NTIS, PC A05/MF A01;1; GPO Dep. Order Number DE88010343/JAW.

This report reviews the research activities in the Mathematics and Computer Science Division at Argonne National Laboratory for the period July 1, 1986, through January 6, 1988. The body of the report gives a brief look at the MCS staff and the research facilities, and discusses various projects carried out in two major

areas of research: analytical and numerical methods and advanced computer systems concepts. Information on division staff, visitors, workshops, and seminars is found in the appendixes. 6 figs.

38986 **(ANL/MCS-TM—110) Computing small singular values of bidiagonal matrices with guaranteed high relative accuracy: LAPACK working note # 3.** Demmel, J.; Kahan, W. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 44p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008465/JAW.

Computing the singular values of a bidiagonal matrix is the final phase of the standard algorithm for the singular value decomposition of a general matrix. We present a new algorithm which computes all the singular values of a bidiagonal matrix to high relative accuracy independent of their magnitudes. In contrast, the standard algorithm for bidiagonal matrices may compute small singular values with no relative accuracy at all. Numerical experiments show that the new algorithm is comparable in speed to the standard algorithm, and frequently faster. We also show how to accurately compute tiny eigenvalues of some classes of symmetric tridiagonal matrices using the same technique. 11 refs., 4 tabs.

38987 **(ANL/TM—400-Rev.1) MVS [Multiple Virtual Storage] batch computing and data management at ANL.** Thommes, M.M.; Hinds, A.R.; Thom, D.J. (Argonne National Lab., IL (USA)). Feb 1988. Contract W-31109-ENG-38. 198p. NTIS, PC A09/MF A01;1; GPO Dep. Order Number DE88007342/JAW.

This manual describes the batch computing system running under MVS (Multiple Virtual Storage) on the IBM computers (two IBM 3033's) at Argonne National Laboratory. It serves as a guide to the Argonne MVS batch computing environment and recommends practices and modes of operation. It explains the terminology and conventions used at Argonne, describes some Job Control Language (JCL) needed to run your MVS batch jobs, and shows how to manage data files on disk and tape devices.

38988 **(ANL/TM—423-Rev.1) CMS [Conversational Monitor System] at ANL.** Gallo, M.A.; Caruthers, C.M. (Argonne National Lab., IL (USA)). Apr 1988. Contract W-31109-ENG-38. 50p. NTIS, PC A04/MF A01; GPO Dep. Order Number DE88010979/JAW.

CMS is IBM's Conversational Monitor System. It is an interactive system that runs on the red IBM 3033 computer with the operating control program (CP). Both CMS and CP are subsets of VM/SP (the Virtual Machine/System Product) operating system. Among other capabilities, CMS allows you to: create graphs and charts, send and receive electronic mail, create and run programs, format documents and memoranda (with embedded graphics), and query the Argonne telephone directory. In general, the VM/SP system and the OBS Wylbur system in MVS do not share the same disk space; however, procedures are available for transferring files between the two systems. You can also submit batch jobs created in CMS to the MVS batch system and monitor their execution. 5 tabs.

38989 **(ANL/TM—461) ANL site response for the DOE FY 1990 information technology resources long-range plan.** Boxberger, L.M.; Caruthers, C.M. (ed.). (Argonne National Lab., IL (USA)). Mar 1988. Contract W-31109-ENG-38. 233p. NTIS, PC A11/MF A01;1; GPO Dep. Order Number DE88009188/JAW.

As one of a continuing series, this Site Response is an update and extension of the Laboratory's previous submissions. The response contains both narrative and tabular material. It covers an eight-year period consisting of the base year (FY1987), the current year (FY1988), the budget year (FY1989), the plan year (FY1990), and the out years (FY1991-1994). This Site Response was compiled by Argonne National Laboratory's Computing Services organization, which has the responsibility to provide leadership in optimizing computing and information services and disseminating computer-related technologies throughout the Laboratory. The Site Response consists of four parts. Part 1: "Site Overview" describes the ANL Mission, overall organization structure, the strategic approach toward meeting information technology resource needs, the planning process, major issues, and points of contact. Part 2A: "Information Systems Plans for DOE Contractors" defines the current and planned automated information systems associated with the management of ANL, the stewardship of its resources, and the provision of day-to-day general operations and services. (Part 2B: "Information Systems Plans for DOE Organizations" and Part 2C: "FMS Plans for DOE Organizations" do not apply to Argonne National Laboratory.) Part 3: "Computing Resources Plan" defines the requirements, resources, acquisitions, and budget for computing at ANL for FY1987 through FY1994. Part 4: "Telecommunications Plan" documents the existing and planned telecommunications resources required at ANL from FY1987 through FY1994.

38990 **(BNL—39830-Rev.1) A guide to telecommunications at Brookhaven National Laboratory.** (Brookhaven National Lab., Upton, NY (USA)). Jun 1988. Contract AC02-76CH00016. 42p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011210/JAW.

38991 **(CEA-CONF—9239) Describing control.** Fouet, J.M.; Starynkevitch, B. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Etudes Mecaniques et Thermiques). 1987. 4p. (CONF-8708257—). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88753461/JAW.

From 10. international joint conference on artificial intelligence; Milan, Italy (23 Aug 1987).

Incremental development and maintenance of large systems imply that control be clearly separated from knowledge. Finding efficient control for a given class of knowledge is itself a matter of expertise, to which knowledge-based methods may and should be applied. We present here two attempts at building root systems that may later be tuned by knowledge engineers, using the semantics of each particular application. These systems are given heuristics in a declarative manner, which they use to control the application of heuristics. Eventually, some heuristics may be used to compile others (or themselves) into efficient pieces of programmed code.

38992 **(CEA-R—5420) Software for the automatic processing of alpha spectra, the Sesame code.** Pineira, T. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Protection contre les Rayonnements). Feb 1988. 46p. (In French). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88753479/JAW.

The SESAME code described in this document enables unfolding of alpha spectra by means of a simple method which can easily be implemented on a micro or minicomputer. The software is designed to unfold peaks of which the maxima are separate, but also includes provision for semi-automatic processing of peaks which are hidden or of which the energy levels are too close to be resolved by the automatic peak identification process. The method of unfolding used in the code has been chosen for the reason that it does not require any other information but the spectrum. The form of the peak is induced from the envelope of the spectrum without recourse to hypotheses concerning the shape of the peaks or to mathematical adjustments. The software has been validated and qualified, and is currently in regular use on a wide range of hardware.

38993 **(CONF-870565—Summs.) Summary of papers to be presented at the tenth computer security group conference.** (USDOE, Washington, DC). 1987. 123p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88012684/JAW.

From Department of Energy computer security group conference; Albuquerque, NM, USA (5 May 1987).

Issues surrounding the topics of computer hardware, software, and data transmission are addressed in the papers presented at this conference. Individual reports are indexed and abstracted separately. (DWL)

38994 **(CONF-871128—2) A comparative study of project estimating tools.** Jones, K.A.; Sadlowe, A.R.; Emrich, M.L.; Arrowood, L.F.; Watson, B.D.; Surapaneni, R. (Oak Ridge National Lab., TN (USA)). 1987. Contract AC05-84OR21400. 25p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88009059/JAW.

From NARDAC Washington/ORNL/DSRD conference on expert systems technology in the ADP environment; Washington, DC, USA (2 Nov 1987).

Existing project estimation software may adequately estimate programming costs associated with large software development projects. However, customizing these packages to reflect unique organizational requirements may be difficult. In addition, such systems may not offer justifications for indicated costs and personnel levels. A knowledge-based system, ADP-Estimator, is being developed to estimate project resources and costs. Such knowledge-based software can retain estimating expertise and make it available to other personnel.

38995 **(CONF-880585—1) Asynchronous production systems for real-time expert systems.** Sabharwal, A.S.; Iyengar, S.S.; Weisbin, C.R.; Pin, F.G. (Louisiana State Univ., Baton Rouge (USA); Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 34p. (CESAR—88/08). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88008374/JAW.

From Avignon '88: 8th international workshop on expert systems and their applications; Nanterre, France (30 May 1988).

Intelligent Computing Systems for Autonomous Mobile Robots and Process Control applications require an integration of traditional Expert system technologies with real-time response and control capabilities. To address such requirements, we propose an Asynchronous Production System (APS), which is a rule-based inference engine capable of monitoring and processing asynchronous, real-time information. The primary motivation of the proposed APS is to provide a unique and convenient mechanism for development of rule-based expert systems capable of dynamic and rapid interaction with their environments. This paper elaborates on the architectural, operational and implementational ramifications of Asynchronous Production Systems. To facilitate its description an example of an APS-based, distributed expert system is presented to handle the task of autonomous navigation in the presence of unexpected, moving obstacles in a mobile robot. 26 refs., 10 figs.

38996 **(CONF-880745—1) A comparison study of optimization methods for the bipartite matching problem (BMP).** Goldstein, M.; Toomarian, N.; Barhen, J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 9p. NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88008092/JAW.

From IEEE annual international conference on neural networks; San Diego, CA, USA (24 Jul 1988).

A comparison study of optimization methods for the bipartite matching problem (BMP) with independent random distances between the points is presented. It is concluded that a variant of simulated annealing, developed at ORNL, is the most promising for the BMP. 8 refs., 1 fig., 1 tab.

38997 **(CONF-8608222—1) Algorithm design for high-performance computers.** Dongarra, J.J.; Sorensen, D.C. (Argonne National Lab., IL (USA)). 1986. Contract FG02-85ER25001;AC05-84OR21400;W-31109-ENG-38. 16p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010038/JAW.

From IBM workshop on parallel computing; Oberleck, Austria (11 Aug 1986).

In this paper we look at two ways of constructing algorithms for parallel architectures. The first is based on taking well-understood algorithms and restructuring them to isolate simple, computationally intense modules. We then parallelize the well-defined modules for the specific architecture. In the second approach we develop new algorithms for parallel architectures. Our main emphasis is on algorithms for solving linear algebra problems where the software we develop would reside in a library on high-performance computers. We also discuss a software environment for developing parallel algorithms in Fortran. This environment provides for ease of program development, debugging, and algorithm understanding.

38998 **(CONF-8806149—1) Implementation of an OPS5 derivative on the Novix RISC processor.** Williams, L.C. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 5p. NTIS, PC A02/MF A01; 1; GPO Dep. Order Number DE88011392/JAW.

From Rochester forth conference; Rochester, NY, USA (14 Jun 1988).

The recent popularity of rule-based programming and reduced instruction set computer (RISC) architectures has made the marriage of these two technologies an almost inevitable alternative for applying artificial intelligence (AI) techniques to real-time computing tasks. This paper presents an overview of the software development environment for a rule-based expert-system language based on OPS5 that was written specifically for the Novix NC4016 CPU.

38999 **(CONF-8806154—1) Parallel implementation of the boundary element method.** Drake, J.; Gray, L.J. (Oak Ridge National Lab., TN (USA)). 1988. Contract AC05-84OR21400. 15p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011846/JAW.

From 2. international conference on vector and parallel computing: issues in applied research and development; Tromso, Norway (6 Jun 1988).

In this paper, the issues associated with the parallel implementation of the boundary element method (BEM) on a hypercube will be addressed. The program for solving the three dimensional Laplace equation is specifically adapted for electro-plating simulations; this application involves nonlinear boundary conditions and a time step iteration to follow the development of the plated surface. As a consequence, the coefficient matrices of the potential and normal derivative values are formed separately and stored. A step of the algorithm is thus required to combine and rearrange the system of equations into the standard form $AX = B$. The matrix A is dense and non-symmetric and recent advances in the solution of such systems on a hypercube are employed. Estimates of the arithmetic complexity at each step of the algorithm and a model for the communication costs are used to study the parallel performance of the BEM; timing results are presented for an implementation on an Intel iPSC2/d6 hypercube. The authors conclude that the BEM is particularly well suited for parallel solution and can be implemented efficiently on a hypercube.

39000 **(DOE/ER—0362) Federal Council on Science, Engineering and Technology: Committee on Computer Research and Applications, Subcommittee on Science and Engineering Computing: The US Supercomputer Industry.** (Office of Science and Technology Policy, Washington, DC (USA)). Dec 1987. 180p. NTIS, PC A09;3. Order Number DE88011262/JAW.

The Federal Coordinating Council on Science, Engineering, and Technology (FCCSET) Committee on Supercomputing was chartered by the Director of the Office of Science and Technology Policy in 1982 to examine the status of supercomputing in the United States and to recommend a role for the Federal Government in the development of this technology. In this study, the FCCSET Committee (now called the Subcommittee on Science and Engineering Computing of the FCCSET Committee on Computer Research and Applications) reports on the status of the supercomputer industry and addresses changes that have occured since issuance of the 1983 and 1985 reports. The review based upon periodic meetings with and site visits to supercomputer manufacturers and consultation with experts in high performance scientific computing. White papers have been contributed to this report by industry leaders and supercomputer experts.

39001 **(DOE/ER—0367) FASTBUS standard routines.** (USDOE Office of Energy Research, Washington, DC. High Energy Physics Div.). May 1988. 147p. NTIS, PC A07/MF A01;1; GPO Dep. Order Number DE88010337/JAW.

This document defines standard routines for software access to a FASTBUS system, a standardized modular high-speed data acquisition and control system defined in ANSI/IEEE Std. 960-1986,

published by the Institute of Electrical and Electronic Engineers. It is assumed that the reader is familiar with the FASTBUS system.

39002 **(DOE/ER/25009—522) What have we learnt from using real parallel machines to solve real problems?.** Fox, G.C. (California Inst. of Tech., Pasadena (USA)). Mar 1988. Contract FG03-85ER25009. 58p. (CONF-880117—5). NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88011227/JAW.

From 3. conference on hypercube concurrent computers and applications; Pasadena, CA, USA (19 Jan 1988).

We briefly review some key scientific and parallel processing issues in a selection of some 84 existing applications of parallel machines. We include the MIMD hypercube transputer array, BBN Butterfly, and the SIMD ICL DAP, Goodyear MPP and Connection Machine from Thinking Machines. We use a space-time analogy to classify problems and show how a division into synchronous, loosely synchronous and asynchronous problems is helpful. This classifies problems into those suitable for SIMD or MIMD machines and isolates the asynchronous class as that for which major uncertainties as to possible parallelism exist. Interestingly, about half of the scientific applications run excellently on SIMD machines with the other half able to take especial advantage of the MIMD architecture. 202 refs., 8 figs.

39003 **(DP-MS—88-92) Mobile robotics R & D at the Savannah River Laboratory.** Byrd, J.S. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (USA). Savannah River Lab.). 1988. Contract AC09-76SR00001. 15p. (CONF-8806146—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011665/JAW.

From American Society for Engineering Education annual conference; Portland, OR, USA (21 Jun 1988).

The first teleoperated mobile vehicle was deployed at the Savannah River Plant in 1984 in response to a radioactive spill on the top of a large, outside waste storage tank. Based on the experience with teleoperators, a telerobotic vehicle for use in a wide range of nuclear applications is being developed. This research is briefly discussed and future research directions are touched upon.

39004 **(EGG-M—31887) The apocalypse of Western technology: Transforming American ingenuity into a resource of the Soviet state.** Revo, L.E.; Figelski, G. (EG and G Idaho, Inc., Idaho Falls (USA)). 1988. Contract AC07-76ID01570. 19p. (CONF-880551—2). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88007734/JAW.

From DOE computer security group conference; Kansas City, MO, USA (3 May 1988).

The purpose of this paper is to provide an overview of the threat facing the United States and other Westsern societies from the intelligence services of the Soviet Union and their surrogates among the Eastern European services. We will discuss some of their methodology for acquiring the high technology often lacking in the Soviet Union. We will also outline a basic Operations Security (OPSEC) program, that provides measures for increasing employee awareness of the threat and the consequences which can result from the loss or compromise of classified or sensitive information to those services.

39005 **(EUR—11291) Development and implementation of a pressure propagation code applicable in spherical geometry to euler/isentropic/acoustic modelling. Comparative treatment of shock-up and refection on simplified rigid or elastic obstacles.** Essers, J.A. (Liege Univ., Inst. de Mecanique (BE)). (Commission of the European Communities, Luxembourg). 1987. 92p. NTIS (US Sales Only), PC A05/MF A01. Order Number DE88753958/JAW.

A sophisticated computer code for the calculation of plane or spherical pressure waves and their reflection on a simplified rigid or flexible obstacle has been constructed. Different options: choice of explicit or implicit scheme, use of eulerian, isentropic or acoustic flow models, introduction of different artificial viscosities, use of uniform or non-uniform adaptive grids have been made available and validated by simple shock waves computations. The results from different numerical experiments are presented. They have been used to evaluate the values of artificial viscosity coefficients leading to acceptable pressure pulses. In particular, the following important conclusions have been confirmed: - the linear acoustic model leads to important errors except for extremely weak overpressures; - an excellent accuracy can be obtained with the non-linear isentropic model in a wide overpressure range; - as opposed to the eulerian and to the non-linear isentropic models, the acoustic model is completely uncapable of predicting the shock-up phenomenon, and can therefore lead to important errors in the prediction of the pulse shape even for very weak overpressures.

39006 **(IAE—4288/4) TUBE-1 code for computerized simulation of stres-strain state and kinetics of the RBMK-1000 reactor.** Sergeeva, L.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1986. 14p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701973/JAW.

TUBE 1 program permitting to perform calculated simulation of crack growth kinetics in tubes of RBMK-1000 technological channels with provision for initial residual strains in them has been developed for BESM-6 computer. Possibility of crack propagation according to a hydrogen embrittlement mechanism is investigated. Viscoelastic-plastic behaviour of tube material is taken account of in the process of high-temperature irradiation. Calculation of stress-strained state has been performed according to the finite elements method. 6 refs.; 3 figs.

39007 **(IAE—4400/15) Software of on-line system for calorimetric measurements. BASIC-L interpreter fast-acting.** Tanko, L.; Shikov, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow. Inst. Atomnoj Ehnergii). 1987. 16p. (In Russian). NTIS (US Sales Only), PC A03/MF A01. Order Number DE88701981/JAW.

To exercize control over the automated system of data acquisition, processing and displaying, BASIC-L program package is developed which appears to be a fast-acting supplement to the original BASIC variant. Description of a fast-acting interpreter with a detailed presentation of its command syntax is given. BASIC-L structure is of modular character, i.e. it contains groups of commands with multiple parameters. Software, developed on the basis of a fastacting interpreter, is intended for calorimetric measurement automation. 4 tabs.

39008 **(IFT-P—32/87) Note on the Fermi-Dirac integral function.** Aguilera-Navarro, V.C.; Estevez, G.A.; Kostechki, A. (Instituto de Fisica Teorica, Sao Paulo (Brazil)). 1987. 15p. NTIS (US Sales Only), PC A03/MF A01. Order Number DE88702263/JAW.

A constructive method based on the bypass principle and the Pade approximation technique was used for deducing an implicit analytical expression for the Fermi-Dirac integral function. The simple equation has been found to be remarkably accurate in several fields of physics. (autor).

39009 **(JAERI-M—87-199) Proceedings of the forth seminar on software development in nuclear energy research.** Fujii, Minoru; Osugi, Toshitaka; Harada, Hiroo; Ise, Takeharu (eds.). (Japan Atomic Energy Research Inst., Tokyo). Nov 1987. vp. (In Japanese). (CONF-8709254—). NTIS (US Sales Only), PC A11/MF A01. Order Number DE88780073/JAW.

From 4. seminar on software in nuclear energy research; Tokai, Japan (9 Sep 1987).

Individual papers have been indexed separately. (WRF)

39010 **(JINR—R-10-87-130) Experimental data processing of the JINR nuclear recoil spectrometer on the SM-4 type minicomputer.** Gorshkova, N.L.; Denisenko, K.G.; Murin, Yu.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702182/JAW.

Approach to the processing of nuclear fragmentation data is considered. The possibility to simplify and accelerate data process-

ing on the basis of CM-4 (PDP - 11/34) computers is shown. This acceleration is due to the individual use of processor and peripherals and the simplicity of system software. The use of MES system and MDB software package for work with magnetic tapes with data and obtaining the cross sections for nuclear reaction products is described. 7 refs.; 6 figs.

39011 (JINR—R-10-87-152) Software of a spectrometer with a Ge(Li) detector on-line with the MERA-60/45 and PDP-11/70 computers. Description for users. Tumendemberel, B. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 10p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702183/JAW.

Software intended for processing spectrometric information in oder to study residual nuclear products produced at the fragmentation of atomic nuclei by relativistic nuclear beams of the synchrophasotron is described. The software consists of the following programs operating on the MERA-60/45 and PDP-11/70 computers: SUM, PDPS - for reception and preliminary processing of γ-ray spectra; SM1, SM2, SM3 - for express processing of spectra and nuclide identification. 8 refs.; 5 figs.

39012 (JINR—R-10-87-242) Subsystem for processing, storage and editing of the results of the chamber film scanning. Balgansurehn, Ya.; Dirner, A.; Ivanov, V.G. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation). 1987. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702184/JAW.

A subsystem which is an element of the high-automated system for film data processing and intended for run with the scanning information is described. The subsystem consists of routines which allow to create, to edit and to print the file of scanning results both in batch and interactive mode on the CDC-6500 computer. 6 refs.

39013 (JINR—R-10-87-650) MULTI-FB histogramming program package for acquisition and analysis of spectrometric data on MERA-60 type microcomputer. Nikiforov, A.S.; Smirnov, V.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy). 1987. 6p. (In Russian). NTIS (US Sales Only), PC A02/MF A01. Order Number DE88702457/JAW.

The MULTI-FB system is a version a widely used MULTI program package on which base a software for a number of high energy physics spectrometers has been created. Structure and functioning of software of MULTI-FB system for automated systems and testing stands of electrophysical setups on the base of Mera-60 type microcomputer are described. A list of minimum set of apparatus for MULTI-FB system operation is given, commands of data reception language are described. 9 refs.; 1 fig.

39014 (K/CSD/INF—88/15) Improving software productivity: the selection and administration of GSA's programmers workbench at Martin Marietta Energy Systems, Inc. Verastegui, R.J.; Williams, D.J. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (USA)). May 1988. Contract AC05-84OT21400. 23p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011803/JAW.

Improved software productivity is a vital concern to all data processing organizations. The Computing and Telecommunications Division (C & TD) of Martin Marietta Energy Systems, Inc., is in the process of developing a long-term strategy for software management that has as its major goal the improvement of software productivity. As this strategy evolves, C & TD will evaluate a number of concepts, including software life-cycle methodologies, computer-aided software engineering (CASE) tools, programmers' workbenches, and libraries of reusable software modules. This report focuses on only one of these areas, the programmers' workbench concept. A programmers' workbench links a variety of software productivity tools under one structure. During recent months, C & TD evaluated a workbench available through the General Services Administration (GSA). This product is targeted for the management of existing IBM MVA COBOL application systems. Our experiences with this product have been largely positive, and we intend to use the product as a key component of our overall software management program. This report addresses our experiences with the product to date and our plans for using it in the future.

39015 (LA—11252-MS) Analytical and experimental studies of ventilation systems subjected to simulated tornado conditions: Verification of the TVENT computer code. Martin, R.A.; Gregory, W.S.; Ricketts, C.I.; Smith, P.R.; Littleton, P.E.; Talbott, D.V. (Los Alamos National Lab., NM (USA)). Apr 1988. Contract W-7405-ENG-36. 105p. NTIS, PC A06/MF A01;1; GPO Dep. Order Number DE88010482/JAW.

Analytical and experimental studies of ventilation systems have been conducted to verify the Los Alamos National Laboratory TVENT accident analysis computer code for simulated tornado conditions. This code was developed to be a user-friendly analysis tool for designers and regulatory personnel and was designed to predict pressure and flow transients in arbitrary ventilation systems. The experimental studies used two relatively simple, yet sensitive, physical systems designed using similitude analysis. These physical models were instrumented end-to-end for pressure and volumetric flow rate and then subjected to the worst credible tornado conditions using a special blowdown apparatus. We verified TVENT by showing that it successfully predicted our experimental results. By comparing experimental results from both physical models with TVENT results, we showed that we have derived the proper similitude relations (governed by compressibility effects) for all sizes of ventilation systems. As a by-product of our studies, we determined the need for fan speed variation modeling in TVENT. This modification was made and resulted in a significant improvement in our comparisons of analytical and experimental results.

39016 (LA-UR—88-1166) Building an artificial intelligence capability at Los Alamos. Marinuzzi, J.G. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 5p. (CONF-880393—1). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009155/JAW.

From Artificial intelligence applications for military logistics conference; Williamsburg, VA, USA (29 Mar 1988).

In 1985, after three years of preliminary work, Management of the Los Alamos National Laboratory started an ambitious program to develop a strong technical capability in the rapidly emerging field of Artificial Intelligence/Knowledge Based Systems (AI/KBS). When this AI development program began, except for a few staff members doing basic AI research, AI was essentially nonexistent at the laboratory. The basics, including such things as AI computer hardware and software, literature, books, knowledgeable personnel, or even a general knowledge of what AI was, were most difficult if not impossible to find. For this reason, we had to approach the problem with a very broad perspective, which strongly addressed the basics while aiming toward more advanced AI program elements. Broad, intensive education was the "bootstrapping" tool used in this five year, multi-million dollar AI capability development program. Halfway through the program, our accomplishments indicate that the program is extremely successful. In terms of trained staff, active programs and "state-of-the-art equipment," we have developed one of the strongest AI technical capabilities within the Department of Energy (DOE) and the Department of Defense(DOD). However, a great deal more must be done before the full potential of the program can be realized. 1 fig.

39017 (LA-UR—88-1736) Techniques for developing reliable and functional materials control and accounting software. Barlich, G. (Los Alamos National Lab., NM (USA)). 1988. Contract W-7405-ENG-36. 4p. (CONF-880631—3). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88010926/JAW.

From 29. annual meeting of the Institute of Nuclear Materials Management; Las Vegas, NV, USA (26 Jun 1988).

The media has increasingly focused on failures of computer systems resulting in financial, material, and other losses and on systems failing to function as advertised. Unfortunately, such failures with equally disturbing losses are possible in computer systems providing materials control and accounting (MC&A) functions. Major improvements in the reliability and correctness of systems are possi-

ble with disciplined design and development techniques applied during software development. This paper describes some of the techniques used in the Safeguard Systems Group at Los Alamos National Laboratory for various MC&A systems. 9 refs.

39018 **(LBL—23597) Using common subexpressions to optimize multiple queries.** Park, J.; Segev, A. (Lawrence Berkeley Lab., CA (USA)). Feb 1988. Contract AC03-76SF00098. 10p. (CONF-880245—2). NTIS, PC A02;3. Order Number DE88008210/JAW.

From 4. international conference on data engineering; Los Angeles, CA, USA (1 Feb 1988).

This paper deals with the problem of identifying common subexpressions and using them in the simultaneous optimization of multiple queries. In particular, we emphasize the strategy of selecting access plans for the single queries and their integration into a global access plan that takes advantage of common tasks. We present a dynamic programming algorithm for the selection of individual access plans such that the resulting global access plan is of minimum processing cost. The computational complexity of this algorithm represents a significant improvement over existing algorithms. 25 refs., 11 figs.

39019 **(NUREG/CR—5044) Estimation techniques for common cause failure events.** Kelly, E.J.; Hemphill, G.M. (Los Alamos National Lab., NM (USA)). Mar 1988. Contract W-7405-ENG-36. 50p. (LA—11179-MS). NTIS, PC A03/MF A01 - GPO;1. Order Number TI88011214/JAW.

Common cause failure probability estimation techniques, including β-factor basic parameter, binomial failure rate, multiple Greek, and C-factor estimators, are evaluated and compared using simulation data that captures the real world problem of sparse data from different plants. The effects on the estimators' performances from underlying factors such as common cause shock rates, lethal shock rates, probability of failing given a shock, independent failure rates, and system operational time are discussed. Worst case results are reported, and it is seen that for extremely small common cause failure probabilities the binomial failure rate estimators are best. However, these estimators can underestimate the true probabilities when the failured deviate from the binomial failure rate mode. The β-factor technique is shown to be conservative, and in some cases to overestimate the true probability by several orders of magnitude. When there are observed failutes for each failure event, the basic parameter technique is best and is easily calculated. This estimator is investigated in detail and is used to develop an estimator for the probability of K or more units failing due to a common cause. Uncertainty limits for this probability are also developed.

39020 **(PB—88-192471/XAB) Scheme for translating control flow in the C programming language to Grafcet with examples.** Thomas, B.H. (National Bureau of Standards, Washington, DC (USA)). Mar 1988. 31p. (NBSIR—88/3741). NTIS, PC A03/MF A01.

The purpose of the paper is to show a translation scheme from control flow in the C programming language to the Grafcet language. Grafcet is a graphical language for expressing control flow. Grafcet is used to design parallel systems such as in a manufacturing environment. The control constructs covered in the paper are: conditional statement; while; do; for; switch; break; continue; goto; label; and null. The Grafcet used in the paper is the language, as augmented by Savoir. The C programming language is the one described by Kernighan and Ritchie. The translation is to be used as a reference for programmers to translate existing C source code into Grafcet.

39021 **(SAND—88-0262C) Factorization of large integers on a massively parallel computer.** Davis, J.A.; Holdridge, D.B. (Sandia National Labs., Albuquerque, NM (USA)). 1988. Contract AC04-76DP00789. 9p. (CONF-8805114—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011625/JAW.

From Eurocrypt '88; Davos, Switzerland (25 May 1988).

Our interest in integer factorization at Sandia National Laboratories is motivated by cryptographic applications and in particular the security of the RSA encryption-decryption algorithm. We have implemented our version of the quadratic sieve procedure on the NCUBE computer with 1024 processors (nodes). The new code is significantly different in all important aspects from the program used to factor number of order 10^{70} on a single processor CRAY computer. Capabilities of parallel processing and limitation of small local memory necessitated this entirely new implementation. This effort involved several restarts as realizations of program structures that seemed appealing bogged down due to inter-processor communications. We are presently working with integers of magnitude about 10^{79} in tuning this code to the novel hardware. 6 refs., 3 figs.

39022 **(SAND—88-0451) Maximum entropy signal restoration with linear programming.** Mastin, G.A.; Hanson, R.J. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 34p. NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88011740/JAW.

Dantzig's bounded-variable method is used to express the maximum entropy restoration problem as a linear programming problem. This is done by approximating the nonlinear objective function with piecewise linear segments, then bounding the variables as a function of the number of segments used. The use of a linear programming approach allows equality constraints found in the traditional Lagrange multiplier method to be relaxed. A robust revised simplex algorithm is used to implement the restoration. Experimental results from 128- and 512-point signal restorations are presented.

39023 **(SAND—88-0896) TRINITY II: A post-processing program for two-dimensional finite element analysis data.** Glick, J.H.; Gartling, D.K. (Sandia National Labs., Albuquerque, NM (USA)). May 1988. Contract AC04-76DP00789. 70p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010107/JAW.

TRINITY II is a program for post-processing data from two-dimensional finite element analyses. The program provides graphical display of mesh and solution data as well as data manipulation, file editing and selective printing of data. TRINITY II accepts data from any analysis code that employs the EXODUS file format; post-processing can be done interactively or in batch mode using any graphics device supported by the Sandia Virtual Device Interface. The capabilities and use of the program are described. 4 refs.

39024 **(SAND—88-0952) A comparison of generators for pseudo-random normal deviates.** DeLaurentis, J.M.; Boughton, B.A. (Sandia National Labs., Albuquerque, NM (USA)). Apr 1988. Contract AC04-76DP00789. 12p. NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011711/JAW.

Stochastic models of physical systems often require the generation of a large number of normally distributed random numbers. This investigation studies three different algorithms for generating pseudo-random normal deviates: a method based on the Central Limit Theorem, the polar method and the ratio method. These techniques were chosen because they provide portable generators that are easily implemented in any higher-level programming language. This report shows that all three methods produce reliable statistics, but that the polar method is considerably faster. 3 refs., 1 fig.

39025 **(SAND—88-1420C) Zero-knowledge proofs of identity and veracity of transaction receipts.** Simmons, G.J.; Purdy, G.B. (Sandia National Labs., Albuquerque, NM (USA); Cincinnati Univ., OH (USA). Dept. of Mathematics). 1988. Contract AC04-76DP00789. 15p. (CONF-8805114—1). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88010576/JAW.

From Eurocrypt '88; Davos, Switzerland (25 May 1988).

There are two equally important, related, functions involved in the control of assets and resources. One of these is the verification of a potential user's identity and authority to use or have access to those assets. The other is to provide a record (receipt) of each access so that in the event of a later dispute as to whether an illegitimate use was made of the assets, or of the extent of the liability incurred in a legitimate use, etc., the authenticity and specifics of the access can be demonstrated in a logically compelling (and

hence eventually legally binding) manner to an impartial third party or arbiter. Elaborate, and legally accepted, document based protocols to accomplish these functions are central to all commercial and private transactions. When the resources are remotely accessible, however, as in the case of computer data files, electronic funds transfers (EFT), automated bank tellers, and even in many manned point-of-sale systems, no satisfactory counterpart to the established document based protocols for verifying individual identity and/or authority to use a resource have been found, nor has a fully satisfactory means been devised to provide unforgeable transaction receipts. In this paper, we show how a public authentication channel can be used to certify private (user unique) authentication channels in a protocol that both "proves" a potential user's identity and authority and also provides certified receipts for transactions whose legitimacy can later be verified by impartial arbiters who did not have to be parties to the original transaction. 22 refs.

39026 (SRD-R—369) Recent improvements in CRACUK modelling. Egan, M.J.; Nixon, W. (UKAEA Safety and Reliability Directorate, Culcheth). Aug 1986. 15p. UKAEA Safety and Reliability Directorate, Culcheth. Order Number TI88100002/JAW.

The CRACUK codes is a revised version of the US Consequence modelling code CRAC2, adapted to suit UK applications. This report describes in detail the modifications to the dosimetric models contained within the code, and assesses their influence upon the predicted consequences of postulated atmospheric releases following severe light water and fast reactor accidents. The impact for such source terms is not marked, when compared with existing uncertainty bands, although, for the fast reactor case, the distribution of predicted cancers among the different types is significantly affected. Nevertheless, the improvements lend confidence to the use of CRACUK for the assessment of accidents for a wider range of nuclear plant.

39027 (UCID—21383) Praxis release notes: Version 7.9. Holloway, F.W. (Lawrence Livermore National Lab., CA (USA)). 7 Apr 1988. Contract W-7405-ENG-48. 51p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88009538/JAW.

These release notes are intended as a guide to those responsible for Nova software and users of Praxis at other organizations. They assume previous knowledge of the Praxis language. All improvements and revisions made in this version of Praxis are described.

39028 (UCID—30207-Rev.2) The inter-authentication-domain (IAD) logon protocol (Preliminary specification and implementation guide). Nessett, D.M. (Lawrence Livermore National Lab., CA (USA)). 6 May 1988. Contract W-7405-ENG-48. 64p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010732/JAW.

With the development of computer networking, it has become desirable for users to interact with hosts and distributed operating systems from terminals not directly connected to those systems. Users and the institutions for which they work require distributed interactive services to take advantage of specialized software and hardware as well as economically priced computing capacity. A classical example of this requirement occurs in the ARPANET and it is becoming more widespread as local networks are interconnected. As discussed below, the problem of providing distributed interactive services is complicated by the heterogeneity of the systems involved. This heterogeneity is a characteristic of both the systems themselves as well as of the protocols they support. The general problems of interconnecting such systems have been previously investigated from the perspective of providing distributed interprocess communication [CEKA74,SUNC77]. The framework, the widely used terms internetwork and internetwork system of internetwork node will be used to refer to the heterogeneous environment under discussion. Heterogeneity is only one aspect of the distributed interactive services problem. The variety of situations in which distributed interactive services are required, operational requirements, security considerations, and human-factors requirements also play major roles in defining the exact nature of the problem. 29 refs., 8 figs.

39029 (UCRL—96744) The sub-implicit method: New multiprocessor algorithms for old implicit codes. Eltgroth, P.G.; Seager, M.K. (Lawrence Livermore National Lab., CA (USA)). Jul 1987. Contract W-7405-ENG-48. 12p. (CONF-8708148—4). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011345/JAW.

From Vector and parallel processing in computational science; Liverpool, UK (25 Aug 1987).

This paper presents a new approach to the parallel solution of an implicit system of difference equations. The sub-implicit method operates on sub-regions of the data which are evaluated at spatial points and synchronous time. Each sub-region has a border node which is shared with an adjacent sub-region (in one dimension). Values for this shared node are computed independently by the two solution processes for two adjacent sub-regions. Nodes outside the sub-region are treated as having fixed values during the solution. At the finish of the two sub-region solutions, the two sub-regions are blocked against further changes (a pairwise synchronization) and the two different values for the shared node are reconciled. This can be done in such a way that energy conservation is exact. Results for test problems for heat diffusion in one dimension are given and compared against standard methods and analytic results. Implementation of the method into a demonstration two dimensional hydrodynamics code SIMPLE is described. The best speedups observed for parallel execution of this version of SIMPLE on a twelve cpu Sequent multiprocessor were 9.6 for a 50 by 50 grid and 10.4 for a 95 by 95 grid. Some generalizations of this approach are discussed. 4 refs., 4 figs.

39030 (UCRL—97414) A systolic array for efficient execution of the Faddeev Algorithm. De Groot, A.J.; Johansson, E.M.; Parker, S.R. (Lawrence Livermore National Lab., CA (USA)). 24 Sep 1987. Contract W-7405-ENG-48. 9p. (CONF-8708110—37; CONF-8708110—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011330/JAW.

From 31. SPIE annual international technical symposium on optical and optoelectronic applied science and engineering; San Diego, CA, USA (16 Aug 1987).

The Systolic Processor with a Reconfigurable Interconnection Network of Transputers (SPRINT) is a sixty-four-element multiprocessor developed at Lawrence Livermore National Laboratory to evaluate systolic algorithms and architectures experimentally. The processors are interconnected in a reconfigurable network which can emulate networks such as the two-dimensional mesh, the triangular mesh, the trapezoidal mesh, the tree, and the shuffle-exchange network. The SPRINT's computation capability surpasses its communication capability. Techniques have been developed to perform the Faddeev Algorithm utilizing most of its computing capability by operating on block matrices. These techniques reduce communication bandwidth requirements for a given computation rate and increase efficiency to close to 100%. The Faddeev algorithm calculates the quantity $CX + D$, where X is the solution to $AX = B$, and where A, B, C, and D are given. All quantities are square matrices. Several linear algebra operations such as the matrix-matrix product and matrix inversion can be calculated by loading appropriate values for A, B, C, and D. The Faddeev algorithm is executed on the SPRINT to compare theory with experiment. 7 refs., 4 figs.

39031 (UCRL—97872) A menu-driven menu editor and associated menu system. Preckshot, G.G.; Butner, D.N. (Lawrence Livermore National Lab., CA (USA)). 18 Feb 1988. Contract W-7405-ENG-48. 17p. (CONF-880364—16). NTIS, PC A03/MF A01; GPO Dep. Order Number DE88008026/JAW.

From 7. topical conference on high temperature plasma diagnostics; Napa, CA, USA (13 Mar 1988).

A menu-style user interface has been developed at Lawrence Livermore National Laboratory (LLNL) for distributed control, data acquisition and data processing. A graphical menu editor, which is itself the first application of the menu system, is used to construct or modify menu hierarchies. Unlike many menu systems, no code need be written to demonstrate a set of menus because there are no subroutine calls to make menus; developers need only write the code which performs the actions indicated by user menu picks. In addition to this rapid prototyping feature, the menu

system is integrated with operating system asynchronous traps (in Unix, signals and selects) so that it supports real-time user interfaces for control in a distributed computer system. 4 refs., 3 figs.

39032 **(UCRL—97921) An expert system for automating security incident assessment using OPS5 in an Ada environment.** Canales, T.W.; Smart, J.C. (Lawrence Livermore National Lab., CA (USA)). 29 Jan 1988. Contract W-7405-ENG-48. 9p. (CONF-880464—2). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88011734/JAW.

From Applications of artificial intelligence conference; Orlando, FL, USA (4 Apr 1988).

An expert system that automatically assesses security incidents is being developed at Lawrence Livermore National Laboratory. The expert system associates, classifies, and prioritizes monitored sensor events. The outcome of these processes is a dynamic representation of the state of Laboratory security in the form of security "incidents". A graphical representation of the incidents is integrated into a map-oriented console monitor that provides the operator with a comprehensive view of incidents and their locations. A prototype expert system has been developed using the OPS5 rule-based language. A large Ada-based program provides control of the map display system and interfaces to the various monitoring and access-control devices. In addition to the expert system operation, the issues and methods involved in integrating the OPS5-based incident-assessment system to the large Ada-based control program are discussed. 7 refs., 7 figs.

39033 **(UCRL—97980-Rev.1) On the implementation of applicative languages on shared-memory, MIMD multiprocessors.** Lee, Ching-Cheng; Skedzielewski, S.; Feo, J. (Lawrence Livermore National Lab., CA (USA)). 27 Apr 1988. Contract W-7405-ENG-48. 10p. (CONF-880731—1-Rev.1; CONF-880731—). NTIS, PC A02/MF A01;1; GPO Dep. Order Number DE88009823/JAW.

From Computing machinery sigplan symposium: experience with applications, languages and systems; New Haven, CT, USA (19 Jul 1988).

This paper presents the performance of a set of algorithms written in SISAL [MSA*85] and run on multiprocessor Sequent, DEC, and Cray computers. We describe our current runtime system and discuss its implementation on each machine. We indicate where our automatic approach to parallelization works well, as well as sources of inefficient behavior. Overall we find our systems encouraging for the first release of the native-code generating software. We suggest improvements to the compiler and runtime systems, many already developed but not yet implemented, to alleviate the inefficiencies. 12 refs., 3 figs., 3 tabs.

39034 **(UCRL—98638) A fast vortex code for computing 2-D flow in a box.** Baden, S.B.; Puckett, E.G. (Lawrence Livermore National Lab., CA (USA)). 29 Jun 1988. Contract W-7405-ENG-48;AC03-76SF00098. 21p. (CONF-880716—6). NTIS, PC A03/MF A01;1; GPO Dep. Order Number DE88011732/JAW.

From 1. national fluid dynamics congress; Cincinnati, OH, USA (24 Jul 1988).

We present a fast, accurate hybrid vortex method for computing incompressible, viscous flow at large Reynolds numbers in a two-dimensional bounded domain. The random vortex method is used to model the flow away from the boundary and the vortex sheet method is used to model the flow near boundary. Our implementation of these methods exploits the localized nature of interactions among vortex elements in each of the respective regions of the domain. A local corrections approximation is used to accelerate the velocity computation in the interior. It is substantially faster than other methods of comparable accuracy and can economically handle tens of thousands of vortex elements. We evaluate the method on the flow in a box due to a central stationary vortex. The running time for this problem is rougly linear in the number of vortex elements and results are in good qualitative agreement with other numerical solutions of the same problem.

39035 **(WAPD-TM—1619) TRANSL: A PATRAN translator subroutine library.** Butler, K.M.; Caldwell, C.S. (ed.). (Bettis Atomic Power Lab., West Mifflin, PA (USA)). May 1988. Contract AC11-76PN00014. 54p. NTIS, PC A04/MF A01;1; GPO Dep. Order Number DE88010976/JAW.

The TRANSL subroutine library enables a programmer to easily interface and translate engineering models developed using PATRAN interactive graphics software to engineering analysis computer programs, typically executed on large mainframe computers. PATRAN is a powerful program which greatly simplifies the tasks of generating two- or three-dimensional geometry models, creating finite element grids, and applying boundary conditions. In order to use a model created in PATRAN in any analysis program, a translator must be written to convert the model from the PATRAN neutral file format into an input format specific to the analysis program. TRANSL is a versatile FORTRAN-77 subroutine library implemented on VAX computers which performs activities common to any interactive PATRAN translator. Its capabilities include reading specified PATRAN neutral file data into memory, sorting neutral file data and general arrays, searching for a specific piece of information, communicating with the user, and file handling. A session file for automatic submission of input in a later translator session and a print file containing all communication with the user may be automatically generated. The driver for the TRANSL subroutine library is a program which reads all data from the neutral file into memory and writes it out again in the same format. This program demonstrates the use of TRANSL subroutines for developing a PATRAN translator and provides a means for testing the TRANSL subroutines. 4 refs.

39036 **(WAPD-TM—1620) PATFID: A translator from PATRAN to FIDAP.** Butler, K.M.; Caldwell, C.S. (ed.). (Bettis Atomic Power Lab., West Mifflin, PA (USA)). May 1988. Contract AC11-76PN00014. 73p. NTIS, PC A05/MF A01; GPO Dep. Order Number DE88010977/JAW.

PATFID is an interactive program which translates a model developed in the interactive graphics program PATRAN into an acceptable format for the fluid dynamics program FIDAP. The engineer wishing to analyze a problem in fliud flow or heat conduction first uses PATRAN top create a finite element model consisting of nodes, elements, and boundary conditions, following the instructions provided in this manual. The PATRAN neutral file containing this model is then supplied to PATFID, which prompts the user for all additional information needed for FIDAP. The specific questions that the user is asked depend upon the nature of the model developed in PATRAN and upon answers to previous questions. A print file, containing all messages to and from the user, and a session file, which can be used to supply user responses in a later run, are automatically generated by PATFID. The output file from PATFID is a complete and internally consistent input file for the FIDAP pre-processor FIPREP. PATFID is a FORTRAN-77 program implemented on VAX computers. It will translate any neutral file appropiate for FIDAP created by any version of PATRAN at least up to 2.0 into the FIPREP input file for Version 3.0 of FIDAP. Fluid problems which can be prepared for FIDAP using PATFID include two- and three-dimensional problems with pressure, heat flux (including radiative and convective flux), velocity, and temperature boundary conditions and velocity and temperature initial conditions. PATFID utilizes subroutines from the TRANSL subroutine library for PATRAN translators. 8 refs., 5 figs., 0 tabs.

39037 **(Y/DW—772) Computer integrated manufacturing implementation at the Oak Ridge Y-12 Plant: The sixth year of a ten-year plan.** Bowers, G.L.; Harper, H.E. (Oak Ridge Y-12 Plant, TN (USA)). 7 Oct 1987. Contract AC05-84OR21400. 12p. (CONF-880486—1). NTIS, PC A03/MF A01; 1; GPO Dep. Order Number DE88008222/JAW.

From Automated manufacturing exhibition and conference; Greenville, SC, USA (12 Apr 1988).

The strategic and operational plans for the computer integrated manufacturing (CIM) program in the Y-12 Plant are providing for the evolution of the plant's CIM infrastructure from today's environment to the integrated, highly flexible, and more responsive manufacturing systems planned for the 1990s. The program is committed to meeting the CIM directives established by the US Department of Energy and providing the means by which operations

can improve the manufacturing performance of the Y-12 Plant. The plant's CIM program charter is a commitment to coordinating efforts to implement and integrate CIM technologies to improve manufacturing performance and thus significantly enhance the plant's ability to meet current and future manufacturing objectives. To achieve these objectives, CIM technologies are being applied to automate manufacturing processes and information systems. 1 ref., 1 fig.

39038 **Predicting multiprocessing efficiency on the Cray multiprocessors in a (CTSS) time-sharing environment/application to a 3-D magnetohydrodynamics code.** Mirin, A.A. (National Magnetic Fusion Energy Computer Center, Lawrence Livermore National Laboratory, P. O. Box 5509, L-561, Livermore, California 94550). *Computers in Physics;* **2**: No. 4, 62-67(Jul 1988).

A formula is derived for predicting multiprocessing efficiency on Cray supercomputers equipped with the Cray Time-Sharing System (CTSS). The model is applicable to an intensive time-sharing environment. The actual efficiency estimate depends on three factors: the code size, task length, and job mix. The implementation of multitasking in a three-dimensional plasma magnetohydrodynamics (MHD) code, TEMCO, is discussed. TEMCO solves the primitive one-fluid compressible MHD equations and includes resistive and Hall effects in Ohm's law. Virtually all segments of the main time-integration loop are multitasked. The multiprocessing efficiency model is applied to TEMCO. Excellent agreement is obtained between the actual multiprocessing efficiency and the theoretical prediction.

39039 **Realizing fault-tolerant interconnection networks via chaining.** Tzeng, N.F.; Yew, P.C.; Zhu, C.Q. (Center for Advanced Computer Studies, Univ. of Southwestern Louisiana, Lafayette, LA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Computers;* **37**: No. 4, 458-462(Apr 1988).

A scheme applicable to a wide class of multistage interconnection networks to enhance their fault-tolerant capability is proposed. Multiple paths between each input-output pair of a network are created by connecting together switching elements within the same state. This scheme provides a network with alternative paths at every stage, requires a simple self-routing algorithm, and allows a network to become more robust as its size increases. An analysis is performed to obtain a quantitative measurement on the reliability improvement of the scheme.

39040 **A new technique for solving nonlinear differential equations encountered in modeling of neuroreceptor-binding ligands.** Huang, S.C.; Bahn, M.M.; Phelps, M.E. (Div. of Nuclear Medicine and Biophysics, Dept. of Radiological Sciences, and Dept. of Biomathematics, UCLA School of Medicine (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 762-766(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

For assessing neuroreceptor density with positron emission tomography (PET), nonlinear differential equations consisting of products of the tracer concentrations are needed to describe the tracer kinetics of receptor binding ligands. The authors have investigated an iterative solution technique for this type of nonlinear differential equations. The technique involves solving iteratively a sequence of linear differential equations that is related to the original nonlinear differential equation. The sequence of solution of these linear differential equations converges to the solution of the nonlinear differential equation. The technique is faster and more accurate than Runge-Kutta numerical integration technique. The solution technique can facilitate the investigation of the tracer kinetic characteristics of neuroreceptor-binding ligands and the estimation of neuroreceptor density from PET collected kinetics of receptor-binding ligands.

39041 **Overview of robotics at Los Alamos National Laboratory.** Knobeloch, D.W. (Los Alamos National Lab., NM (USA)). pp vp of 194th national meeting of the American Chemical Society, Division of Analytical Chemistry Newsletter. Washington, DC; American Chemical Society (1987). (CONF-8708245—).

From American Chemical Society Division of Analytical Chemistry meeting; New Orleans, LA, USA (30 Aug 1987).

The Robotics Section of the Mechanical and Electronic Engineering Division has a programmatic effort to implement robotics and automation at Los Alamos National Laboratory. The primary objective is to apply robotics to select areas of nuclear materials handling and processing operations. The overriding impetus is the reduction of low-level radiation exposure to operating personnel. These goals are being realized by employing industrial and laboratory robots to develop automation and robotic systems to process nuclear materials. Since the robotics industry focuses on major production markets, the nuclear industry related problems such as equipment sized for glovebox operation, construction materials that are radiation and corrosion resistant, and determining which systems will operate in corrosive and/or inert atmospheres need to be addressed. The Robotics section has realized several of these major goals and is now beginning to apply robotic technology to other research efforts at Los Alamos. These new initiatives include: the design of a custom gantry robot; automation of molecular biology processes in support of the Human Genome Project; use of artificial intelligence and knowledge based systems; automation and robotics for the planned Space Station mission; and other areas of research and development.

39042 **Numerical resolution of front phenomena by regridding techniques.** Degreve, J.; Dimitriou, P.; Puszynski, J.; Hlavacek, V.; Valone, S.; Behrens, R. (Dept. MST-3, Los Alamos National Lab., Los Alamos, NM (US)). pp 376-403 of Supercomputer research in chemistry and chemical engineering. Jensen, K.F.; Truhlar, D.G. Washington, DC; American Chemical Society (1987). (CONF-8703229—).

From Symposium on supercomputer research in chemistry and chemical engineering; Minneapolis, MN, USA (16 Mar 1987).

Solutions to models with different length scales may contain regions such as shocks, steep fronts, and other near discontinuities. Adaptive meshing strategies, in which a spatial mesh network is adjusted dynamically so as to capture the local behavior accurately, are described. The algorithm is tested on an example of filtration combustion.

39043 **(AD-A—190305/3/XAB) Expert-system enhancement to the resource-allocation modules of the NCS Emergency Preparedness Management Information System (EPMIS). Final report.** (Delta Information Systems, Inc., Horsham, PA (USA)). Jan 1987. 196p. NTIS, PC A09/MF A01.

Availability: Document partially illegible.

This document summarizes work performed by Delta Information Systems, Inc., for the Office of Technology and Standards of the National Communications System, an organizations of the U.S. Government, under Contract number DCA100-86-C-0099. The Office of Technology and Standards, headed by National Communications System Assistant Manager Dennis Bodson, is responsible for the development of advanced technology for the NCS. The Office of the Manager, NCS requires timely, accurate information about the status of communications resources during national emergencies and declared disasters. This led to the realization that an automated decision support system would be useful to NCS Emergency Management Teams, which play a significant role in the monitoring and resolution of such situations. The Emergency Preparedness Management Information System (EPMIS) is an integral part of the National Emergency Telecommunications Management System, which is designed to allow the Manager, National Communications System (NCS) to respond to declared national emergencies.

39044 **(AD-A—190350/9/XAB) NATO Scientific and Technical Information Service (NSTIS): functional description. Final report.** Molholm, K.N.; Blados, W.N.; Bulca, C.; Cotter, G.A.; Cuffez, A. (Defense Technical Information Center, Alexandria, VA (USA). Office of Information Systems and Technology). Aug 1987. 173p. (DTIC/TR—88/6). NTIS, PC A08/MF A01.

This report provides a functional description of the requirements for a NATO Scientific and Technical Information Service (NSTIS). The user requirements and much of the background information in this report were derived primarily from interviews with more than 60 NATO Headquarters staff members between 2 March and 25 March 1987. In addition, representatives of the Supreme Headquarters Applied Powers Europe (SHAPE) Technical Centre (STC), the Supreme Allied Commander Atlantic (Anti-Submarine Warfare Research) Centre (SACLANTCEN), the NATO Communications and Information Systems Agency (NACISA), The Advisory Group for Aerospace Research and Development (AGARD), the U.S. Defense Technical Information Center (DTIC), and the Technical Documentation Center for the Armed Forces in the Netherlands (TDCK), were interviewed, either in person or by telephone.

39045 **Wide band data transmission system using optical fibers.** Leskovar, B.; Nakamura, M.; Turko, B.T. (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA (US)). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Nuclear Science;* **35**: No. 1, 334-341(Feb 1988). (CONF-871006—).

From 34. nuclear science symposium and 19. nuclear power systems symposium; San Francisco, CA, USA (21 Oct 1987).

An ultra high speed data transmission system using optical fibers and gallium arsenide digital integrated circuits has been investigated. The system is designed to meet the increased data rate requirements of modern information processing systems as well as those of future imaging devices and high spatial resolution detectors. A description of the system which uses available components made for the transmission and reception of data at 780 Mbit/s rates is given. Methods for digitizing, multiplexing, demultiplexing, error checking, etc. are also described, and a discussion of the reliability of components is presented.
